The stereochrome or water-glass process consists in spraying the painting after completion with a warm dilute solution of potash silicate, or potash-soda silicate, which is obtained by fusing the purest sand obtainable with carbonate of potash or carbonate of soda. The pigments themselves are mixed with some of the fixing liquid. This form of painting is a German invention of comparatively recent date; it has not been frequently used in this country, and we have very little experience of its behaviour.

In the consideration of the possibilities of tempera painting we find ourselves on surer ground, no longer so fearful of the consequences of the contaminated atmosphere of our towns. I am glad to be able to read you a few words I have received from Sir William Richmond as to this medium, which he used on the walls of a modern church at Cheltenham a few years ago. He says:—

"The wall was prepared with lime and sand, the final *intonaco* was in marble dust and well-slaked lime, and it was wonderfully white. The whole design was drawn in charcoal, corrected with care. Egg, Capri wine and powder colours were used. The yoke of egg alone was used, plenty of wine and distilled water. The first painting should be in what the Italians called 'Verdaccio,' namely, raw siena (black and white), with plenty of impasto. In two hours this can be glazed with warm colour and painted into. I am quite certain that the yoke of egg and wine form the very best and most durable medium for wall-painting. Most of the Italian wall-paintings which have lasted were not painted in fresco but in the tempera of yolk of egg, the essential oil of which is a most powerful binding liquid, enabling the painting to dry like a rock."

From a paper by Gerald C. Horsley, read before the Applied Section of the Society of Arts.

\* I am indebted to Professor Church's *The Chemistry of Paints and Painting* for this description.

Sir William further says:—"I prefer yolk of egg and wine even to buon fresco; the colour is almost as pure, not quite so light, and if it is necessary to get rich colour, the medium will give it to any extent."

Professor Church, speaking of the large amount of oil in the egg yolk, says, "This vehicle does not act so effectually as oil and varnish in locking up pigments, and so the protection against change which it affords is less." But I think we may take it that the protection is certainly considerable, while the old method of varnishing the painting with sandarac in oil affords further protection against moisture and impure air.

The well-known spirit fresco, invented by the late Mr. Gambier Parry, differs little from ordinary oil-painting on account of the large quantity of oil in the copal, which forms so much of the medium, the constituent parts of which, I may remind you, are only multiples of these proportions, viz:—

Gum elemi or elemi resin	ozs.	2
Pure white wax (beeswax)		4
Oil of spike lavender		8
Finest preparation of artists' copal		20

With this medium incorporated by heat all colours in dry powder are mixed. It appears that Mr. Gambier Parry gave the name of spirit fresco to the method because oil of spike and turpentine may be freely used as liquids during the process of painting. The beeswax secures, of course, a perfectly matt, or dead surface, but it is liable to produce a kind of bloom in the course of years, and may wholly disappear in the course of time.

Besides the paintings by Mr. Gambier Parry at Higham and Gloucester Cathedral, Lord Leighton's "Arts of War" and "Arts of Peace" at South Kensington and seven paintings by Ford Madox Brown in the town hall of Manchester are examples of this method. They appear to be standing well, though we may expect them to darken, and there are a few signs of the bloom referred to above in the "Arts of Peace."

Professor Church considers that a sound medium is to be found in the proportions of

Oil of spike	ozs.	12
Paraffin wax		4
(The two mixed by heat.)		
Copal picture varnish		20

He advises the pigments being mixed in blown linseed oil rather than in the medium itself, as Parry recommends.

I need not do more than allude to Parry's Ely medium. Briefly it is:—One part pale drying oil; one part strong copal varnish; two parts japanner's gold size; two parts turpentine, and the powder colours to be ground up in the medium. It is just oil-painting over again, with the gold size to give the necessary deadness of surface. He painted the eastern part of the nave, wooden roof, also the octagon and transept ceiling, at Ely Cathedral in this medium.

I have dwelt on the component parts of these wax and oil mediums in some detail, as it is but a step from them to the method which is generally adopted by painters to-day. I refer to the prevalent custom of painting in oil on canvas and then, on completion of the picture, having it fixed, or marouflé, as the French call it, to the wall or ceiling; that is to say, the canvas is fixed by means of a thick paste of white lead, oil and copal varnish, spread upon the wall and simultaneously upon the back of the canvas.

The French painters in the beginning of the nineteenth century, like their German brethren in Munich, painted mural works in fresco, but they were already beginning to discard the practice when we in our wisdom were working in it at Westminster. They also used encaustic painting (Delaroche's *Hemicycle* in the Ecole des Beaux-Arts is an example), but since 1870 the most important works have been painted on canvas fixed in the way I have described; such are the great wall-paintings by Puvis de Chavannes in the Panthéon, in the museums of Amiens, Rouen and Lyons, the Sorbonne, and the library in Boston.

This too is the method adopted in the Royal Exchange at Liverpool, at Glasgow, and by Messrs. J. S. Sargent, R.A., and E. A. Abbey, R.A., in the library at Boston.

Without going deeply into technicalities which would naturally vary with each painter, the colours used are simply oil-colours, with a medium of wax and turpentine. Professor Moira, who has painted in this way at the New Renshaw Street chapel in Liverpool, and at other places, tells me he likes the canvas to be fairly coarse and open, so that there should be no hindrance to the fixing material incorporating itself with the colours laid on. This is better achieved by doing the first painting only in the studio, and completing it *in situ* after it has been fixed upon the wall or ceiling. The painting of the picture *in situ* in this way will I am sure commend itself to all as a most important side of this system of decoration. It is understood that some of the modern works I have named have been painted entirely in the studio; corrected in many cases no doubt when in position. But as a practice it must surely

carry with it its own condemnation. Although scale drawing and models may be made with the utmost care, and cartoon in full size tried in position, all of which should be done, and invariably are done before the painting is begun, unless the work, or at least the major part, is carried out in the building, it is not possible for the painter to be confident as to the correctness of his scale, or what is more important in its difficulty, of his colour. Both these elements, more particularly the last must surely be influenced by the size and lighting of the building, an intimate knowledge of which is revealed by working it. Are we to suppose that the ceiling of the Sistine Chapel would have been as magnificent as it is if it had been painted by Michel Angelo in a studio and then fixed in position? To confess the very thought is sacrilegious, and I tremble suggesting it.

In this connection I am reminded of a painting on canvas in St. Alban's, Holborn, which was painted chiefly on the wall where by its position in a dark corner of a church certain colours had to be used which are startling in what would be their inappropriateness in a better light. For instance, in order that the hair of the Saviour, one of the figures in the composition, should appear brown, pure vermilion had to be largely used; ordinary light brown appeared black.

But it is unnecessary to multiply instances, and I will venture therefore only to suggest that as in most cases the position of the painting directs the colour to be used, it is desirable that it should be as far as possible painted *in situ*.

It is to be hoped that the convenience of this modern method of painting on canvas will not deter painters from working directly on the plastered wall in tempera, oil, or encaustic. If the beautiful qualities of fresco are denied in this country, there are yet the qualities inseparable from plaster ground, which a canvas surface can never present in the same way.

Design I need not touch upon. There is no excuse for bad work, surrounded as we all are by the highest example. A fine translation of modern life appears to be growing in mural painting of the great type and is heartily to be welcomed. In this connection I would draw attention to Mr. Furse's work at Liverpool and some of the work at Glasgow while in allegory we have the great work of Mr. Sargent at Boston. In setting ourselves a standard we may remember perhaps the words of Puvis de Chavannes:—"Tout décoracion ne peut être belle que dans la mesure où elle reflète la nature et en traduit la passion."

## TESSERÆ.

### Antique Vases.

THE precise time at which the use of painted vases as ornaments for tombs ceased cannot be determined, but the cessation of the custom must have been followed by the discontinuance of the manufacture. The cessation of the custom has been accounted for and been connected with various occurrences in the history of Italy. Some have thought that the Social War, which destroyed so much of Greek civilisation in Italy, also put an end to the manufacture of these painted vases; others suppose that the suppression of the Bacchic mysteries by the Senatus Consultum de Bacchanalibus was the cause of painted vases being no longer deposited in the graves. The groundlessness of this opinion has been satisfactorily proved by Kramer ("Ueber den Styl und die Herkunft der bemalten Griech. Thongefässe," p. 137, &c.), who is inclined to believe that the custom gradually ceased at the time when the Roman sovereignty was established in Italy and Sicily. As the Romans themselves had never adopted the custom, it is not improbable that their influence, without an definite enactment for the purpose, put an end to the custom in Italy and Sicily. Kramer thinks that there are no painted vases of a later date than the second Punic war. The question as to the place or places where such painted vases were manufactured was never raised, and was not indeed of great importance, until immense numbers of them were found in Etruria. The question then became of no small importance, as it is intimately connected with the whole history of ancient civilisation for in the place or places where these vases were produced the taste for real artistic merit must have been much more widely spread than in any place of modern times. That all the painted vases are of Greek origin is now no longer a matter of doubt, and is sufficiently attested by the subjects represented on them, as well as by the Greek inscriptions, although the precise meaning of some of the paintings and inscriptions will perhaps remain undiscovered. All the opinions which have been set forth in regard to the origin of the painted vases found in Etruria may be divided into two great classes: the one is that they were manufactured in the country where they are found; and the other, that they were imported from a foreign country or countries. Those who maintained the former opinion believed either that there was in Etruria a considerable Greek

lation (Tyrrhenians), among whom vase-manufactories established, and that afterwards this Greek population absorbed and overwhelmed by the Etruscans; or that existed at Volci in Etruria one or more corporations of vases who were in close connection with Attica. Those who held that the vases were imported from foreign parts again as to the place or places where they were manufactured, from which they were exported. Some have regarded others Athens or the Chalcidian colonies in Campania, especially Cumæ and Nola, as the places where they were manufactured; but most of these opinions are opposed to well-known historical facts, and supported by very weak arguments; others are mere hypotheses, formed only because their authors felt the necessity of fixing upon some place or other as one from which these vases came into Etruria.

### Ecclesiastical Architecture.

Architecture is, in many of its capabilities, the most religious of the fine arts, the most suited to the expression of the ideal, the impalpable, the mysteriously sublime; for whilst painting and sculpture the images of things familiar are created, and the actual world, if idealised, is still the subject of the artist, architecture receives its interpretation from no analogies to the reality of our daily life, but from a perception the most deeply seated within the soul of spiritual and eternal objects, inaccessible to faith but inconceivable to sense. Whether the question of Christian architecture has been reached in Rome or not to be actually decided till a canon has been recognised as positively defining that perfection. The majority, at least of northern birth, will answer to it in the negative, and maintain that disappointment, even in regard to the most splendid Christian edifices of that city, very generally attends the visitor if not the abiding impression made on this class of visitors. Modern visitors have a predilection for Gothic architecture, the most genuine and appropriate offspring of Christianity surpassing, in many peculiarities, all other forms of architecture, in the expression of the mysteries of faith. But there is often unreasonableness in an advocacy which demands the universal adoption of the same system without distinction of clime or nationality. It is surely not more to be justified when the question is of architecture than if it were of popular music, or the habits and conditions of social life. The spirit that can only recognise the ideal or beautiful in a given form approaches the bounds that separate enthusiasm from bigotry—enthusiasm (in the true sense of the word, the divine within us) responds to all high ideals, and arrives at the profound meanings of all that art has created, through whatever medium. Bigotry, for its part, in the direction of taste this may appear, refuses admiration or sympathy to all that does not conform with one standard, harmonise with one idea. As the governments, institutions and literature of different countries are and must be distinct; as the influences of climate, the qualities of soil, together with the events of primeval history and traditions of a country concur in marking with its peculiar stamp each member of the family of nations, so the acceptance even of identical religious principles will be various, as far as it affects feeling declares itself in outward signs, among various nations. Christian religion does not destroy individuality in nations more than in men, but by raising the human to the divine, every faculty of mind to its acme of excellence, every latent tendency of talents or genius to the ultimate of power; great Author and Source of all gifts may be served alike acceptably through operations of intellect and forms of art only distinct from each other.

### The Story of Psyche in Art.

Illustrations of the story of Psyche have been found on Egyptian monuments prior to the age of Apuleius, whose book of the "Golden Ass" is the only ancient authority for it existing in writing; but we must suppose that author to have at least developed and improved upon it, otherwise it is incredible that people like the Greeks could have so little regarded this fascinating fable as to leave it uncelebrated in their poetry or religious practices. Christianity was beginning to extend its triumphs when Apuleius wrote; and this story may be regarded as one of many efforts to spiritualise Pagan belief, to give it a deeper meaning which might satisfy the requirements of the soul wakening to the perception of lofty truths, at this momentous era of moral transition. It contains the idea, never dimly shadowed forth, of the leading features in the development (as one might call it) of Christianity. The fall of the soul from bliss through weakness to temptation; its subjection to the ordeal of self-entailed suffering; its restoration through the interposition of divine love, and final entrance into the inheritance of immortality. As Apuleius has narrated it, supplies inexhaustible matter for the artist and the poet, and the varied incident and rich descriptive colouring of the fable, the mystic beauty of religious allegory, and the dramatic imagery and effective grouping of the artistic novel.

### Ancient Art.

The remains of ancient art which have come down to us show clearly, notwithstanding here and there an example to the contrary, that the intent and purport of the artists was to raise the populace intellectually, to excite them to deeds of patriotism and valour, and to love of the noble and heroic. The contention of Neptune and Minerva which should most benefit mankind, the labours of Hercules, the maternal affection of Niobe, are subjects the contemplation of which must elevate the character of a people, and are alone sufficient to prove that the value of the arts, as a means of advancement, was both understood and appreciated; the lesson, too, which art conveys by portraying heroic virtue was increased in force by showing the opposite side of the page; vice was exhibited, as in the instance of their Silenus and Satyrs, in its most natural as well as most expressive and abhorrent forms. Men were taught, while looking at them, that by the practice of vicious habits they lowered themselves to an equality with the beasts of the field, connected themselves with them both in form and character, assumed essentially, if not positively, the likeness of inferior creation. We might go further in our argument for the well-working of art in ancient Greece; we might descend from the beautiful fables under which her moral code of laws was veiled, and ask the reader to remember that the statues of her warriors and heroes, her poets, orators, and philosophers, erected in such numbers in her public places, their forms idealised, while their names were deified, to meet the belief that the beautiful in person was indicative of the noble in mind, served to raise in the beholders a spirit of emulation, a desire to obtain the like honours by the like means. The same feeling pervaded Roman art; courage in war was instilled into the people by the figures of their generals; bodily energy and activity by the statues of the victors in the games; Roman stoicism by the suppressed agony of the dying gladiator.

### The British Museum in 1784.

William Hutton, of Birmingham, has been called the English Franklin, and his shrewdness in small affairs recalled the American. But he was never engaged in political enterprises like the revolution which ended in the independence of the United States. Among his numerous writings is an account of a journey to London in 1784. One passage in it will suggest the difficulty of visiting the collections in the British Museum. Hutton said:—"The British Museum justly stands in the first class of rarities. I was unwilling to quit London without seeing what I had many years wished to see. I was given to understand that the door, contrary to other doors, would not open with a silver key, that interest must be made some time before, and admission granted by a ticket on a future day. This mode seemed totally to exclude me. By good fortune I stumbled upon a person possessed of a ticket for the next day, which he valued less than two shillings. We struck a bargain and were both pleased. We assembled on the spot about ten in number, all strangers to me, perhaps to each other. In about thirty minutes we finished our silent journey through this princely mansion, which would well have taken thirty days. It grieved me to think how much I lost for want of a little information. I went out much about as wise as I went in, but with this severe reflection, that for fear of losing my chance, I had that morning torn myself from three gentlemen with whom I was engaged in an interesting conversation, had lost my breakfast, got wet to the skin, spent half a crown in coach-hire, paid two shillings for a ticket, been hackneyed through the rooms with violence, had lost the little share of good humour I brought in, and came away quite disappointed. Hope is the most active of all the human passions; it is the most delusive. I had laid more stress on the British Museum than on anything I should see in London. It was the only sight that disgusted me." In 1759 the Museum was opened for public use, and in 1784 it could not be considered to be too new for the admission of provincial visitors. Montagu House was not overcrowded, for it was not until 1807 that extensions became necessary. Hutton's experience therefore confirms the belief that at the close of the eighteenth century knowledge was considered to be a privilege of the few, and the contents of the British Museum were on that account jealously guarded.

### Beauty in Art.

By beauty in art is meant not merely beauty in its limited sense, as applied to woman, but in its wider and more comprehensive one, as expressing abstract perfection of form, and that complete fitness to purpose ever found in the works of nature generally, though not always carried out by her to its utmost extent in individual examples. Though we all feel and estimate beauty, it is difficult to give any very accurate definition of it; the expression, "fitness to purpose," is not novel, and though well understood, by no means comprehends an entire or complete explanation of the term; for though in nature adaptation to purpose and beauty are so combined that

the carrying out of the one to perfection often involves the complete presence of the other, yet the lower orders of creation have forms thoroughly suited to their capacities, the perfection of which by no means conveys a pleasurable sensation to the eye. As beauty, however, is at the best but a question of comparison, dependent much on the power of receiving impressions, it may be urged that these are not exactly exceptions to the rule, but are to be measured by a scale too low to be appreciated by the human eye, yet not so low but that they may afford gratification to more confined faculties. Beauty, as applied to the lower orders of beings, is of a more limited kind than when applied to man: the purposes for which they are created, the destinies which they are called on to fulfil, the sphere they have to move in being more restricted; certain qualifications or faculties suitable to the tasks they have to perform and adapted to their wants are therefore found in them in such force or perfection as to predominate over all others, and to become in the animal itself the essence of its existence. Strength, fleetness, keenness of sight or scent, courage or caution, capability of bearing fatigue or of suffering deprivation, the power of moving with facility in particular elements, the adaptation of outward form and surface, as well as inward construction, to life and enjoyment in certain climates and under peculiar influences. The beauty of man, partaking, as he does, in a degree of all the physical qualifications which each portion of the lower orders possesses singly, and as having superadded to them the superior one, reason, is of a higher and more complicated kind. In him is found that concentrated essence of form, in which the highest powers of body and mind are comprised within the least possible dimensions. To the representation of man, therefore, the sculptor naturally turns as affording him the widest sphere for his art, and as enabling him to carry out its intentions in the highest degree, and it follows that the perfect representation of perfect human form is the most difficult task he has to execute, containing, as it does, beauty in its purest and most elevated character. By the study of the human structure, and by comparison of it with those animals which possess in a high degree the single qualifications so happily concentrated therein, the sculptor is enabled to decipher its laws and principles and so select from imperfect individual instances those phases which, when united and separated from extraneous matter, constitute perfect beauty or thorough fitness of purpose.

#### George Maddox.

George Maddox, an architect of much original talent, died on October 5, 1843, at the age of eighty-six. He was the instructor of Professor Cockerell, R.A., Decimus Burton, Professor Hosking, and many other eminent men. For thirty years of the latter part of his life he devoted himself to teaching, and he thereby exerted, though indirectly, a considerable influence on architectural taste, more especially as his was not a mere routine system of instruction. He could hardly have been said to have belonged to the old school, since he held it rather in contempt, as he likewise did all the superficial jargon of its criticism. His opinions must have at one time been deemed not a little heretical, but he lived long enough to find them gaining ground, and that architecture was studied in a better and more intelligent spirit than in his earlier days. He was a member of the Society of British Artists from its commencement, and a constant contributor to the exhibitions, frequently displaying many happy as well as original ideas. Some years before his death he undertook a series of etchings, consisting of capitals, entablatures, and a variety of architectural ornaments picturesquely grouped together; therefore of a very different character from the usual "books of ornaments," but increasing infirmities and severe indisposition prevented him from completing his work.

#### GENERAL.

**Mr. R. C. Bosanquet**, the director of the British School of Archaeology, has left Greece for Crete with the object of carrying out excavations at Palaëocastro, a promising site at the eastern extremity of the island. The excavations will be carried out at the expense of the British School, public subscriptions for Cretan research having proved inadequate.

**The German War Office** has ordered that the fortress walls round Mainz are to be pulled down. The ground they occupy, some 465 acres, is to be given to the town.

**At the Last Meeting** of the Council of the Royal Society of Painter-Etchers and Engravers, Robert Spence and E. King Martyn were elected fellows of the Society.

**The Exhibition** of the Royal Society of Painters in Water-Colours will be opened on Monday, April 21.

**A Church Extension Society** has been formed at Great Grimsby. It is proposed to build five new churches—one for All Saints, one for St. Luke's, others for St. John's (New Clee) and St. Aidan's (Cleethorpes), and a mission church on Welholme Road. The sites have already been given.

**Mr. William Hayward**, of the firm of Messrs. Hayward Brothers & Eckstein, has left property valued at 32,287l. 4s.

**The Report** of the technical instruction committee of Eastbourne, recommending that the proposed technical institute should be erected at an estimated cost of 20,000l., came before the Town Council on Monday last. It was decided that the subject should be again discussed at a special meeting of the Council. The lowest tender received amounted to 34,000l. Mr. P. A. Robson has stated that he is prepared to obtain a builder's tender for 25,000l., to include all fees and buildings (the institute and the fire station), or for 20,000l., with a 10 per cent. margin for the institute.

**Messrs. Farrow & Jackson, Ltd.**, have been honoured with a warrant of appointment to His Royal Highness the Prince of Wales for the supply of cellar fittings, being the latest of a succession of similar appointments to His Majesty the King and to Her late Majesty Queen Victoria.

**The Grafton Galleries** will open early in May with an exhibition of works by M. Benjamin-Constant, and, in addition, the entire collection of portraits by the Marchioness of Grailly.

**Mr. F. W. Bond** has presented Truro Cathedral with a large relief by Mr. Tinworth, *The Way of the Cross*, which is modelled for Messrs. Doulton & Co.

**Mr. William J. Clutton**, of York, for many years agent for the late Lord Leconfield, who died on February 17 last, has bequeathed 1,000l. to the fund for the repair of York Minster.

**The Metropolitan Asylums Board** have approved and adopted plans for the erection of a home for female attendants at Darenth Asylum at an estimated cost of 9,500l., and also plans for the erection of cottages for married attendants at the Leavesden Asylum at an estimated cost of 5,210l.

**The Iron and Steel Institute** of Great Britain will hold their annual meeting in the hall of the Institution of Civil Engineers, Westminster, on May 7 and 8, under the presidency of Mr. William Whitwell. The special business of the meeting will include the presentation of the Bessemer gold medal for 1902 to Herr F. A. Krupp, of Essen, in recognition of the important services rendered by him in advancing the science and practice of the metallurgy of iron and steel.

**M. Jean Paul Laurens** will be represented in this year's Salon by his *Apotheosis of Colbert*, which is to be reproduced in the Gobelins manufactory for the Mairie of the thirteenth arrondissement. His second painting will represent Lamarie at the Hôtel de Ville on February 24, 1848.

**The Select Committee** that is about to be appointed to consider what measures can be adopted for improving the sanitation and ventilation of the Palace of Westminster will be constituted as follows:—Mr. Akers-Douglas, Mr. Dillon, Mr. Farquharson, Sir Walter Foster, Mr. Goddard, Mr. Penn and Sir John Tuke.

**The Westminster City Council** have let the contract for an Italian firm for the general scheme of decoration and illumination of the route of the Coronation procession for 5,990l.

**Abbé Girard**, professor at a college in the Gironde, read a paper, at the congress of learned societies last week in Paris, on the "Roman Wall in England." He contended that Adrian erected earthworks, while Severus erected the wall of masonry.

**The Remaining Works** of the late Sidney Cooper, R.S.A., will be sold at Christie's on Saturday, Monday and Tuesday next.

**The Dean and Chapter of Bristol Cathedral** have given the order for the restoration of the sedilia, sufficient funds having been received to justify their restoring them in part. A further sum of 300l. is still needed to complete the cost of the restoration.

**The Scientific and technical societies** in Manchester met a meeting under the presidency of Mr. Alfred Darbyshe have formed a committee to consider the question of obtaining a central meeting-place and to prepare a scheme or scheme.

**A Branch** of the French School of Archaeology in Athens has been opened. It is intended for the reception of students of other nations which have no separate institution.

**Mr. S. W. Kershaw, M.A.**, will read a paper at a meeting of the Society of Architects on the 24th inst. on "Ancient Hampshire Palaces." On the following day there will be a visit to the new cathedral, Westminster, and in the evening the annual dinner will be held.

**Mr. W. A. Richardson**, the water engineer at Birkenhead, died on the 3rd inst. in his seventy-ninth year. He formerly served under Mr. Newlands and Sir Robert Rawlinson.

**The "Surrey Magazine"** has commenced its fourth volume. It would be difficult to find a county publication which is equally localised, or one which gives so much interesting reading about past and present times, as well as illustrations, for twopence.

THE

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*The Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*The authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*\* As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS. OPEN.

**AUSTRALIA.**—May 1.—Designs are invited from sculptors for a memorial statue of Her late Majesty in marble or bronze. Information can be obtained at the office of the Agent-General for the State of Victoria, 15 Victoria Street, West-  
minster.

**HARROGATE.**—May 14.—Designs required for a new town hall. Premiums, 150*l.*, 100*l.* and 75*l.* Mr. F. Bagshaw, Borough engineer, Harrogate.

**IRELAND.**—April 21.—Designs are invited for twenty-five workmen's houses for the Coleraine Urban District Council. Premiums of 20*l.* and 10*l.* Mr. W. Henry, clerk to the Council.

**IRELAND.**—April 21.—Prizes of 20*l.* and 10*l.* respectively will be awarded for the first and second schemes in order of merit for utilising to the best advantage a plot of ground required by the Council for the erection of about twenty-five workmen's houses in Coleraine. Mr. William Henry, clerk, Town Hall, Coleraine.

**KNARESBOROUGH.**—June 1.—The Harrogate and Knaresborough Joint Isolation Hospital Committee invite competitive designs for an infectious disease (other than smallpox) hospital at Thistle Hill, Knaresborough. Premiums of 100*l.* and 50*l.* are offered for the two selected designs. Mr. J. Turner Taylor, clerk, Municipal Offices, Harrogate.

**LIVERPOOL.**—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

**MEXBOROUGH.**—May 1.—The committee of the Mexborough Montagu Hospital invite plans for the erection of an accident hospital for both sexes, for the treatment of thirty patients, with the needful nurses and servants' accommodation. Premiums of 25*l.* and 10*l.* are offered, the premium awarded to merge in the commission. Mr. C. Brumpton, secretary, Fern Villa, Mexborough, near Rotherham, Yorkshire.

**SCOTLAND.**—April 30.—Designs are invited for a branch library for the Anderston district, Glasgow. Sir J. D. Marwick, town clerk, Glasgow.

**SUNDERLAND.**—Aug. 30.—Designs are invited for proposed police and fire-brigade buildings to be erected in Gill Bridge Avenue and Dun Cow Street. Premiums of 100*l.*, 50*l.* and 25*l.* are offered for first, second and third designs respectively. Mr. Fras. M. Bowey, town clerk, Town Hall, Sunderland.

**YORK.**—May 1.—Designs are invited for a Memorial to the late Queen Victoria to be placed in the Guildhall, York. The design must include a representation of Her Majesty, and be accompanied by an estimate of the cost of the work complete, such cost not to exceed 1,000*l.* A prize of 50*l.* (to merge in the commission) will be given for the accepted design. Mr. W. H. Andrews, town clerk, Guildhall, York.

THE Scottish Association of Municipal Engineers and Surveyors held its inaugural meeting on Saturday, the 5th inst., in the Athenæum, Glasgow, and was attended by representatives from thirty-four burgh and other authorities in Scotland. The constitution, which had been prepared by a provisional committee, was submitted for approval and adopted without dissent. The meeting proceeded next to appoint the officials of the new association, and the city engineer of Glasgow, Mr. A. B. McDonald, was unanimously appointed the first president. The vice-presidents are Mr. A. J. Turnbull, Greenock, and Mr. Thos. Nisbet, master of works, Glasgow.

**SAFES, STRONG-ROOMS, PARTY-WALLS, DOORS.**

MANY attempts have been made to express the functions of government by comparison with a single object. It is no exaggeration to say that nothing is so well adapted for that purpose as an efficient safe. For what is the purpose of the most elaborate government? Is it more or less than the providing of security in many forms for all who come under its control? Armies and navies, courts of law, endless varieties of administration, what are they all but means of protection analogous to the steel enclosure which the prudent man obtains for his gold, securities and other wealth? Theorists may claim much for a "cheap defence of nations," but the world does not care for such safeguards, for even a philosopher like Diogenes would wish to have his tub, or rather his wine jar, preserved for his special use. One of the consequences of the relation to which we have alluded is that foreign manufacturers, who give more importance to expression than we do, endeavour to suggest that their safes resemble fortresses. There is a great array of bars, locks and protuberances, as if a siege were necessary before access could be gained to the interior. Love it used to be said laughed at locksmiths, and the modern scientific thief has a contempt for the structures which he knows are not obstacles to his skill, although they may give confidence to their owners.

In an age of shams there is nothing more illusory and more dangerous than the sham safe. Ignorant people cannot help confounding a thing that is called "safe" with security. They are attracted by external appearances, and they buy receptacles without inquiring who made them or where they came from. We are not exaggerating when we say there is an abundance of those metal cupboards which are little better if considered as protections than ordinary biscuit boxes of tin. They may long remain in houses, shops, or offices in which nothing occurs to test their powers of resistance, and it is, therefore, taken for granted that they are safeguards of property in which the fullest trust can be placed. If people would only reflect that in many cases safes from their weakness become a temptation to thieves, they would soon realise that one of the worst forms of extravagance is to invest money in buying safes for which there is no guarantee in the reputation of the makers. It is generally known that dealers in watches are able out of one genuine example by a known maker to produce two or three which are accepted by simpletons as valuable, and it cannot be concealed that name plates on imitations in thin metal are

employed for the purpose of beguiling unwary purchasers of safes and strong boxes. The cheap safe may, indeed, be described in Shakespeare's words as "the seeming truth which cunning times puts on to entrap the wisest."

Messrs. Hobbs, Hart & Co., Ltd., have issued a new catalogue which will be found especially useful to those who living at a distance are unable to visit the showrooms at Cheapside or the works at Islington. In the pages of the catalogue the principles of the business as well as its results are explained. There are, for example, five "qualities" or varieties of safes which have definite characteristics. The demand for them has been so extensive, Messrs. Hobbs, Hart & Co. are able to arrange classes corresponding to requirements and to keep to the order from day to day. As is universally known, each safe has its own body plates, and in consequence there are no joints which can be operated on. Backs, sides and door-jambes are bent out to a single plate varying in thickness according to the class. The doors have also their peculiarities, and the locks may either be "Protectors" or "Violence," or both combined, in the same safe. The "Protector" locks are recognised as a special feature which is unpickable, for an offer of 300 guineas with unlimited time to make the experiment has failed to secure an opening. The bolt mechanism is invulnerable against forcing wedge. The curved clutch bolts are also a specialty. All the features have been repeatedly tested in fires and by burglars and have come out unscathed from all attacks. In the case of a safe in a London church a charge of gunpowder was exploded in a hole drilled through the safe, but although it was injured an entrance was not accomplished.

The unconquerable efficiency of the safes is suggested when we find that Her late Majesty employed them for the custody of the gold and silver plate and jewels, and His Majesty the King also confides in them. They are used for the Bank of England, the London and Westminster Bank, the London and County Bank, the Birkbeck Bank, Messrs. Coutts & Co., Messrs. Cox & Co., Messrs. Child & Co., Messrs. Cunliffe Brooks & Co., Messrs. Drummonds, Messrs. N. M. Rothschild & Sons, and in fact most of the principal banks in London, in Scottish banks and Irish banks, and in several foreign and Colonial banks. It has been necessary to execute a special variety of sectional safes for use in places where, owing to the difficulties of transport, the parts have to be so packed as to enable them to be carried by mules or camels. There are also safes with vertical sliding doors to be introduced in banks and offices where there is not sufficient floor space to allow the

**WILSON'S PATENT "MULTILUX" WINDOWS**

The above illustrates an office where the light coming from the sky falls on to the floor and is absorbed, thus leaving the back part of the room dark. The illustration below shows the same room with WILSON'S PATENT MULTILUX WINDOW fixed. This refracts the rays of light and throws them horizontally, thus preventing them falling on to the floor, and lighting up the whole room.

nary doors to open. "Safe deposits" are suggestive of dense buildings. They are furnished on the largest scale Messrs. Hobbs & Co., but there is also a patent "safe deposit" of smaller dimensions which contains thirty or more safes, and which can be let by bankers to their clients. This is an admirable arrangement, which must be of immense advantage to many of the public. The precaution is to have two distinct lockings, and a third can also be added. The safe deposit "integers" are fitted with a tinment box, so that the contents can be taken as a whole to the writing-room or elsewhere. The strong-room doors are manufactured of several kinds. The company also produce gates and frames which allow of ventilation. Another liability to safety is a steel vestibule lining so that the door frame cannot be removed by violence. It is hard to see what force possessed by individuals could overcome the bankers' strong-room doors which are prepared for extreme risks. Attention should also be made of emergency or manhole doors, which are intended to provide a ready means of access to the strong-room in the event of its keys by any mishap being lost or damaged. One illustration shows a special strong-room which would afford adequate security against the attack of burglars. It is fitted with a steel lining throughout, with the strong-room door, takes the form of a self-contained safe of the size and shape of the brick rooms. As it is usually placed in the basement, over the top are steel joists of cement concrete, the sides are of blue Staffordshire bricks, and beneath is a bed of cement concrete with a steel grille. Ventilation has not been neglected, for a patent double-coned ventilator can be fixed inside the strong-room. There are also elevated lintels and tubular adjustable shelving. The company also make party-wall doors or shields to meet the requirements of the Building Acts in town and country. The sliding

doors are so fitted with clutches as to prevent the doors being pushed back by falling girders or columns; at the same time there is no danger of cutting off the escape of persons who might be engaged in another portion of the building.

The works of the company are at the side of the canal in Arlington Street, Islington. In them organisation prevails, and the heaviest safe or an ornamental jewel casket for a lady can be accomplished with readiness. In the works not only the requirements of banks, jewel merchants, solicitors and other people throughout the world are realised, but architects' specifications can be carried out to any extent. With such a business plant and machinery on a large scale and of the most expensive varieties must be available, and the company therefore may be regarded as steel workers who have to be occupied in preparing forms which must attain their end as much by their perfection as by their strength. The delicacy which has to be found in locks made up of a multiplicity of parts is also demanded in the fitting of the hinges, bolts, clutches and other parts of the mechanism of safes and strong doors, for they must be mathematically accurate in all their parts. The spectacles presented in the different parts of the works are therefore diverse. We have burly vulcans whose exertions recall the poet's lines:—

The roof-ribs swarth, the candent hearth, the ruddy lurid row  
Of smiths that stand, an ardent band, like men before the foe.  
"Hurrah!" the jetted lightnings are hissing high and low,  
A hailing fount of fire is struck at every squashing blow,  
The leathern mail rebounds the hail, the rattling cinders strow  
The ground around: at every bound the sweltering fountains flow,  
And thick and loud the swinking crowd at every stroke pant, "Ho!"

Men no less vigorous have to operate on the massive plates in their cold state, and the process is followed until it is completed by fitters, under whose hands the mighty doors revolve easily on their hinges. The works not only typify that security which has made England what it is, and through which people in all lands entrust their dearest possessions to the guardianship of this country, and which enables philanthropists like the late Cecil Rhodes to confide their millions to English hands, knowing that their wishes will be carried out to the letter centuries after the donors have passed away, but the works likewise aid in affording that security, for in them are constructed the strong-rooms which thieves cannot break through, and to which documents of the highest importance are entrusted without any misgiving of their safety.

## A RHODESIAN BRICK AND TILE MAKING FACTORY.

As in all new countries the production of bricks is almost as much an elemental necessity as the procuring of foodstuffs. The cost of importing such weighty articles into the up-country districts being practically prohibitive if buildings are to be constructed of something stronger than wood, bricks must be made, or the buildings constructed of stone. To construct them of bricks is unquestionably the more economical, hence the growth of the brickmaking industry in all the inland districts of South Africa. Messrs Taylor, Jarvis & Short, of Salisbury, Rhodesia, have now launched into the enterprise of brick and tile making, and recently took delivery of some 55 tons of brick and tile making machinery, supplied some three years ago by Messrs Robey & Co, Ltd, and Messrs. J. Whitehead & Co, Ltd, and lying for the past two and a half years at Beira. As testimony to the expert packing which English firms of repute adopt, despite its long sojourn on the coast, the plant when unpacked was found to be in as good condition as when it left the makers' workshops.

The very complete plant comprises a 20 horse-power compound Robey engine; a loco-pattern boiler, with extended fire-box for wood fuel; a Whitehead "Eureka" brickmaking machine, turning out 20,000 bricks per day. It is equipped with the Bennet & Sayer patent iron dies, and performs the three processes of grinding, pugging and moulding. There are also a tile and pipe machine, making pipes from 3 inches to 12 inches diameter, and tiles up to 14 inches square, of any pattern; a power mortar pan, with steel-faced rollers; a saw-bench, a narrow-gauge tramway with twelve trucks, worked by an endless steel cable, &c. Dick's 7-ply patent belting is used for the gearing. As previously pointed out in cases elsewhere, there is undoubtedly money in such a venture, and this is particularly the case at Buluwayo and in adjacent districts, where the initial demands for civil and industrial purposes is especially extensive, according to the *British & South African Export Gazette*.

A 20 horse-power compound engine from the works of Messrs. Robey & Co., Ltd., has been installed at the new brick and tile making works of Messrs. Taylor, Jarvis & Short, Salisbury, Rhodesia.

The new engine equipment of the Buluwayo Electric Lighting Works was supplied by Messrs Robey & Co., Ltd

## NEW CATALOGUES.

A USEFUL pamphlet just being sent out by Messrs. Mather & Platt, of Salford Ironworks, Manchester, is devoted to a detailed description of their new patent high-power centrifugal pump, which is an improved patented type of circulating pump, in which the water enters the revolving wheel axially, and, in the case of single pumps, symmetrically on each side of the wheel, so that axial thrust is eliminated; the water then traverses the curved internal passages between the vanes, and is discharged tangentially at the periphery into a stationary guide ring of special construction, this conveying it to the annular chamber in the body of the pump, where the velocity head imparted to the water by the wheel is converted into pressure head. From this chamber the water is finally discharged into the pipe lines, or, if the pump be a multiple one, into the second and subsequent chambers. A special feature of this pump is the provision of the stationary guide ring mentioned above; this is fixed concentric with the revolving vanes, and it is claimed that, owing to its design, it enables the conversion of velocity into pressure head to be carried out in a much more perfect manner than is possible in the case of any other centrifugal pump; thus not only is the possible height of lift very greatly increased, but also the efficiency of the pump is materially improved. Another point of interest is that in no part of these pumps is the water forced to undergo a sudden change of direction, or to meet with a sudden difference of cross section in the passages. The whole internal design is carried out in suitable curves and channels of gradually increasing area, so that the liquid dealt with is never restricted or opposed in its course through the pump. It may at once be conceded that there is a wide field for these pumps in all classes of hydraulic work. Their chief features compared with the reciprocating pump are silent running and absence of wear and tear.

AN eminently practical and businesslike catalogue of sixty-four 4to illustrated pages, descriptive of their carefully and artistically designed and highly-finished brasswork for public and private buildings emanates from the old-established firm of Tonks, Ltd, Birmingham. These comprise, as it is hardly necessary to state, every possible description of plain and ornamental door and window furniture, casement stays and fasteners, and espagnolette bolts, numerous kinds of hooks for cloakrooms, restaurants, &c, polished brass counter railings, church furniture, self-fitting stair treads and nosings, lightning conductors, &c. The illustrations throughout give ample

f, were such evidence necessary, that the firm have at their  
mand a staff of designers whose abilities are equal to any  
ble demands which could be made on them, each article  
ing the true artistic feeling as well as the high finish on  
h Messrs. Tonks have based and still maintain their high  
eration.

ESSRS. JAMES ALLAN, SEN., & SON, of Elmbank  
dry, Glasgow, in issuing their new catalogue have  
ted a practical method in bringing it out in sections, each  
hich is of handy size, is neatly bound and fully illustrated.  
f these books is devoted to each of the following sec-  
:-Baths, lavatories and bath-room fittings and acces-  
s, Stable, cowhouse and piggery fittings, Stairs, balus-  
s, &c., Verandahs, bandstands and shelters, Rain-water  
oil goods and Railings, gates, terminals, &c.

HE Leicester Laundry Engineering Company, Great  
al Street, Leicester, have prepared their new catalogue  
ndry machinery, in which are illustrated all their various  
ines for washing, drying, starching, ironing, &c., as well  
e engines used in operating them.

TRADE NOTES.

IRS. ARCHIBALD SMITH & STEVENS ask us to state  
the fire which recently occurred at their premises, Janus  
cs, Queen's Road, Battersea, was really only a very slight  
e, indeed, and never affected any portion of the building.  
ally occurred on some waste ground at the back, and of  
e in no wise affects the firm's ability to execute all orders  
sted to them with their customary despatch.

HE second temporary hospital for the Corporation of South-  
or is being warmed and ventilated by means of Shorlands'  
at double-fronted Manchester stoves by Messrs. E. H.  
and & Brother, of Manchester.

HE ventilation of the new Memorial Cottage Hospital,  
ndrews, now in course of erection, is being carried out by  
es of Mackay's patent direct-acting ventilators, supplied by  
es. Cousland & Mackay, ventilating engineers, Glasgow  
d Manchester, the sole makers.

NEW memorial tower erected at Saltburn-by-the-Sea  
church, Yorks, to the Rev. B. Irvin, M.A., vicar of  
arn, and a new clock and chimes to the memory of the

late Queen Victoria, were dedicated on Saturday last by the  
Archbishop of York, the architects being Messrs. Clark &  
Moscrop, of Darlington, the makers of the clock and chimes  
being Messrs. Wm. Potts & Sons, clock manufacturers,  
Guildford Street, Leeds, and the builder of the tower being  
Mr. R. Harland, Whitby.

APROPOS of the restoration of the spire of St. Bride's  
Church, to which we have more than once referred, Mr.  
Fishburn, of High Wycombe, Bucks, whose patent winch is  
employed on the job, has received the following gratifying  
letter from Messrs. John Thompson & Co., the contractors :-  
Sir,—We have pleasure in stating that we have used one of  
your new patent crabs for hoisting scaffolding, &c., to the spire  
of St. Bride's Church, Fleet Street, and have found it a most  
useful tool, effecting a continual saving of time and labour as  
compared with the old-fashioned crab.—Yours faithfully,  
(Signed) JOHN THOMPSON & Co.

Mr. Joseph Fishburn.  
While a winch supplied for the works in connection with the  
Co-operative Stores at York has elicited the subjoined not less  
satisfactory testimonial:—

April 4, 1902.  
Sir,—I beg to acknowledge the receipt of your letter  
acknowledging payment for the two winches you have fixed to  
the Stores at York for the Co-operative Society, and I am very  
pleased to bear testimony to the excellency of the materials  
and the splendid work done by the winch, the work accom-  
plished by it being eminently satisfactory and proving a  
great saving in labour; and I feel sure that there is a great  
future before it.—Yours faithfully,  
(Signed) H. BECK (Athron & Beck).  
Mr. J. Fishburn, High Wycombe, Bucks.

It appears from a report submitted by the works committee  
of the Shoreditch Borough Council that an official in the  
surveyor's department has for some years past engaged in  
drawing plans for private persons in connection with sewerage  
and drainage works undertaken by the Council. This was  
thought by the committee to be a doubtful proceeding on the  
part of the borough surveyor's department, and the Council  
have endorsed the view of the committee and resolved that the  
practice be discontinued.

## VARIETIES.

THE Queen has forwarded 10% towards the restoration of Wymondham parish church, in Norfolk.

A NEW Congregational church, Gothic in design, which has been erected at a cost of 3,000%, was opened at Waring Green, Brighouse, on Saturday last.

MR. J. J. HENDERSON, J.P., architect, died at his residence in Tayport on Monday morning. Mr. Henderson was well known in architectural circles in Dundee, acting as hon. secretary of the Dundee Institute of Architecture.

THE New Moston Board school, built by the Manchester School Board at a cost of some 10,000%, was opened on Monday last. It is built for 400 children on an enclosure of a couple of acres.

THE foundation-stone of the new building of the Institute of Journalists in Tudor Street and Bridewell Place will be laid by Sir Edward Lawson, one of the early past-presidents of the Institute, to-morrow, April 12.

TWO memorial windows have been placed in the west end of the Royal Chapel, Windsor Great Park, by the residents in the royal demesne, to the memory of Major Prince Christian Victor, who died in South Africa during the present war. The windows represent the figures of St. Michael and St. George.

THE Twickenham District Council have adopted, by eleven votes to nine, a resolution proposed by Dr. Martindale Ward, of the Richmond Hill View Protection executive committee, that Twickenham's contribution to the purchase of Marble Hill should be increased from 3,000% to 6,000%.

A MOVEMENT is on foot for extending the town hall of Sheffield, which was opened a few years ago by Queen Victoria. The development of the tramways undertaking and the general growth of the work of the Corporation have rendered this course so necessary that the finance committee have requested the improvement committee to take the matter in hand.

A NEW Baptist chapel was opened at Walsgrave-on-Sowe on the 1st inst. It has been erected at a cost of 1,300%, is in the Italian style of architecture, and is entered by a flight of steps and through a vestibule. The size of the building is 43 feet by 28. There is a gallery at one end, a minister's vestry, a classroom and all necessary conveniences. Seats are provided for 200 persons.

MEMORIAL-STONES of a new Wesleyan Methodist school, which is being built in the village of Astley, Lancs, have been laid. The total cost of the scheme of extension which has been decided upon, and which includes the erection of a new chapel, will be about 4,000%. The work is being carried out by Mr. James Cocker, of Walkden.

WHILE pulling-down the old vestry and other building behind the Wesleyan chapel at Barton-on-Humber to make room for extensions the workmen have made a curious discovery. Built into the wall close to the ground they came across a rat which fifty years ago, when the premises were erected, must have strayed there. It was completely petrified, doubtless owing to the action of the lime from the mortar, and is almost as hard as a stone.

THE Ecclesiastical Commissioners are the owners of Caff Street, Mitre Street and Ufford Street, between the New Canal and Webber Street, and the leases of the houses have fallen in. The Commissioners have decided to erect two and three storey buildings instead of the so-called "model" blocks of dwelling and the rents of the cottages and flats will, it is said, average from half a crown to three shillings. The cost of clearing the old area, erecting the new buildings and making the new streets is estimated at between 75,000% and 80,000%, and the scheme will take a couple of years to carry out.

THE Great Eastern Railway Company's new station at Newmarket, which is situated on the Cambridge side of the old station, and about a quarter of a mile nearer the racecourse, was opened on the 7th inst. Long platforms have been constructed, the up and down platforms being connected by means of a subway. Excellent waiting accommodation has been provided, and spacious refreshment-rooms will be found both the up and down platforms, especially designed to provide for the requirements of the race traffic. The whole of the station buildings, platforms and roadways are lighted by electricity. The approaches to the station on both sides are of very spacious character. Colonel McCalmont, M.P., has constructed new roads, which afford good facilities for reaching the new station both to and from the town and racecourse, as well as from the direction of Cheveley.

A NEW infants' school was opened at Firbright, Surrey, on the 2nd inst. Accommodation for 120 children is provided in the building, which can be divided into two rooms—one 30 feet by 20 feet, and the other 20 feet square—by a patent folding glazed partition. A schoolroom for eighty children and class

Specially and scientifically designed to prevent and mitigate the evils of Smoky Chimneys.

for forty are thus formed, and the partition, whilst preventing the noise of the junior class from interfering with the other children, permits of the head teacher exercising complete supervision over the whole school. The building is well lighted and ventilated, and is warmed by open fires, which also supply a continuous current of warm air to the rooms. The floor is of wood blocks laid on concrete. The walls have a boarded dado, stained and varnished, 4 feet and above this are of best red brickwork, neatly pointed. The fireplace in the larger room is a carved stone tablet, on which is an inscription recording the fact that the land was presented to the school by the names of the members of the school board. Attached to the school are lavatories, cloak-rooms and caretaker's cupboard, and playground are the usual offices and a playshed. The site has been levelled and gravelled, and the site is enclosed by a stout fence. The designs were by Messrs. Welman & Co., architects, of Guildford.

The fourth annual general meeting of the Edinburgh Association of Ordained Surveyors was held on the 4th inst. at the rooms, 117 George Street, Edinburgh, Mr. A. Lawrie, in the chair. The Council, in submitting its third annual report, congratulated the members on the flourishing condition of the society. No alteration had taken place in the membership during the past session. At a general meeting of the society a committee was appointed to take steps towards the formation of a Students' Society. The society now shared the Edinburgh Architectural Association the rooms at George Street by an arrangement with the latter body. The funds of the society at the close of the financial year ended on 24th inst. 7d. The general examining board, in its report for the session, stated that in the forthcoming preliminary examination this month four candidates had come forward for examination and one for re-examination. Five candidates had come forward for the forthcoming final examination. The reports, on the motion of the Chairman, were adopted. It was agreed, after a vote, that the annual report of the society remain as at present, namely, 2s. 6d. The previous question was moved by Mr. Lightbody, secretary, who pointed out that the society would in the future have to face a heavier expenditure than hitherto. It was agreed that a contribution of 9s. 6d. be made to the examining board to remunerate the examiners in the final examinations held in April and October of last year. Mr. Smith was elected president for the ensuing year, and

thereupon took the chair, Mr. Fairbairn being elected vice-president, Mr. Lightbody secretary, and Mr. Johnston treasurer.

IN the United States about 620,000,000 cross ties are now laid on American railroads and 90,000,000 new ties are required annually for renewals. The amount of timber used every year for ties alone is equivalent to 3,000,000,000 feet of lumber. There are now standing nearly 7,500,000 telegraph poles. The average life of a telegraph pole is about ten years, so that nearly 750,000 new poles are required every year for renewals. These figures do not include telephone poles and the poles required on new railway lines. The total annual consumption of timber for ties and poles is equivalent to the amount of timber grown on 100,000 acres of good virgin forest. For making shoe pegs the amount of wood used in a single year is equal to the product of fully 3,500 acres of good second growth hardwood land. Four million feet of pine timber is used every year for matches, or the equivalent of the product of 400 acres of good virgin forest. Lasts and boot trees require at least 500,000 cords more. Most newspaper and packing paper is made from wood. Although this industry has been developed only within the last forty years, yet the amount of wood consumed for paper during that time has been enormous. The total annual consumption of wood for paper pulp is equivalent to over 800,000,000 board feet of timber, for which it would be necessary, were the trees all growing together, to cut some 80,000 acres of prime woods. And so it would be possible to go through the list and give figures which in every case are astonishing. About 40,000,000,000 feet of lumber a year are now being used in the States for the lumber and paper trades, and this is equivalent to the product of about 4,000,000 acres of good virgin forest, an area equal to Rhode Island and Connecticut combined; and yet this does not include the wood used for fuel, which is four and one-half times more.

## BUILDING AND BUILDERS.

THE eastern district committee of the Dunbar County Council have accepted the plans of Messrs. Sydney Mitchell & Wilson for the erection of a new hospital for the district at a cost of 5,600l.

THE town clerk of Walsall (Mr. J. R. Cooper) has received an intimation from the private secretary of Prince Christian

fixing May 29 as the date of His Royal Highness's visit to the town to lay the foundation-stone of the new municipal buildings. The arrangements for the reception and subsequent ceremony will be carried out by a sub-committee appointed by the Town Council and presided over by the mayor (Councillor W. J. Pearman-Smith).

THE Conseil Général of the Seine has voted an important credit for the purpose of forming an avenue in prolongation of the Avenue de la Grande Armée, which will extend in a direct line of nearly thirteen miles from the Place de la Concorde, past the Monument de la Défense, as far as the centre of the Forest of St. Germain. The town of Nanterre has offered to abandon to the State the ground necessary for the formation of the principal portion of this fine avenue. The avenue will be 130 feet wide, planted with rows of trees, and will comprise a line of electric tramways, a carriage road and a cycling track.

### ELECTRIC NOTES.

ELECTRICITY is to be used in lighting the additional cells about to be built in the naval goal at Lewes.

AN English syndicate is seeking a concession for the construction of an electric railway between Brussels and Antwerp.

BRIDLINGTON Town Council have decided to engage a consulting electrical engineer to advise the Council as to the carrying out of the electric-lighting order of 1900.

AT a special meeting of the Middlesbrough Corporation electric-lighting committee held on the 2nd inst., Mr. H. M. Taylor, of the British Westinghouse Company, London, was elected electrical engineer to the Corporation at a commencing salary of 250*l.* per annum.

THE present asylum for Dorset having become inconveniently crowded, it is proposed to transfer the private patients at present accommodated there to a new building to be erected at Herrison at an estimated cost of 45,000*l.*, application to borrow which sum was made to Mr. E. A. S. Fawcett, Local Government inspector, no objection being raised.

A MEETING of the Manchester section of the Institution of Electrical Engineers was held on the 8th inst. in the New Physical Laboratory at Owens College, Manchester. Mr. A. R. Bellamy delivered an address on "Large Gas Engines for Driving Electric Generators." So many grave charges, he said, had been brought against the gas-engine that, if there

were no extenuating circumstances, the verdict would undoubtedly be banishment for life. The merits of the gas-engine were becoming better known and acknowledged every day. It might be said that English manufacturers were behind those in other countries in this respect. The manufacture of gas-engines was, comparatively speaking, a new industry, and electrical engineers would appreciate the fact that it took time to make developments. There were now, however, several makers of gas-engines producing units of 500 horse-power, and it might be said that even the 500 horse-power unit was faultless when compared with steam-engines. That might be true, but it should not be forgotten that when the gas-engine first claimed their attention about twenty years ago, it was little better than a toy, and the progress that had been made in the meantime augured well for the future. On the credit side of the gas-engine account, undoubtedly the first and most important advantage was economy in working. Gas-engines working with town gas could produce electric current at a cheaper rate than it was usually supplied even for motive-power purposes.

A SPECIAL meeting of Hamilton (N.B.) Town Council was held on the 2nd inst., to consider the reported action of the electric-lighting committee in selecting a site for the generating station, and asking that the resolution conferring on them full powers in the matter be rescinded. Provost Pitt presided. From the report of the committee it appeared that they had had before them three sites at Burnbank, belonging to Messrs. Frame, ironfounders, Beckford Street, belonging to the Hamilton Building Society, and Orchardhill, the property of Treasurer Kemp; that the committee had decided on the site in the Orchardhill district, although the engineers of the company who are to work the electric system and the burgh's consulting engineer favoured the Beckford Street site. It appeared also that a portion of the committee had after the meeting gone to the town clerk's office and had an agreement drawn up accepting Treasurer Kemp's offer in regard to Orchardhill. After the report had been read Mr. Meehan, convener of the committee, complained that this arrangement had been come to behind his back. In a long discussion, which at times was heated, the connection of Treasurer Kemp as proprietor of the Orchardhill site, and the provost as a shareholder in the building society who own the Beckford Street site, was animadverted upon. Ultimately a motion by Mr. MacHale rescinding the resolution conferring powers on the committee and leaving the whole question of the site open was carried by 8 to 5.

# HOUSING PROBLEM IN LIVERPOOL.

United States Consul in Liverpool having sought information to housing of the poorer classes in that city has the following reply from the chairman of the housing committee of the Liverpool Corporation :—

Liverpool : April 3, 1902.

Mr. Boyle,—Referring to my letter of March 24, I have the pleasure in answering, as far as possible, the various questions put by you in your letter, dated March 10, on the subject of the housing question as it affects Liverpool. In the reply, I take the opportunity of enclosing the last annual report to dwellings, and will forward you a copy of the same which has been brought up to date. I also send you certain reports which will, I think, be useful to you. Your questions will answer in the order in which they are submitted.

It is true that Liverpool and Birmingham are the two worst cities in England, as is stated by some authorities? To this, I can only say that in my judgment Liverpool is the worst slum city in England. I understand from reports that have visited Liverpool, officially and otherwise, in connection with insanitary property, that there exist elsewhere as bad as any we have in this city.

As to the area of the slum insanitary district in Liverpool? It is difficult accurately to define the area of the insanitary district in Liverpool. There is, however, at the end of the city a district comprising about 383 acres, in which houses structurally insanitary are found in large numbers.

Many of these have, however, been already demolished, and others are in process of demolition. At the other end of the city there is a similar area of about 100 acres, in which the same remarks apply. These two areas contain the bulk of structurally insanitary houses. There are, however, other districts in the city where houses not structurally insanitary have been made insanitary by reason of overcrowding and the habits of the people.

As to how many insanitary houses there are in Liverpool, and the number of such houses demolished since the commencement of the operations? The original number of structurally insanitary houses at the time when the Corporation commenced operations is estimated to have been 22,000. Since that time, the Corporation have demolished say 8,000, and the causes, such as the necessities of trade, private enterprise, &c., have accounted for the demolition of 4,000

houses. This leaves a balance approximately of 10,000 still to be dealt with by the Corporation or by other agencies.

4. The number of people residing in structurally insanitary houses? The average is over five persons per house. Slum houses in Liverpool are generally of three rooms, although as a rule the third or upper room is very seldom used. 5. See No. 3.

6. Do the owners receive compensation? In reply to this question I may say that the Corporation of Liverpool have largely exercised the powers conferred upon them by the Liverpool Sanitary Amendment Act, 1864. Under this Act compensation is paid to owners of insanitary property which is demolished, such property being condemned on a "presentment" of the grand jury at quarter sessions upon a report of the medical officer of health that such property is insanitary and unfit for human habitation. The Corporation are also using the powers conferred upon them by Part I of the Housing of the Working Classes Act, 1890, which deals with unhealthy areas as a whole, and under this part of the Act owners of insanitary property receive compensation. Under Part 2, however, of the same Act there can be issued a closing order against any house which is in a state so dangerous or injurious to health as to be unfit for human habitation. If on receipt of the closing order the owner makes the house fit for human habitation nothing more is done, but should there be default on his part an order for demolition may issue without any claim to compensation, in case the premises are a danger to the health of the neighbourhood.

7. Does the committee recognise any legal obligation to pay compensation? I have stated above the legal powers under which the Corporation can operate, and under both the Acts to which reference has been made some compensation is in certain cases contemplated. At the same time, in assessing the amount of such compensation due regard is had to the condition of the property. I may also mention that under the local Act an owner of insanitary property has the option of retaining the site, and in this case the Corporation itself may either demolish the property (the price obtained for the old materials being a set-off) or arrange with the owner to do so himself, the Corporation paying a certain compensation in either case.

8. When the city pulls down insanitary property does the municipality become the owner? Under the local Act of 1864, in cases where the owner does not elect to retain the site the Corporation must of necessity acquire both land and buildings,

and the same holds good under Part I of the Housing of the Working Classes Act, 1890.

9. What is done with the spaces left when the insanitary property is demolished? In some cases the land is sold by the Corporation to private individuals, subject to certain restrictions as to the kind of building to be erected, the object of which is to secure improved sanitary conditions. At least 700 houses have been erected on land so sold. In other cases the Corporation themselves have built and are building blocks of dwellings on vacant sites; 895 tenements have been erected and 1,301 tenements are in course of building or contemplated. Where, under the powers of the local Act, the owner retains the site, no buildings can subsequently be erected except with the approval of the Corporation.

As regards questions 10, 11 and 12, both the Local Government Board and the Corporation of Liverpool recognise the necessity of building houses to meet the wants of dispossessed tenants. The Local Government Board insist upon certain provision in this respect before they sanction demolition operations. In this connection it is of interest to mention that in October 1899, after a lengthy correspondence with the Local Government Board, the Corporation by resolution undertook to provide for the needs of 3,056 dispossessed persons, this number being inclusive of those persons dispossessed from houses included in the sixteenth presentment, which was made on December 19, 1899. It could not be said until recently that the Corporation had houses ready in advance to supply the wants of the dispossessed tenants, but in former years there have been large numbers of vacant (private) houses available for this purpose. The present policy is undoubtedly to have blocks of dwellings ready within convenient distance into which dispossessed tenants can go.

Alone among the municipalities of England and Scotland, Liverpool has successfully attempted to supply a type of dwelling at such a rent as those dispossessed from insanitary houses, who are the poorest of the poor, can afford to pay. The success of the Corporation in this direction is undoubted, and has recently excited the admiration of representatives of other corporations and other officials, who have candidly admitted that Liverpool in this respect stands on an altogether different footing to any other municipal authority.

13. How many municipal houses have been constructed since the municipality started on this undertaking? The total number of dwellings erected and in contemplation will be seen from the print enclosed herewith, in which the rents of the

available dwellings are also given. None of the tenants is in a position to become owners of a municipal tenement.

14. What has been up to date the total cost to the municipality of private houses, and what amount has been paid to the owners of condemned insanitary property? As to the cost of erecting the buildings has been 146,575 amount paid in respect of the demolition of insanitary property amounts to over 385,000, in addition to which the Nas scheme, which resulted in the erection of Victoria Square Juvenal Dwellings, &c., cost for land alone 67,165, the buildings being included above.

The total burden thrown on the rates as the result of combined operations amounts to only 13d. in the pound, an extremely reasonable charge in view of the great work accomplished.—I am, my dear sir, yours faithfully,

AUSTIN TAYLOR  
The Hon. James Boyle, United States Consul.

## THE GLASGOW STAND CATASTROPHE.

THE collapse of the stand at Ibrox Park, Glasgow, Saturday, was a calamity almost without precedent. *Glasgow Herald* says:—

Greater Ibrox, as the new ground is termed, was according to plans prepared by Mr. Archibald Leitch, consulting engineer, of Glasgow, who is engaged on the grounds for the Sheffield United Cricket and Football Club, Ltd., and the Derby County Football Club, Ltd. A sum of about 20,000l. has been expended in equipping the enclosure which is regarded as one of the most complete of its kind. The playing pitch is encircled by a quarter-mile cinder track for pedestrianism and cycling, the pitch and the track being surrounded by a strong barrier of wood surmounted by iron railings. Accommodation is provided for about 84,000 persons, all of whom, according to the arrangement followed here, claimed, an uninterrupted view of the field of play. The grand stand and pavilion are on the south faced on the north by covered terracing, while to the east and west are open circular terracing or stands, the latter rising to about 10 ft. and the former to about half that number. The whole of the terracing is erected on the same principle, namely, columns resting on a base of concrete, and steel beams

inally. The steel beams carry wood raking beams or the top of which the treads forming the terraces are these are about 14 inches broad, with a rise of 4½ inches. ing beams are of red pine, 12 feet long, 8 inches deep ches broad. Behind the topmost tier is a fence com- corrugated iron sheets. Admission to the terracing is by stairways of varying width. In the case of the portion there are nine of these gangways, which are from all the public entrances.

west-end terracing in Ibrox Park, as seen in the quiet- Sunday afternoon, bore eloquent testimony to the scene of the previous day. That portion which l measures about 80 feet along the terracing close to r edge, and has a breadth inward of 13 feet. The extends across six of the spaces between the large iron pillars, along the tops of which steel or iron re strung all round the field. These are about 13 feet d they are arranged in rows 13 feet separate from the o the inside of the terracing. Although metal girders g them round the field, each row is connected with the the ordinary wooden beams, which support the ti or "treads" on which the spectators stand. These oring beams—some of which collapsed on Saturday and ie disaster—stretch across the sloping space from one al girder to another, a distance of 13 feet, themselves ted except by a stay from the corrugated iron railing a point 2 or 3 feet down the terracing. The beams 8 inches by 3 inches, and the planking on which the s stand 6 inches by two. When the 80 feet by 13 feet lapsed it is evident, looking at the wreckage, that the eams must all have broken about the middle. The illing on the stays attached to the corrugated iron ove pulled the railing inward to an angle of about and the woodwork, along with all those on it, must pped down among the diagonal stays erected under- the purpose of stiffening the structure. Only the nds of the supporting beams now remain in their e middles lying around in matchwood below. Many ces are covered with blood, and along with shoes are e hats and bits of gory paper and bandages, showing w awful must have been the scene immediately after lent. Right in the centre of the ground below the hich collapsed there is a corrugated iron railing run- right angles to the field, and across this some of the must have fallen. In the smashed woodwork above,

where several beams crossed, there can be seen a boot jammed between two splinters, and hanging mouth downward. The wearer had obviously been caught and held by the foot until his foot slipped out of the boot and he fell to the ground.

From the inside the scene is equally eloquent. All the stout iron rods which were erected here and there over the terracing in order to prevent the crowds from swaying to and fro are levelled, the supporting standards being broken at the planking or torn up. These are about 22 inches in diameter, of cast-iron, and were heavily bolted to the woodwork. The fact that they were totally insufficient to control the surging of the excited crowd shows the terrible pressure that must have been on them. The people nearest, in fact, must have been pretty nearly killed by being jammed hard against these railings. The slighter railing, again, which divides the terracing from the cinder track is bent flat for a distance about equal to the length of the collapsed woodwork far behind, showing how the crush must have acted all the way downward, carrying before it all the dividing railings, flattening the final lighter railing, and surging out on to the playing pitch.

### SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on Monday evening, April 7, Mr. Percy Griffith, president, in the chair, a paper was read on "Australian Timber Bridges and the Woods used in their Construction," by Mr. Herbert E. Bellamy, city engineer, Rockhampton, Queensland.

The author, at the outset, pointed out that bridges built entirely of timber were now seldom erected in England, but that in the colonies timber bridges were very extensively constructed. He then proceeded to discuss the life of such bridges, which, he said, was very varied, but might be put at from thirty-five to fifty-five years, according to location and other circumstances. He then proceeded to describe a timber bridge which he had recently designed and erected in Queensland. This bridge is 320 feet long and 18 feet 6 inches wide. It spans a creek 10 feet deep at high water, and which also has 20 feet of black mud below the bed. In flood times the waters rise 25 feet above the level of ordinary high-water mark. The piles, which are of ironbark timber, well creosoted, were dealt with in detail, the sizes, lengths, methods of scarfing, driving,

tests and covering with Muntz's metal being given. The cost of driving the piles complete, including materials, labour, plant, &c., was given as 4s 6d per lineal foot. The decking and its members are of spotted gum, and the cost was stated to be 99s. per square, including all material and labour. The total weight of all the timber in the bridge as fixed is about 200 tons, whilst the weight of the ironwork fixed is 4½ tons. The total cost of the structure, including a small portion of the approach roadway, was 1,900l.

The author then described the different varieties of Australian timbers—seventeen in number—mostly used in bridge building and for other constructive purposes, specimens of all of which were exhibited. The author referred to the distribution in the colonies and the qualities, &c., of the principal trees. The strengths and sizes of the leading timbers were also given. Of different kinds of timber suitable for bridges, ironbark, spotted gum, blue gum, bloodwood, blackbutt, box, mahogany, karri and swamp mahogany were stated to be amongst the most durable. Ironbark, mahogany, blue gum, bloodwood, swamp mahogany, turpentine or peppermint, tea, she pine and cyprus pine are very durable when constantly immersed in water or in wet ground, and are therefore well adapted for piles, &c., for the foundations. Karri, which is a member of the eucalyptus family, is largely used for street paving. The author expressed the opinion that the good qualities of Australian timbers were not fully realised, otherwise they would be more extensively used both in Europe and America.

The author next described in detail the appearance of good timber, the chief qualification being slowness of growth as shown by the narrowness of the annual rings. He then elaborated the various methods of seasoning, which consist either in evaporating the sap by air-drying, or in dissolving it in water and afterwards sun-drying the timber. Artificial drying is rarely resorted to with timber for engineering purposes. The author then passed on to a consideration of the general causes of decay and the destruction of timber by worms and insects. The destructive methods adopted by the white ant and the *teredo navalis* for invading timber were explained, and the means employed for its protection against these pests were pointed out. It was stated that copper-sheathing was not permanently effectual in resisting the attacks of the *teredo*, but that creosoting, properly carried out, was the most successful of any process yet known. The preservation of timber was then considered, and the author dealt with painting, charring,

creosoting and impregnation with metallic salts. The method, however, has not in all cases given satisfactory results.

The paper was listened to by an appreciative audience, and at its close a cordial vote of thanks was given to the author.

### EXPENSES OF PAVING.

ON Monday at the North London police-court Mr. Fordham had before him the case of the Hackney Borough Council v. Mr. Eldridge, which was set down for hearing by direction of the Court. The claim of the Council was for 39l. odd in respect of the cost of paving in Riseholme Street, Hackney. Mr. Eldridge appeared for the Council; Mr. Eldridge was for the defence. The matter came before Mr. Chapman at the Court over a year ago, when he decided against the Council. The matter was stated for the opinion of the Superior Court, but was thrown out on technical grounds. The Council then rescinded its apportionment, and went through the proceedings under the Metropolitan Management Acts *de novo*. In due time the matter again came before this court on a new summons, and on October 26 Mr. Fordham was asked to hear the case, but declined to do so, holding that the matter was *res judicata*. He granted the defendant 14 guineas costs. The Council then applied to the High Court for a *mandamus* compelling the Council to hear the case, which was granted. Mr. Eldridge then applied for a *mandamus* compelling the Council to pave Riseholme Street, which was a portion of an ancient thoroughfare known as Wick Lane, which was a thoroughfare connecting Hackney with Old Ford. After the opening of Victoria Road in 1848 the Commissioners of Woods and Forests came to an arrangement by which certain Crown lands were built upon, and the character of the neighbourhood was altered. Wick Road and Cadogan Terrace were at either end of Wick Lane, were paved at the public expense, but Wick Lane itself, which afterwards became Riseholme Street, was not touched. At that time there was a market garden on one side and day buildings on the other. After 1863 houses were built on the market garden, and the thoroughfare became a street, intended, within the meaning of both the Acts of 1855 and 1863. Mr. Eldridge argued that the thoroughfare was a street in 1850, and then repaired by the old Highway Board, but Mr. Fordham said that he could not hold that a council

in buildings on one side and a market garden on the other. When the houses were built on the market street, it became a street, and a new street within the of the Metropolis Management Acts. He should make an order for the amount claimed, with 5% costs. Mr. Beven then asked that the 14% costs given on occasion should be refunded, but Mr. Fordham said that the case came there through the *laches* of the complainant, and would make no order. Mr. Beven said that he was then to argue the case as he had done now, and an order would be done if the defendant were allowed to keep the defendant had had two sets of costs. Mr. Fordham refused to alter his decision.

## CORK EXHIBITION.

arrangements for the Cork Exhibition, which is to open on a fine day, says the *Irish Times*, and already the vicinity is quite unrecognisable as its old self, with its many of halls, pavilions, bandstands and artistically planned pleasure grounds. The clang of ironwork and the hammer on woodwork are to be heard along the river day and night. Weekly—almost daily—new wonders are being added. Cupolas, minarets and ornamental designs shoot up from the Corkonian rejoice that he belongs to a city which has the enterprise to originate, the zeal and grit to push through all deterrents, and the skilled hands to bring to such an imposing manifestation as this. He has, of his own—and this, too, is no less a source of pride—that he was helped incalculably by the possession of the site. Happy, indeed, was that choice, and the wonder at the charms of the Mardyke and the Sunday's Well river have not ere this been exploited in some such scheme. The Exhibition grounds and buildings lie in the quarters of a mile of some of the loveliest river banks to be commanded anywhere. With the incomparable view on the one side and the unsurpassable Lee on the other, the Exhibition is, indeed, laid in a bed of loveliness. Under, then, if Cork enthusiasts have been known to visitors from other cities with the radiant query, "Is it not excitement with you about the Cork Exhibition?" the present state of the works, it may be said briefly the degree of preparedness is sufficient to show that the Exhibition will be the most spacious and imposing that has

ever been held in Ireland. The Industrial and Machinery Halls, the Concert Hall, the Agricultural Buildings, the Refreshment House, the Art Gallery and the various pavilions all constitute an impressive and bewildering group, looming up, as they do, in the midst of tall trees and riverside foliage. The length of the riverside is 1,133 yards, and the average breadth of the grounds is 500 feet. The most imposing building in the group is the Concert Hall, which towers above all others and is conspicuous also by its elegance of design. The style of architecture is Spanish Renaissance, and each of the four corners has a handsome square-shaped tower. It will give accommodation to an audience of some 2,200 people, and the big platform has seating accommodation for about 300 performers.

A general idea of the lie of the Exhibition works may be briefly conveyed. Presumably, few visitors to Cork have failed to familiarise themselves with the historic Mardyke. This was laid out as a private avenue more than a century ago by a Dutch settler in Cork who had attained considerable wealth, and at its head, furthest from the city, is the mansion which for many years served as the residence of the judges when on assize. During the last century one side of the Mardyke was largely built upon, but the other side—between the Mardyke and the river—has until the present moment escaped the inroads of the builder, save for the few residences set in spacious gardens which have been there as long as the present generation of Corkonians can remember. Otherwise the land has lain in meadow and pleasure gardens, and one portion has served for the uses of a cricket club and a lawn tennis club. It is on this exquisite site that the Exhibition buildings have been erected and its grounds and landscape gardens laid out. The main group of buildings—the Concert Hall, the Machinery Hall and the Industrial Hall—lies along the Mardyke, in the order named, as you go from the city, beginning slightly above the cricket ground and reaching as far as the "Ferry Walk." The Ferry Walk splits the grounds into two sections, and beyond it are the considerable pile reserved for the Department of Agriculture and Technical Instruction. The department have also a considerable section adjoining the Industrial Hall. The larger buildings of the Exhibition run along the Mardyke, and the riverside portion of the grounds is more reserved for scenic purposes, with an artistically-fashioned pavilion, bungalow or kiosk judiciously bestowed here and there for the accommodation of other features, thus also yielding extra elements of charm to the riverside picture. Beyond the Ferry

BY SPECIAL APPOINTMENT

Telephone, No. 680 HOP.

Walk and on the riverside of the department's buildings is a most elaborate switchback railway, and near it, on the city side of the Ferry Walk, a vast "water-chute" with a dizzy and exhilarating descent into the fair Lee itself. Just about here the river winds gracefully by skirting foliage, and the terraced charms of Sunday's Well at the other side look down smilingly on the fair scene. Rhododendrons grow liberally just about here, and in their season of bloom the flowers lap and kiss the water most delightfully. Needless to say, these natural features have been held sacred in laying out the grounds. There is preserved throughout the whole plan a thorough artistic balance of the useful and the decorative—no obtrusion of bulk where it should not be, and a very admirable economising of space throughout.

The Industrial Hall is of great extent, and already stalls are being erected and put in position. Representatives of various countries are to be seen hovering about—here a dusky baggy-trousered Turk with fez cap, here a fair-haired German, here an animated Frenchman and yonder a knot of active, athletic niggers, all imported as a kind of preliminary to the burst of splendour that is to dazzle on us on May 1. The exhibits will be representative of every branch of trade and manufacture in the British Isles—and France, Germany, the United States, Japan, Russia, Turkey, Egypt and Persia are also sending noteworthy specimens of their produce and manufacture. There are a large number of arcades in this Industrial Hall, and it is remarkable that the applications for space in this as in the other sections of the Exhibition largely exceeded the area available. The entrance to the Industrial Hall is surmounted by a handsome dome, and the portico is light and graceful. The total area of the building is 150,000 feet. The Machinery Hall is also a very formidable looking structure, lying adjacent to the Industrial Hall. Of the three larger buildings named the Concert Hall is in the most backward state at present, the front being as yet only scantily filled in. However, the workmen are now such experts in dealing with the ironwork and plaster that no apprehension is entertained as to its being ready for the opening ceremony. All round the place the hum and bustle of earnest work is to be heard, and the various sets of operatives are most capably directed.

A feature of the Exhibition will be its elaborate walks and pleasure gardens. This work has been entrusted to most efficient hands, and already the outlines of the charmingly artistic scheme strike the eye. In the grounds and on the river bank is located a very pretty and spacious restaurant.

This has now been completed, and, with its trim veranda and shining paint, it looks a charming object in the park. Then there is a temperance restaurant, very artistic and also, three tea-houses, and a "Cave of the Winds" and "Turvey House"—these latter affording a suggestion of lighter and merry-making features of the Exhibition. The three band stands are conveniently placed through the grounds. The Turkish Pavilion and the Canadian Pavilion already pose large on the scene.

The section of the Department of Agriculture and Technical Instruction is being pushed on vigorously. To-day the President of the Department, Mr. Horace Plunket, secretary, Mr. Gill, and Mr. Coyne and Mr. W. T. Macarone were on the site actively at work arranging matters in detail. The exhibits will include displays of work from various technical schools in the country, and in England, Scotland and elsewhere. A section will also be devoted to large maps and statistical diagrams. Fisheries, too, will have a special representation, and raw materials, minerals, stone &c. will be adequately provided for. Working machinery, steam looms, and the output of the smaller Irish cottage industries will, of course, be suitably represented, the educational value of the exhibits being well held in view. The Department has taken 50,000 square feet of the Industrial Hall, and it is in this section that the Industries Section of their work will be illustrated. The other and more spacious area reserved for the north of the Ferry Walk will be devoted to more scientific and agricultural exhibits.

The Fine Art Gallery should prove one of the very attractive features of the Exhibition. The committee entrusted the duty of securing pictures on loan to Mr. S. Lucas, son of Mr. Lucas, R.A., and the results of his efforts have been most satisfactory. He went busily to work in London and elsewhere collecting high-class works of art, and it is computed that the Exhibition is open pictures of the value of 150,000. It is on view. Some very noteworthy works will be included in these, and the educational value of such a fine collection cannot fail to be appreciated.

The committee have been fortunate enough to secure for use—on exhibition—of practically all the machinery necessary for lighting and motive purposes. Powerful engines have been supplied for this purpose by Messrs. Ruston & Procter, Messrs. Robey, of Lincoln; Messrs. Greenwood & Batley, of Leeds; Messrs. Mather & Platt, of Manchester; the Thames Iron Works, and Messrs. Tinker, Shenton & Co., Hyde, Manchester.

## THE WEEK.

IF the distribution of the late CECIL RHODES'S bountiful contribution towards education were left to his trustees untrammelled by stringent conditions, there is little doubt that University College, London, would from its merits have received a large proportion, if not all of the money. In modernity it is unsurpassed in this country, and the possessors of scholarships would be better prepared for future work, especially in new regions, if they were able to pass its examinations than if they had sacrificed three or four of the best years of their lives in dawdling through the Oxford half-time system, as the ex-Professor E. RAY-LANKESTER describes the existing educational process in his university. The University of London, which is now a teaching university, has not the wealth of Oxford or Cambridge, and appeals have therefore been made for the money that is needed to equip University College for higher teaching and research. According to Lord REAY, the estimated sums may be divided as follow:—(a) 250,000*l.* for completing the college buildings, thus providing adequate accommodation for teaching and research in such important departments as modern languages, chemistry in all its branches, geology, physiology, botany, engineering in all its branches, advanced medical studies, &c.; (b) an annual income of 6,000*l.* a year, or a capital sum of 200,000*l.*, for departmental expenses, including maintenance of laboratories, libraries, &c.; (c) a yearly sum of 20,000*l.*, or a capital sum of 700,000*l.*, for the endowment of existing endowed chairs, and for the foundation of additional professorships and lectureships. A comprehensive statement of the needs of University College in all departments has been published, and should receive attention from those who take an interest in higher education. The Department of the Fine Arts is described as already well equipped and fairly endowed, but it is overcrowded, and needs more space for the development of special departments such as sculpture and etching. Space for these can be found in the north wing, when the extensions proposed have been made. The gallery of casts required for the archæological school would be available also for the fine-art students. Endowments are needed for a teacher of sculpture and for a lectureship in the history of art. For each of these a sum of 150*l.* a year would suffice, so that the total additional endowment required by the department is 300*l.* a year, equivalent to a capital sum of 10,000*l.*

WE have repeatedly pointed out the risks which architects, engineers and contractors accept when they make arrangements with corporations and other local bodies without taking the precaution to have the agreements stamped with the common seal in each case. There is so much confidence in a public authority the individual security is neglected. Last week another instance of what we may call the fatality came before the Courts. Mr. LAWFORD, a civil engineer, who is known in connection with drainage work, sought to recover 169*l.* 14*s.*, remuneration for preparing a report and plans for a scheme of sewerage which the Billericay Rural District Council were about to undertake. The Local Government Board held an inquiry and approved of the plans and estimates. Tenders were sent in, but one was not accepted. It was not denied by the defendants that Mr. LAWFORD'S work was duly performed, or, in other words, there was no defence except the fact that as the common seal was not affixed to the agreement, it was therefore of no value. It is always a disagreeable duty for a judge to be compelled to give a decision when he knows that by it gross injustice must be done to a plaintiff. But so long as the judgment which was given by Lord DENMAN in *CHURCH v. Imperial Gas Company* is unreversed there is only one course open, and that is to say that an agreement is illegal which is without a common seal. Lord DENMAN'S words should be remembered as a warning by all who have business with corporations of all kinds, for he said:—The general rule of law is that a corporation contracts

under its common seal; as a general rule it is only in that way that a corporation can express its will or do any act. That general rule, however, has from the earliest traceable periods been subject to exceptions, the decisions as to which furnish the principle on which they have been established, and are instances illustrating its application, but are not to be taken as so prescribing in terms the exact limit that a merely circumstantial difference is to exclude from the exception. This principle appears to be convenience amounting almost to necessity. Wherever to hold the rule applicable would occasion very great inconvenience, or tend to defeat the very object for which the corporation was created, the exception has prevailed; hence the retainer by parole of an inferior servant, the doing of acts very frequently recurring or too insignificant to be worth the trouble of affixing the common seal, are established exceptions; on the same principle stands the power of accepting bills of exchange and issuing promissory notes by companies incorporated for the purposes of trade, with the rights and liabilities consequent thereon." In *HUNT v. Wimbledon Local Board* the architect's plans were utilised, but although the Board had benefited by them the claim for payment was rejected on the ground of informality. How such a defence can be set up by an English authority is beyond comprehension, but the fact remains that payment can be successfully evaded by the absence of a seal.

WHEN RAILTON'S column in Trafalgar Square was surmounted by the statue of NELSON, a sailor exclaimed that the Admiral was mastheaded, which in his eyes was a crime worse than any mutiny. The column was not the best kind of memorial to have adopted out of those available in the competition, but it has now become a landmark which no Londoner would care to see removed. The plans of the Charing Cross, Hammersmith and District Electric Railway and the London United Electric Railways propose the execution of works in the immediate vicinity of the memorial. The Navy League are willing to oppose the Bills in order that measures might be adopted for the safety of the column. But the League's *locus standi* is not recognised by any Parliamentary committee. The square probably belongs to the Office of Works, and on that account no hazardous tunnelling will be undertaken. At present, however, neither the Navy League nor the public have any security on the subject. The Navy League are, moreover, apprehensive that the water-level of the entire locality will also be inevitably disturbed. If the new works would put an end to the dispersion of dirty water few would regret the loss, for what is needed are fountains of much greater capacity.

THE outlay which is required to produce some trade catalogues is larger in amount than the public in general can imagine. For example, in 1899 Messrs. SHANKS & Co., LTD., of the Tubal Works, Barrhead, near Glasgow, expended 7,000*l.* on a catalogue of their latest varieties of sanitary appliances. They found that another firm in Barrhead, Messrs. SMITH & SAUNDERS, recently issued an illustrated catalogue of sanitary appliances, the drawings and designs in which, and the descriptive notes, dimensions and other letterpress were in many instances identical with or only colourably different from those in Messrs. SHANKS & Co.'s catalogue. An action was brought in the Scottish Courts to interdict the publishing and circulating of the imitation. In defence it was said that the original possessed no special information, an absurdity which denotes the lack of any valid excuse. The action was, however, settled on the following conditions, viz.:—(1) That Messrs. SMITH & SAUNDERS should take out of their catalogue a large proportion of the pages of which Messrs. SHANKS complained; (2) that they should call in all copies of the offending catalogue issued by them; and (3) that they should pay Messrs. SHANKS & Co.'s expenses as between agent and client. It is not often so much forbearance is exercised in a case of breach of copyright. But from their position as manufacturers of sanitary goods Messrs. SHANKS & Co. can afford to take the lion's part, and be generous towards adversaries.

## ENGLAND IN EGYPT.

**A**N English architect who reads Lord CROMER'S report on the finances, administration and condition of Egypt and the Soudan is likely to desire that building could be of more account in the transformation of that ancient country. The part played by engineering is the most important, and amidst so many examples which recall its ancient greatness, architecture has to be content to serve as a useful but humble auxiliary. The work which is in the course of accomplishment is a testimony to the organising power of Englishmen, and every one should desire to have the privilege of a share in what is the most remarkable example of progress in modern times. Japan has, no doubt, advanced further than Egypt, but it should be remembered there was a general desire to co-operate in the change from old ways, while in Egypt the mass of the people were indifferent, if not antagonistic, to reforms, and unhappily there were too many influential advisers whose interests were served by exciting prejudices against all English proposals.

There are, according to Lord CROMER, demands for the construction of public buildings springing up on all sides. If they are not met, it is not through want of money. The reason is the existing staff of the Public Works Department is at present insufficient, and therefore "some considerable time must elapse before all the public buildings which are required can be constructed." In an emergency of the kind recourse should be had to English architects. Why should not Englishmen gain at least as many commissions for private buildings in Egypt as are obtainable by French architects? The latter have no doubt a footing in the country, where they aid in the promotion of French interests, but their arrival was mainly owing to official needs. It may seem narrow-minded to introduce professional subjects in connection with the colossal task before Lord CROMER and his assistants, but we consider that much can be done to help them by facilitating relations, if only in business, between Englishmen and Egyptians. At the present time an Egyptian who requires modern work, no matter of what class, usually looks to France for it, for to his mind an Englishman appears only as an official or a tourist.

In 1901 the sum expended on new public buildings was £127,000, which is almost equivalent to a like amount in British money. The sum does not include the outlay on prisons, or for sanitary works, which are charged to other administrations. In Upper Egypt ten new buildings were completed, and in Lower Egypt twenty-six buildings were either completed or in progress, of which the estimated cost was 471,650*l*. The most important are:—The Egypt Museum at Cairo, the Arab Museum and Khedivial Library, the Geological Museum, the residence for the Director-General of the Antiquities Department, the Customs buildings at Alexandria, a central fire-station at Cairo, a Court of Appeal, post offices, a Government printing office, &c. Building is required in various forms. The Mecca pilgrimage has made it necessary that bakeries, storehouses, kitchens and other enclosures should be constructed at Tor. Two stone hospitals have also been erected, and the question of providing barracks for the pilgrims is also under consideration. About 25,000*l*. had to be expended on providing new prisons. A classification has been made of all the mosques in the country, showing their state of repair, and they will be gradually taken in hand as funds are available. In 1901 the sanitary condition of 1,170 village mosques was improved. Alterations and improvements in the lunatic asylum at Abbasieh have cost 21,000*l*. But, as in England, there is insufficient accommodation for the mentally afflicted, and another large asylum is much needed.

There are about 10,000 village schools in Egypt, which as a rule are kept by poor men who earn a living mainly as reciters of the Koran. The schools are often housed in ill-lighted and insanitary premises; the teachers are usually illiterate, and not infrequently blind. On such a basis it is difficult to found a system of popular education. The money that has been placed at the disposal of the Minister of Public Instruction will be applied to appointing inspectors and increasing the subventions to schools in which there is some efficiency. But Lord CROMER recognises that the provision of suitable buildings is an immediate requirement. A

sum of about 6,000*l*. has been subscribed for the construction of a technical school at Alexandria. Lord CROMER expresses his cordial satisfaction not only on account of the institution, which will arise, but as an indication that the Egyptians are beginning to take some real practical interest in the management of their own affairs. There is a technical school at Boulac which gives a sound workshop training to future mechanics, smiths, founders, joiners, decorative painters, engravers, &c. The SULTAN sent three Turks to complete their studies in the school. The Mansourah Technical School has become an industrial school for carpentry and joinery, and in that way Lord CROMER believes its sphere of usefulness will be widened. There is a School of Engineering, but the buildings are bad, and radical changes will have to be made. According to Lord CROMER, the demand for native engineers is far in excess of the supply, and under the circumstances "it is not satisfactory that the annual output of the only civil engineering school in Egypt should show so little promise of becoming equal to the pressing needs of the country."

Engineering is necessarily the power that is most called upon in Egypt. Irrigation works will alter the character of the country, and a large sum has been devoted to remodelling the systems of both Upper and Lower Egypt. The greater part was expended in connection with the scheme for the redistribution of water which will be for disposal when the Nile reservoir at Assouan is complete. The outlay is large, for a sum of about 490,000*l*. has been spent upon improvements, in addition to the sums required for the new weirs at the Barrage and the dam at Zifta. But the irrigation works are not to be confined to Egypt. It is contemplated to construct some within the Soudanese territory, and arrangements will be made in order to obviate the political objections that would arise from a reservoir anywhere inside the Abyssinian frontier. Lord CROMER testifies to the energy and ability of Mr. FITZMAURICE, the resident engineer at Assouan, who has accepted the appointment of engineer to the London County Council. The Assouan dam was also accomplished quickly. Lord CROMER does not forget the representatives of Sir JOHN AIRD, and says it is certain that without the untiring labour of Messrs BLUE and MCCLURE the works could not possibly have been so effectively carried on—they will be completed a year before the contract time. One remarkable fact in connection with these works is the diminution in the *corvée*, or men called out for 100 days to guard the banks of the Nile during the season of flood. In 1895 the number was 36,782, in 1901 the total had fallen to 8,763. Indeed, Sir WILLIAM GARSTIN says that last year no *corvée* at all was demanded to guard the banks in Lower Egypt north of Cairo, and this is unprecedented in the history of Egypt. It is expected that the *corvée* will be reduced to a very large extent, if it is not abolished.

Filter-beds are in course of construction for the improvement of the water-supply of Alexandria. The towns of Keneh and Assouan are to be supplied with pure water which will be obtained from underground sources. Pipes have been laid and designs are being prepared for the buildings and pumping machinery. A drainage system for getting rid of the rain-water in Cairo, which used to flood the streets after every storm, has been introduced. The water will be discharged into the Ismailia Canal, and in order that there may be no stoppage when the canal is full an engine and pump worked by electricity have been installed at the outlet.

The irrigation works could not be carried out without affecting the beautiful temples at Philæ. It will be seen from the remarks by Lord CROMER, which have been printed on another page, that the selection of the site was imperative. In all cases where past and present come into collision, and there can be no evasion, the past must succumb. To sentimental people this may appear vandalism, but nature is stern, and when men seek for bread it is not to be expected that their hunger should be appeased by looking on a stone. Lord CROMER has the courage to say that it would be unjustifiable to deprive the people of Egypt of the enormous and unquestionable advantages which will be derived from the dam at Assouan because there are artistic and archaeological objections to the works. Frenchmen and Germans have complained of the occa-

onal submersion to which the temples will be subjected. ut in such circumstances archæologists are only the tools politicians. There is no doubt the opposition in England is been attributed to the selfishness of the English aracter, which would, it is believed, have preferred to see natives suffer rather than any inconvenience arise to the urists and pleasure-seekers.

The subject of contracts has been treated in a memorandum by Major JOHNSTONE. Some ill-feeling has existed in this country owing to a supposition that foreigners were referred. It is satisfactory to find that the larger part of the contracts has been placed in Great Britain. There was over half a million sterling expended on materials, and 12,500*l.* is the British share. Out of 345,100*l.* disbursed by the Commissioners of the Debt and the Railway Board, 136,100*l.* fell to this country. It is remarked that where there is keen international competition, Germany and Belgium run us closely. Austria was able to succeed with locomotives and accessories for carriages and waggons, Belgium with ironwork; Germany with ironwork and locomotives. But the only large contracts obtained by Great Britain in international competition were for copper wire, rails and cast-iron chairs. It is not reassuring to learn that an excessive time was taken by a Scotch firm in supplying a floating crane, owing to troubles with workmen. The United States have disappointed the Egyptian authorities, and no further contracts were sent there during 1901. Belgian manufacturers do not serve their interests by invoking the aid of their diplomatic agent to protect them from the just consequences of their own bad work.

In the Soudan it is not to be expected that many buildings will be erected, but about 90,000*l.* was expended last year. Out of that amount a sum of 27,000*l.* was for barracks to house a British battalion at Khartoum. The Gordon College at Khartoum will be finished this year, but at present it can only be employed as a primary school. Under English officers the general condition of the people is changing. According to Colonel NASON, in Berber they are better clothed, and a great deal has been done in erecting new houses and improving old ones. Colonel McKERRELL says that in parts of Dongola the inhabitants are beginning to build for themselves better houses, and to reap the advantages derived from cleanly habits as regards their persons and homesteads. In Senaar Major SMITH states that a good system of wide roads, planted with trees, will be laid out directly; shops have begun to be built and villages settled. In most districts of the Soudan the Moudirs stify to the desire for education, and there is no doubt at avoiding all indications of a military government, though the chief officials are mostly English military officers, has had good results in a country that was fast sinking into primitive barbarism. Taken as a whole, Lord ROMER'S reports, and those of his officials, form conclusive evidence of the benefits which are arising from English administration in English Soudan. In future reports we hope building will be allowed to have a more prominent position.

#### MR. THOMAS HARDY AND WESSEX.\*

SUCH interest as SCOTT imparted to Scotland and Dickens to London, Wessex has gained by the genius of Mr. THOMAS HARDY, a writer of whom English architects should be proud. It would perhaps be nearer the truth to say Wessex has been the most successful of the three territories, and its debt is therefore the greater. Scotland and London possessed already historic renown. Without meaning disrespect to the inhabitants, it cannot be disputed that Dorset, Wiltshire and Hampshire, the region where Mr. HARDY'S tragedies and comedies were enacted, were not much known to the rest of the world.

A novelist is allowed to devise his own setting, just as a figure painter can invent a background. But the people of Wessex are apparently desirous everybody should be aware that Mr. HARDY was descriptive rather than creative. Already the "Wessex of THOMAS HARDY" has been made the subject of a book by Professor WINDLE,

and in the "Wessex of Romance," by Mr. WILKINSON SHERREN, every available fact which would tend to illuminate Mr. HARDY'S treatment of it has been incorporated, and "aiming at the completest exposition of the subject possible, the well-known novels have been approached through a character study of the people, thus providing a rough sketch of the author's material."

Since Mr. HARDY has elected to be true to nature in its local manifestations, not only of scenery, but of men and women belonging to a particular time, it is only right that those who possess local knowledge should testify to his fidelity. But we must protest against any attempt to assert that photography is to supersede painting in the work of a novelist. Who cares, for example, whether WATTEAU'S *Isle of Cythera*, or TURNER'S *Ancient Italy* and *Modern Italy* have been derived from any one spot in Europe? They may be as unreal, if compared with existing landscapes, as the noble architecture to be seen in the wall-paintings by RAPHAEL in the Vatican. If the novelist draws lifelike characters we are satisfied, although they may be to us no more than the inhabitants of the Kingdom of Nowhere or Weissnichtwo. It is allowable in fiction to transfer the Forest of Arden from Warwickshire to any part of the Continent, and in defiance of geography to construct seas and harbours in Bohemia.

It should also be remembered that accuracy in surroundings is no necessity imposed by the finer taste of our time. SCOTT was most laborious in his descriptions, and yet they were the pages which gave the least pleasure to the readers of his novels. No Dutch or pre-Raphaelite painter was more anxious to produce truthful representation than BALZAC. THÉOPHILE GAUTIER at times appears, as in his "Captain Fracasse," to be no less intent on giving relief to mere accessories than to his characters. FLAUBERT expatriated himself and spent long years in study in order that the scenery and properties of "Salammbô" might sustain the scrutiny of archæologists. Whether Mr. HARDY was right or wrong ("the safe phrase," he says, "of evasive controversialists") in his respect for realism is a question which would need the composition of a treatise on æsthetics and literary art as the answer. His own nature impelled him to that mode of treatment, and then his training must have induced him to look on external things after the manner of an architect united with that of a land surveyor. On this subject we have the testimony of Mr. SHERREN, who says:—

It is not surprising to find two architects, Owen Graye and Edward Springrove, in Mr. Hardy's first novel, "Desperate Remedies," though it is a cause for wonder when the same profession is introduced into "A Pair of Blue Eyes" and "The Laodicean," in the persons of Stephen Smith and George Somerset respectively. Certainly, from the point of view of a novelist, the openings provided by characters moving in the milieu of a peripatetic profession would, in themselves, be very fruitful of developments, especially if the writer himself had trodden the same path and thus proved the possibilities of it. Some readers of the Wessex novels may cavil at the insistence of the architect's point of view, and find fault with the detailed treatment of buildings, but it is only referred to here as a proof of the personal note in works of a distinctly impersonal type. "A Pair of Blue Eyes" illustrates the artistic use of material probably gathered for technical purposes, dealing as it does with "the craze for indiscriminate church restoration," and the lives of the people associated with the attempt to rehabilitate a sacred edifice. A better example is found in "The Laodicean," where George Somerset and Havill are deputed by Paula Power to renovate Castle Stancy. At the opening of the theme this historic mansion is broadly sketched from the outside: "The castle was not exceptionally large, but it had all the characteristics of its more important fellows. Irregular, dilapidated and muffled in creepers, as a great portion of it was, some part—a comparatively modern wing—was inhabited. . . . Over all rose the keep, a square, solid tower, apparently not much injured by wars or weather, and darkened with ivy on one side, wherein wings could be heard flapping uncertainly. . . . In spite of the habitable and more modern wing, neglect and decay had set their mark upon the outworks of the pile, unfitting them for a more positive light than that of the present hour." This is only a preliminary sketch in the presentation of the fine old building, whose interior is then minutely examined, described and criticised with a fine enthusiasm, the differences of opinion between Somerset and Havill suggesting actual experience of the conservatively inclined in this domain of work. All the capacity of an archi-

\* *The Wessex of Romance.* By Wilkinson Sherren. With illustrations. (London: Chapman & Hall.)

fect is utilised in the treatment of Castle Stancy, but it is lifted out of the dead region of technical comment by the power of the artist, which has animated the castle with a personality of its own. Further, the capacities brought into play by an architect's training are observable in the harmonious construction of the Wessex novels, the infinite detail being used with fine proportionate sense and subordinated to the main structural themes, without any undue emphasis of the subsidiary parts.

In dealing with architecture Mr. HARDY does not allow himself to over-emphasise the art. There is no parallel in any of the books to such treatment as we see in M. HUYSMANN'S "La Cathédrale." He is too much of an artist to permit the attention of the reader to be monopolised by any building, however important. But whenever Oxford, Wimborne, Sherborne, Dorchester or any other city, town or village has to be noticed, we always find that any indication of the character of a building is sufficient to recall it to the extent desired by the writer and no more. With Mr. HARDY affection for architecture never overcomes the sense of proportion. Although it is possible to have a clear vision of Casterbridge, its streets and lanes, the description does not diminish the sympathy of the reader for the troubles of the Mayor, that remarkable type of the successful man who cannot escape NEMESIS and must pay for the weakness of his youth. Every reader, we suppose, is moved when the two portraits of the D'URBERVILLES look down, like Fates, upon TESS, but it is only out of pity for the doomed victim, the last act of whose tragedy is to begin in the mouldering mansion once possessed by her family. To it she is indifferent, but of her father's cottage it is said:—"Part of her body and life it ever seemed to be; the slope of its dormers, the finish of its gables, the broken courses of brick which topped the chimney—all had something in common with her personal character." This may seem exaggeration to many, but to those who are acquainted with what is related by RIEHL and others about the influence of land and other fixed things on peasants of a stay-at-home class, the statement will be only an expression of cause and effect.

According to Mr. SHERREN, pilgrims from all parts of England and America have journeyed to Wessex "to find a basis for greater love in greater knowledge." The descriptions of scenery could hardly fail to be attractive. When reading the novels it is easy to believe that Wessex is a remnant of the old England which was ignorant of railways, Reform Acts and school boards. To a generation familiar with the greater part of the globe, it is a surprise to hear of a district where Paganism is not extinct, and naturalism accepts few restraints. The impression made by Mr. HARDY'S pages is that vegetation and the moving beings who live amidst it have a peculiar relationship. At one time landscape-painters used to have any figures which were required put in by other hands, but Mr. HARDY resembles the French painters of the Barbizon school, whose landscapes would be lifeless without the figures, and the figures incomplete without the trees, skies and mists. Admirers of Mr. HARDY'S books will allow they find it difficult to think of any of the characters apart from their surroundings. The backgrounds, as he says, have been always done from the real, and they impress us with objective force. On that account the "Synopsis of the Wessex Novels" has an additional use besides that contemplated by Mr. SHERREN, for it reveals the difference between what was formerly called the "argument," or, as the Germans say, the "Auszug" of each story, and the artistic combination of characters, landscapes, and dwellings produced by the author.

But the characters or figures, if they could be considered abstractedly, will be found to have remarkable importance. Old JOHN DURBEYFIELD is made to say:—"I'm thinking of sending round to all the old antiques in this part of England, asking them to subscribe to a fund to maintain me. I'm sure they'd see it as a romantical, artistical and proper thing to do. They spend lots o' money in keeping up old ruins and finding the bones of things, and such like; and living remains must be more interesting to 'em still if they only knowed o' me. Would that somebody would go round and tell 'em what there is living among 'em, and they thinking nothing of him." Not since SHAKESPEARE'S time have so many welcome representatives of "the constant

service of the antique world" appeared in literature as Mr. HARDY has introduced. After reading Mr. SHERREN'S book we dare not say they are literary creations, for similar grey-beards were common in the farms of Wessex. Wherever they come from, a reader is always glad when he has to give heed to their wise saws derived from a most restricted experience of life. The barn, the public-house, the cabin and the church mark the boundaries of their world, and yet it cannot be said they are degenerated members of the English race. It is otherwise with their children. Mr. SHERREN tells us how "the rustics have awakened to self-consciousness, and the recognition of their own peculiarities has deformed their nature and interfered with its natural growth. Habits and customs, the deposit of centuries, are cast aside for the whims of an hour, because the quaint and steadfast country ways have been fretted by the fever of modern unrest." It must not, therefore, be assumed that the Wessex of to-day corresponds in all details with the region which Mr. HARDY revealed.

There is another Wessex which has yet to be made known. Mr. HARDY once described to a local archaeological society some barrows near Dorchester, or his Casterbridge, which he believed belonged to a Romano-British period, and in his paper he said:—"It would be a worthy attempt to rehabilitate the living Durnovaria of fourteen or fifteen hundred years ago as it actually appeared to the eyes of the then Dorchester men and women, under the rays of the same morning and evening sun which rises and sets over it now. What kind of object did Dorchester then form in the summer landscape, where stood the large buildings, how did the roofs group themselves, what were the gardens like, if any, what social character had the streets? What were the customary noises, what sort of exterior was exhibited by these hybrid Romano-British people, apart from the soldiery? Were the passengers up and down the way few in number, or did they ever form a busy throng such as we now see on a market day?" Why does not Mr. HARDY endeavour to answer the questions which he has posed? In the eyes of architects ancient Rome is a kind of heritage, for the empire is to them what it is not to any other men. To a lover of antiquity, as Mr. HARDY'S old men and their old customs prove him to be, it would not be hard to revive all that is discoverable about the Romans in England. The people who dwelt around Casterbridge probably were not unlike those who are portrayed in his story. In the same spirit as THACKERAY, Mr. HARDY believes it is possible to have a novel without a hero, and it is not recorded that they abounded in the early times when "the Romangs, who was a terrible double-backed people an' strong as 'osses" ruled in Dorset. A Romano-British romance would be a change of occupation, and the result would add new importance to Wessex. Mr. SHERREN'S chapter on "The Paganry of the Past" shows that in other times Wessex, in spite of its seclusion, was the theatre of many momentous events. His book is valuable for its intrinsic interest, but it is also of much use as an auxiliary to the numerous admirers of Mr. HARDY'S gifts; for it reveals to them on what deep foundations the Wessex romances have been based.

#### SOCIETY OF ANTIQUARIES OF SCOTLAND.

THE monthly meeting of the Society was held in their library at the museum, Queen Street, on Monday last, Mr. Robert Munro, M.D., LL.D., in the chair.

The first paper was a notice of the heraldry in some of the old churchyards between Tain and Inverness, by Mr. W. Rae Macdonald, F.S.A.Scot. Beginning with the burial-slabs in the roofless ruin of the ancient church beside the old collegiate church of Tain, two of which show shields of arms of the family of Ross, he next noticed the tomb of Finlay M'Leod, abbot of Fearn, in the abbey church of Fearn, which has still the effigy of the abbot under an arched and decorated canopy, with a shield in the centre bearing his arms, and two smaller defaced shields at the sides. Near the centre of the north wall of the church is a shield with lion rampant, and at the east end a Balnagoun monument of the eighteenth century. At Nigg, besides the Celtic sculptured stone, there is a recumbent slab with a Gothic cross and sword, which has been used a second time for a shield of arms of Alexander Gair, 1659. At Invergordon Castle is the fine Celtic slab from Hilton of Cadboll, which was also utilised a second time for an inscription on one side commemorating Alexander Duff and his three wives,

76, with a shield of arms. In the churchyard of Ilchrist, near the Muir of Ord, is a stone with some unusual mortuary devices, and at Killearnan a mural tablet with arms of the Mackenzies of Muirtown. In Kilcoy castle is the finely-sculptured heraldic mantelpiece of the hall, the decoration of which consists of three shields of arms enclosed by circular bands on which the mottoes are inscribed, while at either end is a mermaid playing on a harp. The arms on the shields commemorate certain marriages in the family, and the date is 1679. Several shields of arms also occur among the external decorations of the castle, and in the drawing-room there is an interesting oak cabinet with heraldic decoration, which is said to have been carved by Master Alexander Mackenzie. Against the garden wall is a large heraldic panel, said to have been brought from the Bishop's Palace, Fortrose, bearing the full achievement of Scotland and the arms of Bishop James Hay, 1537. At Redcastle there are several heraldic sculptures, one of which is interesting as assembling the arms of Finlay M'Fead, abbot of Fearn. At Fortrose are three canopied tombs and several stones with interesting heraldic sculptures, which, as well as those at Rosmarkie, were fully described. The churchyards of Glenelg, Glen Convinth and Kirkhill having been noticed, the Greyfriars Churchyard in Inverness and the more interesting cemetery of Chapelyards yielded many interesting heraldic monuments. The paper was illustrated by a large number of drawings of the principal types of heraldic sculpturings used in the monumental art of this district of the Highlands, chiefly in the seventeenth and eighteenth centuries.

#### *Mull of Kintyre Stone Fort.*

In the second paper Mr. John Fleming gave a notice, illustrated by photographs, of a well-preserved stone-built fort near the Mull of Kintyre. It is a circular structure, massively built, and situated on a rocky knoll overlooking the sea, and only 300 feet above the shore, while it also overlooks a glen called Borgadaill, doubtless so named after the fort. The circular wall, which is about 12 feet thick, encloses an area of about 36 feet in diameter, and still stands to a height in some parts of its circumference of 7 or 8 feet, though the inside level is higher, and the wall nowhere shows more than about half the height of the outside. The doorway is on the north-west, and is about 3 feet 6 inches wide at the outside and about a foot wide at the inside face of the wall. There are no signs of chambers in the thickness of the wall, but there are apparent remains of buildings within the enclosed area. About a mile further west there is another fort of a different character, being a rock precipitous to the sea, and enclosed by three stone-built walls, and about midway between it and the Borgadaill fort there are the foundations of another circular structure, but of smaller size. Such forts are numerous in Kintyre.

#### *Curious Stones.*

In the third paper Mr. Thomas Ross, architect, F.S.A.Scot., gave a description of four stones found at various places in the neighbourhood of Auchterarder, which appear from their similarity of subject to belong to one group, their common characteristic being that they represent riders in chariots drawn by horses, leopards, or other animals. The best preserved example belongs to Mr. A. Drummond Forbes, Millearn House, and is inscribed "Luna," with the personified representation of the moon in her chariot. Another, well preserved, which is in the Perth Museum, appears to have had a similar personification of the sun, while a fragment in the same museum shows a mutilated head with the inscription "Mercurius," and at the ruins of Auchterarder Castle there is a stone, rather wasted from exposure, but still distinct enough to show that it belongs to the same class of representations. These stones form a remarkable group, the original history of which appears to be lost. The practice of representing the gods in chariots descended from classic times, and they are probably the outcome of the revival of classic feeling at the time of the Renaissance. Another stone brought under notice undoubtedly belongs to the period of the Roman occupation. This is the one found at Camelon, near Falkirk, in December last, and now in the National Museum. It represents a Roman soldier trampling triumphantly over a prostrate Caledonian, a favourite subject with the Roman sculptors, and especially with the monumental artists of the Second Legion stationed on the Wall of Antoninus in the second century.

#### *Perthshire Stone Circle.*

In the next paper, Dr. Christison, secretary, gave a notice of an unrecorded fort and a stone circle at Wester Torrie, near Clandier, Perthshire. The fort is situated in the parish of Madock, below the junction of the Keltie with the Teith, close to the south bank of that river. It is a conspicuous elevation, with a circular work of stone on the summit, overgrown with turf, and so confused that it cannot be measured, but the wall appears to be 6 or 8 feet thick, and the interior is 20 to 40 feet in diameter, surrounded by remains of outer fortifications and trenches, which extend the total dimensions

of the fort to about 150 by 250 feet. It has been designated on the Ordnance map as the site of a Roman camp, but there is no sufficient reason for assigning to it a Roman origin, as its character is evidently that of a native fort. The stone circle close to the fort has not been marked on the Ordnance map, and is otherwise unrecorded. It consists of five stones placed at equal distances, with an interspace on one side, which was probably filled by a sixth stone. The highest stone stands 3 feet 8 inches above the ground, the others being smaller, though their bulky forms give them some dignity. In the last paper, Mr. James Barbour, F.S.A.Scot., gave an account of the excavation of a quadrangular earthwork with rectilinear sides and rounded corners at Rispaun, in Wigtownshire, which is locally known as Rispaun Camp, and had the reputation of being a Roman camp. Before excavation, the plan exhibited a great ditch on three sides, with a rampart in front and traces of another in rear. On the fourth side the ground was levelled, but the line of the ditch was still visible. The excavations disclosed the form and depth of the ditch and the structure of the ramparts, and also an outer ditch, of which no trace appeared on the surface. The interior of the enclosure measures about 223 feet by 170 feet within the ditches. The main ditch is 25 feet wide and from 15 to 17 feet in depth. There is only one gateway on the centre of the north-east side, 20 feet wide, and with no special defences. All the fortifications are earthworks. No traces of its occupation were discovered, the only relics found being a human skull and part of another found in the ditch, and some pieces of deer-horns and bones of the domestic animals, so that the origin of the earthwork and the period of its occupation have not been disclosed. The description of the skulls supplied by Dr. T. H. Bryce, F.S.A.Scot., showed that they were probably those of a man and a woman, and that the type was approximately the same as the average of modern Scottish crania.

### THE SURVEYORS' INSTITUTION.

THE annual country meeting of the Surveyors' Institution is this year to be held at Cambridge, on Thursday and Friday, May 22 and 23. On the Thursday the Mayor will receive the members at the Guildhall at 10 A.M., and deliver an address of welcome on behalf of the town. The remainder of the morning will be devoted to the reading and discussion of professional papers. At 1.30 P.M. the provincial committee will entertain the members at luncheon at the University Arms hotel. In the afternoon visits will be made to the colleges, the University buildings and Ely Cathedral. In the evening the members will dine together, and many official guests have been invited. The second day will be devoted entirely to visits and excursions to places of interest, under the guidance of members of the Cambridge, Huntingdon, Norfolk and Suffolk provincial committee of the Surveyors' Institution. These will include (1) a visit to Sandringham, by permission of His Majesty the King, who has graciously intimated his intention of entertaining the members (limited to seventy in all) at luncheon; (2) a visit to Newmarket and Cheveley Hall, by invitation of Colonel McCalmont, C.B., M.P., who will entertain the members at luncheon. The excursions will be so timed as to enable members wishing to do so to catch the evening trains for London and the West of England.

### LIVERPOOL CATHEDRAL.

AT a meeting of the executive of the Liverpool Cathedral committee held at the Liverpool Church House on Monday, Sir W. B. Forwood presided, and there were also present the Bishop, Canons Stewart, Penrhyn, Spooner and Willink, Mr. W. Bartlett, Mr. John Branner, Mr. A. Crosthwaite, Mr. A. Earle, Mr. R. A. Hampson, Mr. H. D. Horsfall, Mr. H. S. Woodcock, Mr. George Bradbury, Mr. J. Alderson Smith and the Rev. C. Harris. It was decided that two eminent architects should be invited to act as the advisers of the committee in the selection of the architects who will be invited to submit designs for the cathedral, and in the ultimate selection of the design. The names of the two gentlemen will be mentioned when their consent has been received. One of them represents the Gothic and the other the Classic school of architecture. The organisation committee's report, which was approved, stated that steps had been taken in the rural deaneries of the diocese to organise and also with the view of holding in the autumn a series of public meetings to obtain subscriptions.

The Bethesda Quarries have suffered in consequence of the strike, and the local assessment has been reduced from 24,800*l.* to 10,500*l.* Prior to the contest the annual output of slate was 96,000 tons, and 2,800 hands were employed. Now, however, only 800 men are at work, and the output is only 32,600 tons.

## PUBLIC DECORATIONS FOR THE CORONATION.

THE following letter has been sent to the Press:—

Sir,—It is to be hoped that on this exceptional occasion the opportunity will not be lost of endeavouring to raise the style of our festal decorations to something higher and more artistic than has generally been seen on similar occasions in London, and that those who are concerned in the erection of triumphal arches and other decorative trophies will think it worth while to seek the assistance of eminent artists for their design, instead of being content, as we too generally are in England, with the mere commonplaces of trade furnishers.

It is recorded in Vasari's life of Jacopo Sansovino that on the occasion of a State entry of Leo X. into Florence in 1514 the streets and principal buildings, and notably the then blank façade of the Duomo, were decorated by Sansovino and his friend Andrea del Sarto, working in collaboration, with such success as to elicit general admiration, and even induce the Pope to express a wish that the temporary façade of the Duomo had been the permanent design.

At the entry of Charles II. into London at the Restoration it is evident that some exceptional efforts were made to give architectural character to the decorative erections, for there are in the Crace collection engravings of four designs for triumphal arches to be erected in Leadenhall Street, at the Royal Exchange, in Wood Street and at Whitefriars. The original drawings of these designs are in the "Burlington-Devonshire Collection" in the library of the Royal Institute of British Architects, and, though unsigned, are evidently the work of an able hand.

Surely such precedents are worth taking to heart on the present occasion. A trophy designed by an eminent painter and sculptor, or painter and architect, or by eminent men in the three arts working together, would be likely to have a very much greater interest and a higher artistic quality than can be hoped for from decorative erections carried out on a merely commercial basis.—We are, Sir, your obedient servants,

WILLIAM EMERSON, President } The Royal Institute  
ALEXANDER GRAHAM, Hon. Secretary } of British  
W. J. LOCKE, Secretary } Architects.

Royal Institute of British Architects, 9 Conduit Street, Hanover Square, London, W.: April 15.

## CAPE TOWN CATHEDRAL MEMORIAL.

A MEETING of the general committee of the Cape Town Cathedral Memorial Fund was held on Tuesday at the War Office. Field-Marshal Lord Roberts, the chairman, presided. The object of the fund, of which the King is patron, is to erect the eastern portion of the new Cathedral at Cape Town as a memorial to those who have fallen in the war, as well as a thankoffering for those whose lives have been spared. For the memorial portion of the Cathedral a sum of at least 30,000*l.* is required.

The report of the executive committee stated that since the last meeting of the general committee on June 21, 1901, the Prince and Princess of Wales had signified their consent to become patrons of the fund. Princess Henry of Battenberg had also consented, as Governor of the Isle of Wight, to organise the local committee for the fund in the island. Lord Kitchener had accepted the post of vice-patron of the fund. The committee had arranged, in consultation with the ladies' committee, that local committees should be formed throughout the country. Cities and towns with populations of 50,000 and upward would be undertaken by the executive committee, and those with less than 50,000 by the ladies' committee. Communications were opened up with a few of the principal cities, but the replies received proved that considerable difficulty would be experienced until the end of the war, and also until the local memorials which were being generally organised had been completed. The committee therefore considered it better to postpone further action for the present. Plans were being discussed between the executive committee in England and the building committee in Cape Town, by which definite portions of the Cathedral could be allocated to the various parts of the Empire, in each of which suitable inscriptions and memorials could be placed to sons of the colony or dependency which had contributed to its erection. If this scheme could be carried out, the whole of the memorial portion of the Cathedral must then, from the bond of a common sorrow and common mercies, form one link in the unity of the Empire, and would go down to future generations as a priceless inheritance. The mode in which the names of those who had fallen or died of disease in the war should be recorded within the Cathedral was under the joint consideration of the executive and the building committees. The donations received and promised amounted to 10,805*l.* 17*s.* 6*d.*; including 2,749*l.* 1*s.* 5*d.* collected in South Africa. There was also a sum of 335*l.* which had been subscribed for special memorials

to those who had fallen and was not included in the above amounts.

Sir John Furley reported that the answers to appeals at present generally were that so much had to be done for those who were living that it was almost impossible to press this claim at the present moment. Up to the present the ladies had collected 2,965*l.* 14*s.*

General Sir F. W. Forestier-Walker said the amount at present collected might seem small. But the executive committee saw no reason to suppose that when the war was over donations would not come in and that they would not be able to get the money they required.

Lord Roberts said he quite recognised the force of the remarks made by Sir John Furley and Sir F. Forestier-Walker. In consequence of the war being so protracted many appeals for help were being made all over the country. There was a responsibility upon them all to help the wives and children and other relatives of those who were employed in the war. Whether, as one speaker had suggested, local committees would feel inclined to allocate a certain portion of their funds to the memorial at Cape Town he could not say. He fancied, however, they would desire to complete their own memorials first.

Major-General Mackinnon deprecated any attempt to appeal for further subscriptions in the City at the present time. The City people whom he had consulted on the subject had all advised him that they would "spoil their market" if they attempted it now. If, however, they waited until the conclusion of the war their appeal would probably be very generously responded to in the City. At the present moment it was useless, even with the good offices, which they had, of the Lord Mayor.

The report was then adopted.

## A NORMAN CARVING.

DURING the erection of temporary buildings inside the ruins of Llantrithyd an interesting archaeological discovery was made. It became necessary to remove a portion of a mound of earth. The workpeople engaged found their spades coming into contact with a hard substance, which further excavation proved to be a carved stone. The soil was carefully removed on all sides, and a round block of stone which would appear at one time to have been the base of a pillar or cross, was revealed. It is about two feet in height and three feet in diameter. Its upper side has a square hole in it, such as is to be seen in the shaftless bases of many of the Glamorganshire churchyard crosses. But the interesting feature about it is that all round its sides it is finely carved. It is evident that the work is of Norman date. The carving represents arcading, the arches of which are Norman in style. Each arch is separated by a slender pillar, of which the base appears to be plain, while the capital of every alternate pillar is fluted. The style is different from anything to be found in any church in the Vale of Glamorgan, and the vicar of Llantrithyd inclines to the belief that it once formed the base for a pillar or statue in one of the rooms at Llantrithyd Place. Its appearance, on the other hand, is suggestive of ecclesiastical architecture, and it is hardly likely that the Normans who settled in South Wales ever had sufficient leisure from wars with the native Celts to spend much time upon the adornment of their homes. There are in Llantrithyd Church traces of Norman handiwork, and it is possible that at one time this carved base had place there.

## WESTMINSTER ABBEY AND THE OFFICE OF WORKS.

THE following letter from Canon Armitage Robinson has appeared in the *Times*:—It is due to your readers that some assurance should be given them that the fears expressed by your correspondent "E. H. W." as to the safety of the fabric and monuments of Westminster Abbey during the preparation for the coming Coronation are groundless.

It was my privilege to be present when His Majesty the King was shown by Lord Esher the details of the suggested arrangements, and I am accordingly able to testify to His Majesty's own anxious care that nothing should be touched which could possibly be left untouched, and that consideration of convenience and seating accommodation should not be allowed to weigh against the permanent interests of the fabric. It may be safely said that the interference with the church will be less on this occasion than it has been on any similar occasion in the last two centuries.

Moreover, on the day on which the Dean and Chapter formally admitted the representatives of His Majesty's Office of Works, Lord Esher was good enough to consult me on every point that either of us could suggest in regard to pre-

tions against possible injury, and we spent nearly two hours either in the church. I may add that for many months his ship has been in communication with our architect, Mr. Ckethwaite, whose name is, I believe, a sufficient guarantee all ecclesiastical antiquarians that the interests which they concerned to defend shall be jealously watched.

It may perhaps be a further satisfaction to your readers to know that the notion that the Dean and Chapter have handed over the Abbey church to another authority is a popular illusion. As a matter of fact they were commanded by an order of the Privy Council to admit the representatives of His Majesty's Office of Works on April 1, and to close the church to the public; and at a later date—namely, after the preparations shall have been completed—to hand the keys of the church to the Earl Marshal for the purposes of the actual ceremony. This is in exact accordance with precedent; and it obviously implies that the Dean and Chapter retain the power, with it the responsibility, of watching the whole of the alterations as the permanent guardians of the building and its contents. I am convinced that on the present occasion their action in this matter will be as nearly superfluous as ever it could be; but the public may rest assured that it will be duly criticised.

### NATIONAL PORTRAIT GALLERY.

THE trustees of the National Portrait Gallery have received from Mr. G. F. Watts, R.A., a fine portrait of the late Marquis of Dufferin and Ava, which has been accepted as part of Mr. Watts's original generous gift to the nation. The trustees have also accepted a small, interesting portrait of J. M. W. Turner, R.A., painted by himself in water-colours when about sixteen years of age, which has been presented by the committee of subscribers in memory of the late Mr. W. G. Monckhouse, to whom it had belonged. Another is a small drawing in red chalks of the late Arthur Goring Thomas, the much-regretted musical composer, drawn and presented by Mr. Francis Inigo Thomas. The trustees have acquired by purchase the following portraits:—Charles Turner, mezzotint-engraver, drawn in black chalks by himself; Charles, third Earl Spencer (Viscount Althorp), drawn in black chalks by Charles Turner; Samuel William Reynolds, mezzotint-engraver and landscape-painter, painted by J. Opie, R.A.; Charles Macklin, the famous actor, painted by J. Opie, R.A.

### ARCHITECTURAL ASSOCIATION OF IRELAND.

THE annual dinner under the auspices of the Architectural Association of Ireland was held on Saturday evening at the Grosvenor Hotel.

Mr. C. J. McCarthy, city architect, presided, and the company included the following members of the Association:—

G. M. Ross, P. J. Sullivan, A. Colman Scott, H. Alberty, Bradbury, F. Hayes, M. J. Cullen, W. H. Ward, T. Coleman, J. A. Rockett, H. C. Parkinson, F. H. Tallan, F. G. Hicks, T. E. Hardiman, C. H. Mitchell, F. Shaw, Anthony Pitt, R. M. Butler, L. Baker, J. H. Webb, G. P. Sheridan and H. Pentland.

The guests of the Association included:—

Messrs. S. Hayes, W. U. Patton, Richard Turner, G. S. Turner, H. Mitchell, W. S. Davis, D. L. Rogers, T. F. Byrne, D. Pratt (U. S. Vice-Consul), G. D. Burtchell, Captain Mitty, T. J. Duncan, P. J. O'Connor, J. Rawson Carroll (vice-president Royal Institute of Architects, Ireland); Jas. P. Pile, Master Builders' Association; Geo. Coffey, W. T. Roberts, Johnson and V. Pemberton.

After dinner the Chairman gave the toast of "The King," which was cordially received.

The Chairman, again rising, proposed the toast of "Our Ancestors," coupling with it the names of Mr. J. Rawson Carroll, Pile and Mr. George Coffey.

The toast was well received.

Mr. Carroll, in reply, said he felt it a great honour to be invited to that gathering as the representative of the Institute of Architects.

Mr. Pile, speaking on behalf of the Master Builders' Association, said that that body greatly appreciated the compliment that was paid to them when they were asked to send a representative to that dinner. He referred to certain importations in the shape of architects and builders that had recently visited Dublin, and mentioned that lately three large Dublin contracts had been given to architects resident in other cities. He believed that the work could have been done as satisfactorily by men belonging to their own city.

Mr. Geo. Coffey also responded.

Mr. J. Rawson Carroll proposed the toast of the "Architectural Association." He said the senior members of the profession had every reason to be proud of the Society. The position it had attained to in such a short time was, he thought, entirely unprecedented. There were many things on which the

Association could be congratulated. They had the thorough support of the Institute of Architects. In his opinion the public were realising and understanding the position of architects now better than they had done before. Architects might, he thought, look forward to better times, and such an Association as theirs was calculated to do a great deal to improve the position of the profession. He trusted that the Association would increase in strength, and would always continue to be a worthy representative of the younger branch of the architect's profession.

The Chairman expressed thanks on behalf of the Association for the manner in which the toast had been received. He added that though the Society had been only six years in existence, it had had a very fair measure of success, and had done much for the advancement of the profession.

### THE LATE EDMUND OLDFIELD.

THE death is announced of Mr. Edmund Oldfield, M.A., F.S.A., hon. Fellow of Worcester College, Oxford. Mr. Oldfield, who was in his eighty-sixth year, was in his day, says the *Times*, a considerable authority on architecture and classical archaeology. Scholar and subsequently Fellow of Worcester College, he took a third class in classics. For many years he retained the honorary office of librarian of the college, being thus enabled to hold the only lay fellowship then permissible by its statutes. He became assistant-keeper of antiquities at the British Museum, and was associated with Sir Charles Newton in organising and developing that department. He was the author of several papers on subjects of classical archaeology, including those on the mausoleum of Halicarnassus. He was placed upon the committee for the decoration of St. Paul's, and was a strong opponent of the designs of Mr. William Burges, which were illustrated by a model exhibited at the Royal Academy. Mr. Burges, in the early sixties, had carried out in the chapel of Worcester College an elaborate scheme of decoration and colour which met with Mr. Oldfield's strong disapproval, and was quoted in the *Times* as a warning against the employment of Mr. Burges upon St. Paul's. Mr. Oldfield was at one time an active member of the Athenæum Club, serving on the committee, and was recognised as an authority of taste and knowledge in the artistic world of London. In the last year of his life by a somewhat tardy recognition he was elected an honorary Fellow of his college. Mr. Oldfield married the Hon. Susan, daughter of the fourth Baron Rivers.

### SELBY ABBEY TOWER.

THE committee appointed to deal with the state of the Selby Abbey tower having asked that the architect would prepare a report on the present condition of the tower, the following has been received from Mr. J. Oldrid Scott:—

"Since the time when my last report on the tower of Selby Abbey was written, the various defects to which I drew attention have increased, in spite of certain work which has been done in the interval to strengthen the north wall. The upper stage is in a bad condition, the cornice being almost ruinous, while the walls are badly built and in a very disjointed state. The chief mischief, however, shows itself in the north-west pier, which during the last few years has developed a considerable number of cracks, passing through its facing stones. These surface failures show clearly that the pier is carrying a greater weight than it is equal to. It is this pier which has always been most affected by the soft subsoil on which the tower is built, though it is quite possible that the one to the south-east was still more seriously affected before it gave way in the seventeenth century. Certainly of the four piers we now see that to the north-west has sunk the most, and it also carries a greater weight than any of the others, owing to the south and east walls of the tower having been reduced in thickness when they were rebuilt. It has therefore become absolutely necessary to take some steps to arrest the mischief which is in progress, and which, if allowed to proceed, would undoubtedly increase and create a very serious danger. It is therefore a great satisfaction to me that the committee appointed to insure the stability of the tower have resolved to take the course decided on, and reduce the weight of the tower by removing the upper storey. It appears that this will relieve the piers of about one-fifth of the burden they have to carry, and it can afterwards be considered what further steps shall be adopted for remedying the defects in the north-west pier which I have described. My own strong hope is that within a reasonable time it may be decided to deal with the defective foundations of the pier, as well as to remedy the weakness which has shown itself above the ground level. Whether when doing this the terrible distortion of the arches abutting on the pier from the west should be made good, as those to the east of the tower have already been, will be a subject for further consideration."

## NOTES AND COMMENTS.

As a local magazine has referred to the circumstances, there can be no irregularity in mentioning the dispute between Mr. GOLDSMITH, architect, of Manchester, and the executive committee of the proposed church of St. George in Blackpool. It appears that Mr. GOLDSMITH prepared no less than five schemes for the building. But, we presume from want of money, the committee were unable to carry out any of them. Then a sub-committee was appointed to deal with applications for return of donations and payment of accounts. Mr. GOLDSMITH's bill amounted to 315%. At one time it was said that his charges were not admitted, and afterwards that 50% should be offered to him as a full settlement. Mr. GOLDSMITH properly declined to meet the committee. Then it was stated that a member made the offer to build the church if Mr. GOLDSMITH could complete it for a sum not exceeding 10,000%. That was an offer that could not be entertained by an architect, and no reply was sent. A High Court writ was on the 8th inst. served on the parties at the suit of Mr. GOLDSMITH to recover the 315%. The claim is to be defended. Judging from what may be regarded as the official statement, we think it would be wiser for the committee to save additional expenses by paying the account in full.

THE District Railway Company cannot be considered to be in a prosperous condition, but as electricity is to supersede steam as the motive power to work the line, it was necessary to obtain a site for a generating station. In such a case there was likely to be little choice, otherwise the site selected would be generally considered as unusually costly. It was obtained, however, by the company at what appears to be a low figure. It consisted of wharf property in Chelsea Creek, with the Ashburnham Works, having a frontage to Lot's Road, Chelsea. The premises were in the occupation of Mr. WALL, the builder. As Sir EDWARD CLARKE, his counsel, stated, the area to be taken was made up of 12,965 square feet used as a wharf, and 8,850 square feet, part of the Ashburnham Works, where the claimant had for many years carried on business. Owing to the absorption of the northern side of the Thames for public improvements in recent years, there was now hardly any wharf property on the north side of the river between Blackfriars Bridge and Chelsea Bridge. Consequently, the claimant would have to remove to the south side of the river to a site which would cost about 14,000%, and new buildings and machinery would represent another 17,500%, and for disturbance of the business a further 33,500% should be added. One witness said the amount of compensation should be 70,387%. Counsel for the District Railway maintained that 23,000% would be adequate compensation. The jury viewed the premises and awarded Mr. WALL 35,000%. The amount is a lower average than is usual in such cases, for if new premises and fitting them up will cost about 31,500%, there is little remaining for disturbance.

THE ardour of the Emperor of GERMANY has been somehow imparted to other departments besides those of the Army and Navy. It is displayed no less among the officials who have charge of the publication of Greek inscriptions. For years the preparation of the work was carried on in a perfunctory way which could not benefit scholars in Germany or elsewhere. A volume which has been compiled by Herr FRANKEL with the title "Corpus Inscriptionum Græcarum Peloponnesi," is complete. It includes inscriptions from Ægina and Argonis. Another volume relating to a great many places will soon be ready. Herr OTTO KERN, who has explored a large part of the country, is the editor. The inscriptions from Paros, found three years ago by Dr. RUBENSOHNS, are also in an advanced state of reproduction. The Austrian archaeologists have been compelled by the eagerness shown in Berlin to use expedition, and it is expected that the inscriptions from Lycia will shortly be forthcoming in a volume.

It may sometimes appear heroic for local authorities to expend the money of ratepayers in law courts, especially in cases where it is assumed official rights are at stake. It

would be interesting to ascertain how much money has been wasted in efforts to determine who must pay for a sewer in Colney Hatch Lane. The work was executed so far back as 1882, and the litigation is still in progress. Judging by the spirit on both sides, it will continue until the crack of doom closes police courts and courts of appeal. The summoning was commenced by the Clerkenwell Vestry, but that body had no authority over a part of the lane in which the sewer was laid. The claims of the Vestry have been set aside in all the Courts in which they were asserted. But in spite of experience which was bought so dearly by the Finsbury Borough Council, which is the Clerkenwell Vestry in another form, has again resumed the contest by claiming in the Highgate Police Court, 31s. 1d. from one of the residents in Colney Hatch Lane. As was inevitable, the summons was dismissed, and the defendant was allowed fifteen guineas costs. One of the magistrates said that local authority had been indulging in hopeless speculation, and it might be added, hopeless litigation also. But that consists the attractiveness of the struggle.

IN 1642 Cardinal RICHELIEU founded a royal printing office in the Louvre. As in other Government establishments, such as the Gobelins, it was expected that typography would be improved in the works, and there is no question that fine examples were produced. In 1795 the office was removed from the Louvre, and in 1808 it was transferred to the mansion constructed by Cardinal ROHAN in the early part of the eighteenth century. But the building could not accommodate the large number of men sometimes amounting to 1,200, who were employed there. As a result the death-rate increased beyond that in most other works in Paris. Besides, of late years the building had fallen into such a state that a large sum was required for repairs. The French Senate has at length determined on the erection of a new building at Grenelle; it will cost about 4,000,000 francs. On the other hand, the sale of the old Palais Cardinal will recoup the outlay, and it will be no longer needful to devote a considerable amount every year for repairs. Care will be taken to preserve the works of sculpture which belonged to the Palais.

WE have already mentioned Sir THOMAS DREW's recommendation about the removal of the fractured base stones in the piers of Truro Cathedral and the replacing them by stones of a different kind. The subject was considered on Wednesday by the building committee, and was decided to defer the removal of the base stones, as was found that during nine months the cracks had not increased. Sir THOMAS DREW considered that the disaster arose from the modern specification as to mortar and bedding being observed with a precision which was quite unusual in less conscientious builders. Beds of piers in old work were usually laid in a comparatively thick bed of mortar, not too good, which lent itself to certain elasticity. At Truro the mortar was to be theoretically perfect as a cohesive cement, and the jointing theoretically perfect. The result was that the several drums of the columns became so perfectly adhesive that the pier became practically a monolith, with the attendant risk of undistributed pressure all coming on a single bed under the plinth. The provision of a damp course of asphalt added to the evil.

## The Preservation of Ancient Buildings.

ear my selection may be of too antiquated and archæol- a subject to interest the very latter-day architect, who in up-to-date styles, and who is apt to be indoctrinated he view that in architecture archæology has no proper but is merely a curb upon his rational (or irrational) nings. I approach my task with some misgiving, but if I seemed to you on your first thought to be asking your ion to only the dry bones of architecture, I shall do my o suggest to you—certainly by inference, if not directly— these are no dry bones at all, but that there lies within the of what we are about to consider many a pungent ht for each of us, and that as there is no more difficult, y and responsible branch of our many-sided calling, so is none more absorbing or interesting if approached in ue spirit, or more valuable in its object-lessons and ing.

the man of sympathy and imagination it is a real delight ch the history of an ancient building unfold itself little by to discover that the greater his learning, just so much ore will it whisper to him its secrets. True it is that knowledge and more imagination are needed to invest ranch of our craft with its full significance; equally true at imagination must not be permitted to outstrip know-

We owe much of ever fresh interest to the realisation, the centuries though it has come to us, that in every c of wrought stone or wood, almost in every brick, may be some definite history of the past, of its art or lack of it; tale of the manner of men our forbears were at any in any locality. Without this knowledge, derived from r. handiwork, history may be—has been—written awry. it, evidences derived from documents acquire a double

The two sources are mutually reflexive—taken together y become luminous. And it is part of our business as hcts to preserve this one, which is complementary to the record. It has come to be recognised all too late that preservation is a deep and difficult science, which is oined with pitfalls.

r. endeavour shall be to crystallise its somewhat indeter- ethics into a form which, I would fain hope, may be p in our practice. The lamp of memory shines brightest trimmed and lighted by John Ruskin, whose eloquent commend to all, both those who have studied it in t and perhaps put it by upon the shelf, and also our r friends who come with freshness and enthusiasm a absorbing subject. Such winged words as these will eary you in the repetition. Speaking of memory, s ("Seven Lamps," p. 178):—"It is as the centralisa- nd protectress of this sacred influence of memory t past that architecture is to be regarded by us with ost serious thought. We may live without her and sp without her, but we cannot remember without her."

ain, "If there is any joy in the thought of being remem- hereafter which can give strength to present exertion, ence to present endurance, there are two duties respect- onal architecture whose importance it is impossible to e—the first, to render the architecture of the day his- c; and the second, to preserve as its most precious ances that of past ages." Again, "We, as we live and re to be always thinking of those who are to come after at what we do may be serviceable as far as we can for them as well as for ourselves. Then, when we die, e duty of those who come after us to accept this work of th thanks and remembrance, not thrusting it aside or it down the moment they think they have no use for such only is the spirit in which we must seize ur difficult task. The semblance of any other, and, vll, any lurking suspicion of lucre, and the word may be at once that we are not fit for it. Here, then, we have

the very marrow of the subject in the words of a master of impressive language. Restoration, reparation, preservation, protection, call it what you will, this is our task and none other, to save the past for the future, to hand down intact, if may be, to posterity, what has been bequeathed to us.

Now, I have already indicated that the subject is, as the centuries go, a new one. In Ruskin's sense, in the sense in which (I hope) it appeals to us all, it was to the ancients quite unknown—except in relation to literature. As to our Mediaeval forefathers, although there are a few definite instances where ancient work was preserved, either for its sanctity, or for practical reasons, or for glorification, they were; as you all know, the most impenitent sinners. They implicitly believed—and, generally, not without good reason—in their ability at any moment to do something better than what they found, however beautiful. The eighth Henry's respect for antiquity I need not call to your mind; and yet the very destruction wrought by him and his assassins seems, through reaction, to have sown the seeds of a reverence which, fructified again by the depredations of Oliver Cromwell and his Puritans, became first a feeble sapling, but in these latter days has grown strong (I will not say quite healthy), and appeals more or less sentimentally to most men of culture and attainment. It has, in fact, become a cult, or, indeed, two cults. The one of Restoration, which, in the honest hopes of preservation or revival, has—unwittingly, no doubt, but no less ignorantly and ruthlessly—destroyed; the other of Preservation, which has, again by the force of reaction, become a fetish—a species of fanaticism—often so wanton and uncontrolled as to set men's faces against a great and good cause, at times inventive of schemes silly-seeming to the man of plain sense.

The Cambridge Camden Society did much to foster those principles of restoration which consist mainly in the would-be recovery of more ancient forms at the expense of later. Sir Gilbert Scott enunciated some wise principles in his eloquent and touching appeal for conservative restoration, and abjured the same principles steadfastly upon the many occasions when our greatest historical buildings fell into his hands—not do I think for one moment consciously or wilfully. But one of the first warnings in carrying out this fascinating work in actual practice will be to work steadfastly upon the curb. As years advance, and opportunities increase, it becomes more and more imperative to draw the rein tighter. The temptation to attempt the reconstruction of the past—restoration, instead of preservation—can grow like a fungus, as it did with Scott, and plunged a great and deserved reputation in the dust.

We may take another warning from our neighbours abroad. In France and Germany and also in Italy (although there the fortunately growing influence of Signor Commendatore Boni has helped to stay the regrettable practices in vogue), the idea that the past may be preserved by its wholesale destruction, and the reconstruction in its place of the would-be past most pleasing to the fancy of the reconstructor, and the tendency to depreciate the less in favour of the more interesting history, and to sacrifice the evidences of the one in favour of the other, have gone far to wipe off the slate the great historical buildings as such. They have in the process been largely transferred to the pages of erudite monographs, the actual buildings having become cast-iron echoes of themselves. Viollet-le-Duc deliberately sets before himself the goal of recovering the supposed form of a building at that precise period of its existence which he pedantically elects to be the most beautiful or most interesting or both. All the overlying evidences of other periods are to give way, and when those evidences sought are not found they may be manufactured in the form in which the eminent professor thinks, in his erudition, most probable and harmonious. This phase has its roots in a species of unholy pride, the refusal to acknowledge that any past century could do work as good as, or better than, the present. I can give no better illustration than the reconstruction of Leon Cathedral in Spain. The façades, our guide-book tells us with satisfaction, "have been purged of their Renaissance disfigurements." Observe the inanity of the Gothic which has taken their place, although it is fair to say that under the direction of Señor Madrazo, the architect, some clever under-building has been accomplished to the arcades and other parts which were seriously jeopardised by the great Lisbon earthquake and subsequent neglect. But there is great prodigality of new stone in all these works. The restoration of the walls of Carcassonne, upon which, under Le-Duc, the French Government has wasted untold thousands, and aided by which Le-Duc was able to lay before us, with a scholarly intuition and definiteness worthy of all praise, the history and science of Romanesque and Mediaeval fortification, forms a striking, not to say ludicrous, example of the failure of the method, even in erudite hands. The further works now in progress in which Le-Duc's methods are being carried forward are really more comical than words can express. One is indeed tempted to ask if these men are quite sane. All over Europe works of a similar kind have been during the last thirty years, and still are in active progress, and yet the modern spirit of a newly-emancipated Continent is

such that these gross misprisions of antiquity are warmly approved, and Mediæval travesties are too often regarded as glorious national monuments. If I am asked for examples, they occur in every town, almost in every village. Angoulême, with hardly an ancient stone left undisturbed; Leon largely rebuilt; Upsala a modern building; St. Mark's, Venice, externally an engineer's construction; S. Front, Périgueux, with the bottom knocked out of its remarkable history; Albi restored, and now being re-restored apparently for the sole cause that the French Government does not know what to do with its wealth; that marvellous courtyard of St. Gregorio at Valladolid, wrecked and rebuilt, and all its wondrous carvings scraped up into soapy whiteness; the delightful sculptures of Wisby being recarved because the architect (he told me so himself) thinks they are archaic and the heads too big for the bodies, and that he can draw them better, brilliant draughtsman as he undoubtedly is; Trondhjem and Stavanger new cut, Frederiksborgslot restored by a brewer like unto a public bar. And in Germany. The restorations made in Germany are more appalling than words can tell. I know not where to begin or where to stop in referring to them. I am not exempting our own country. We have suffered grievously—irrevocably—and not the least from the curious revivalist heresy that the art of architecture stopped short in the year of grace 1534. We are still suffering, but fortunately a sounder sense of proportion, which I am here to advocate to-night, the sense of preservation, is gradually making headway among us, and here and there some remnants are left to be saved almost at the eleventh hour, to show us and the future what has been wrecked under the hungry wave of restoration.

In passing I refer to one other "grim" one-man school of destructive restoration, which is fortunately individual and unique—the ignorant, conceited, self-opinionated "school" of Lord Grimthorpe. It has been as much a disgrace to the century and the Church which permitted it as to the man who directed and paid for it. Silence is perhaps most meet where memory is pain.

Parallel with this, but unfortunately on a wider plane, is the rapid destruction of ancient monuments to make way for so-called modern improvements, a process for which I venture to think our successors will curse us pretty roundly. We witnessed only lately how our County Council, priding itself on its enlightenment and supporting a committee for the registration of ancient monuments, nevertheless disgracefully destroyed one of the few remnants of the East End, that desert of modern dinginess. I refer to Tudor House, of course, which had to make way for an extra bit of asphalt. But preservation, too, has its extreme forms which, like all extremes, carry their dangers to a good cause; and in antithesis to the extreme continental practice of restoration, let us consider our own extreme cult of preservation, which carries something of fanaticism with it. But I should like to make it quite clear that I am most fully in sympathy with the primary tenets of the Society for the Protection of Ancient Buildings. No one recognises more fully the need there was for some earnest and tenacious effort to stay the work of unreasoning and ruthless restoration, which has already (always with the very best intentions) destroyed so much of the choicest beauties and deepest interests we had been fortunate enough to inherit from our predecessors. But agreeing thus heartily with the aims and tenets of the Society, I must not be held to endorse all its methods. These seem not infrequently to be directed to defeat its best objects—sometimes by exaggeration—sometimes even by childishness of statement—sometimes by the use of language seemingly calculated to annoy (the Society is an adept in the use of pinpricks), too often by carelessness or error, which come ill from those who affect infallibility of judgment. It may be said, indeed, against the Society that while it is the only organised upholder of a much-needed propaganda, it not infrequently goes far to set those who might be and would be earnest supporters against the good cause, which many of us have a right to claim as our own, with an enthusiasm as deep as the Society's most ardent member.

Now I commend the various advisory leaflets issued by the Society, with special mention of Professor Church's recent admirable excursus upon wall-paintings. They are generally sound and practical and instructive. But there will not be found very succinctly laid down the following somewhat inchoate and elusive principles which I have endeavoured to cull briefly from some examples executed and statements made by members of the Society:—(1) As a general axiom a building is to be considered as a gem, in a glass case. To touch or disturb it in any manner whatever is an act of sacrilege (a sentiment with which I, for one, heartily concur). (2) Nevertheless, you may whitewash it to any extent. You may rake out the inside of the walls and substitute blue brick for old core without stint. You may rebuild or finish an interior with blue bricks, or you may patch up cracks externally with blue bricks. (3) But you may not patch them up with the original material of which the wall is built. That is counterfeit. (4) When you come to tracery, however, you may repair that in

stone, and make such a copy of the old as you may be capable of. That, somehow, is not counterfeit. (5) You must use pin on all possible occasions. (6) And just as you may whitewash you may also use plaster. You may, indeed, "restore" ancient plaster in the fullest sense of the obnoxious word. In the eyes of the Society there is some special value in plaster as a Mediæval building material, which claims a treatment more exacting than you might accord to hewn wrought stone or timber, let us say. (7) Finally, the Society for the Protection of Ancient Buildings may advertise you for itself, or you may advertise the Society for the Protection of Ancient Buildings and yourself in the Press, or on quarterly lettered or ill-spelt tablets—if, that is, you are acting under aegis. (8) But woe betide you if you attempt anything whatsoever in any direction in connection with an old building without such imprimatur.

Here, then, I have briefly referred to the methods of the extreme schools on either side. The first is purely destructive and is fraught with disaster to the true preservation of antiquity. It has given us mainly blight and December leaves. The second is apt to destroy in its strenuous endeavour to do more wisely than restore in the extreme sense in which it might believe the first destroys. It creates in place a new method, apt to impress itself in illogical fads, as for instance when it whitewashes Exeter Guildhall, and is quite ready to have been informed, to whitewash Westminster Abbey. You must make what logic you can out of the precepts I have sketched for you above. Now I believe that wisdom lies more in the *via media*. If the tower and spire of Salisbury Cathedral were to fall to-morrow (from which catastrophe we have lately been saved by a restoration in defiance of the precept of the S. P. A. B., but against which no word of criticism was breathed), will any one say that we should do worse in rebuilding it on the old model, and all that it destroyed, its collapse? I certainly should recognise such a reconstruction as a legitimate "counterfeit." And if a whole, when also a part? It is almost impossible to deceive the future by a make-believe of the past, and if there be any fear, a record date will easily put that to right; and the better theoretical methods are understood and adopted and the old feeling expressed, the more harmonious and satisfactory will the result be. Too many windy words have been wasted over so-called "counterfeits." Do we blame the Perpendicular builders of Westminster Abbey and accuse them of counterfeit because they imitated the Early Decorated style, and in some places very cleverly? Or do we call in question Mr. Micklethwait's work, daily growing at the West End? It is, as I understand, a necessitous reproduction of ancient forms.

Now there is one skilful and many an unskilful way of treating each problem which comes before us, and there are many methods of preservation applicable only to individual instances. I can only here deal with the subject in its general aspect, and thus there are two primary principles which govern all cases:—1. In an ancient building, not a stick nor a nail shall be moved if a reason—a sufficient reason—is forthcoming to keep it where and how we find it. 2. When the work is done, no modern workman's mark shall be seen wherever it can be avoided. I do not mean to say that the condition of a building may not have been such—cumbered perhaps by restoration of fifty years ago or later—that even a transference of internal appearance may not have been a necessity, but its ancient work will all look reverently ancient, although scarred perhaps by past inroads, not by ours; and there will be nothing new inserted for newness sake, so that the feeling of antiquary on entering may feel that all is genuine and true tale, and that such as is new is legitimately, necessarily so, and such as is old untouched.

And what is the new to be? This is involved in the second question, "How far is the ancient to give way to modern requirements?" Primarily the answer is, and this must be our third principle, "It is not to give way." We can and do sometimes create *de novo* to suit modern needs. We cannot in ancient work reveal, but much more easily can we destroy. We cannot create what the past has bequeathed. That is gone and it may be gone for ever. Thus our third principle is vital one.

Nevertheless, common sense interposes and says that a building whose life, so to speak, is active must be suited to the needs of the day within reasonable bounds. But I would ask you to bear in mind steadfastly that the tendency of too much to do too much, and you will never err on the wrong side in the matter of adaptation (I am not now speaking of stultifying you too little. You cannot preserve too much).

It may be convenient at this stage, after the mention of these three guiding principles, to subdivide the buildings with which we are called upon to deal into three classes:—

1. Ancient buildings which have continued in the use for which they were erected up to the present, and which are desired to preserve for the same use. Cathedrals and churches, chiefly, detached monuments, some mansions and schools.
2. Ancient buildings which have gone out of use, but which

desired to recover to their old use or adapt to a new one incorporate into the midst of new buildings. Old manor become farms, or farms become cottages, or ancient buildings incorporated into a modern growth. ruins of ancient buildings which it is desired to preserve and to prevent from further decay.

while the same principles will govern in all divisions, practice in each will vary somewhat. In applying them let stipulate succinctly the three principles already enunciated. (1) Nothing shall be touched which can be left alone. must efface our own work. (3) Ancient work shall not be adapted to modern needs. These are primary precepts. In any case will it be possible unfortunately to fulfil out according to the measure of our success in doing so work will that work be itself successful. A fourth principle applicable to all cases has to be stated, that it goes as a matter of course. (4) Our first efforts directed to the building's stability. A fifth will perhaps be generally accepted in regard to all three divisions; (5) The beauty of an ancient building is not to be marred by modern accessories for any purpose whatever. The beauty, for instance, once made to build great brick buttresses up the west front of Peterborough Cathedral I regard as brutal, and an insult to the designers of that remarkable work. I cannot subscribe to Ruskin's precept, "Do not put the unsightliness of the aid," although I admit its tentative effectiveness. The sixth and last general principle will be (6) In all cases ivy must be removed and the building left to its own devices.

let us deal with our three classes of buildings:—(1) Buildings in active use. I confine myself for the nonce to the first class. Our third principle will be the most difficult to apply. Clearly its application will vary with individual cases, each one of which must be dealt with on its merits. I am aware of the difficulties, but would plead for the most stringent application of this principle. There are, unhappily, but few cases remaining in which modern needs have not been met by the removal of ancient evidences—very dear to us if we only now recover them. Our efforts in these latter days are often directed to restoring away the restorations of the last few years, as the late Archbishop of Canterbury once said. But we are frequently called upon to adapt, and our efforts should be directed to doing this without interfering with the original lines of the building. There are points where we may be tempted to break the rule:—(a) the levels of the floors, specially of the chancel floor; (b) the provision of vestry accommodation; (c) the disposition of the organ.

*Regarding (a) Floor Levels.*—More frequently than is generally thought the chancel was not raised above the nave, and the desire to elevate the chancel should not be permitted to disturb the original proportions of the building.

The same must be said of the frequent wish to elevate the chancel. This is specially unfortunate if there be a low-silled window. Be persistent in resisting such importunities. The level of the piscina will generally be a good guide.

*Vestries.*—Vestry accommodation is an undoubted need in these days. All I would do is to urge the finding of some space within the building which may be devoted, by screening off, to the purpose, if this be in any way possible, without committing yourself to extension. The tower space may be successfully thus utilised. But if vestries have to be added, be most careful to choose a position in which the new building will not interfere with ancient points of interest or beauty. A detached building connected by a covered passage may be better than an integral addition to the church.

*Organ Space.*—The choice of organ space is the direst problem in an ancient edifice, and demands all our care. It is confessed that the west-end position has musical advantages in its working in connection with our English method of choir in the choir stalls. There are cases in which it is impracticable, absolutely. If it can be adopted without destroying a west window, then by all means adopt it. But we are asked frequently to throw out an alternative place for the chancel, and I am bound to admit that sometimes no other possible alternative. It may be necessary to abrogate our second and third principles. But I have the matter weighed many times before taking the decision. If there are any unique features in the part of the building you would destroy refuse to do it. There is much to be said for the exercise of ingenuity in connection with the disposition of the organ, and there are really many unexplored places which courage will suggest. At Stratford-on-Avon Mr. Bodley solved the problem by placing the instrument in the western arch of the central tower. It is full of interest, certainly if ever removed the building will have suffered. Where there are transepts our difficulties may be eased, yet I know a case (at Clevedon old church) where a beautiful transept, wherein Arthur Hallam is commemorated, is absolutely ruined by a huge and blatant organ, set regardless of surroundings. To block up the chancel,

especially if it be narrow, with an instrument resting on the floor and projecting from the wall, is fatal. Even in a great church the ill effect of this treatment is patent, as in the restored abbey of Dunblane or at Boston. It must be remembered that few of our churches were built for organs, and the best we can do is a makeshift. If our difficulties be great they are diminished by having to provide for a small instrument, and perseverance and tact are all I can prescribe, together with that resoluteness in defence of the old, which will carry weight with most of those who have charge of our ancient monuments. To remove the organ from the organ-screen, where such exists, in order to open out a vista or for any practical purpose, to take down the rood-screen (and to remove it to the vicarage hall, as I have known done) in order to open out the chancel, to remove the interesting steps of a Norfolk font, because they occupied so much space, are types of deeds we mention only to deplore.

(To be concluded.)

## THE EGYPTIAN ANTIQUITIES DEPARTMENT.

IN his report on Egypt and the Soudan the Earl of Cromer writes:—

Under the able direction of M. Maspero this service can show improvement in all its branches. At the beginning of 1901 a special credit of 578E£. was granted by the Ministry of Finance, in order to enable the inspectors to travel more continuously. The results have been satisfactory, as the monuments are now under far better supervision than was formerly the case.

M. Maspero reports that he has observed a steady deterioration in certain of the older monuments, necessitating immediate repairs. This deterioration is chiefly due to the natural process of decay, but in some cases it is due to the fact of the earth covering the monuments having been removed without repairs having simultaneously been taken in hand. Amongst the monuments which have suffered thus, he instances the temples at Abydos, Luxor, Gournah and Edfou. This last is in a dangerous state, and measures are now in progress for its speedy consolidation. At the temple of Abou Simbel, M. Maspero deplors the habit of tourists of climbing on to the knees of the Colossi with a view to taking photographs. This has caused the existing cracks to widen, and he fears that large fragments will shortly fall. Repairs were undertaken upon many of the monuments, and a considerable number have now been provided with walls and gates.

The tomb of Amenhotep II. at Thebes was lately broken into by robbers, who burst the iron gate and searched the royal mummy in the hope of finding treasure. Not finding this, they contented themselves with removing the wooden boat, which was placed in the outer chamber. Fortunately the mummy suffered little harm. It seems incredible that such an entry should have been possible without the connivance of the armed guardians permanently stationed at this tomb. The matter is at present under inquiry by the police, and several persons have been arrested on suspicion.

The excavations are as usual mostly in the hands of private societies or of individuals who share their finds with the Museum Service. The Department itself carried out excavations at a cost of about 1,660E£. in 1901; 584 new objects have been added to the collection, some of them of much interest and value. The tourist fund brought in 3,213E£. in 1901, the Salle des Ventes 913E£., and the sale of "sebkah" (refuse on the sites of ancient towns and villages) 525E£. 248E£. was expended on additions to the Museum library.

At Karnak the whole of the fallen columns have been removed, and the foundations levelled and cleared. An experiment on a small scale is to be tried in the course of this year by rebuilding some of these columns upon a new and better foundation. In all 1,992E£. was spent upon repairs at Karnak in 1901. Many important statues were discovered during the excavations.

A project regulating the law for removing "sebkah" has been approved by the Government, and is now in force. Some modification in the law regulating the sale and transport of antiquities is at present under the consideration of the Government lawyers.

Good progress was made during the past year in the preparation of the catalogue of the Museum. Two volumes have been published, viz. those on Ostraca and on metal vases. Two others (on Coptic monuments and objects discovered by M. Loret at certain sites) will very shortly be published. Two more (stone vases and stelæ of Middle Egypt) are well advanced towards publication, and lastly, the proofs of three more (tombs of the Middle Empire, Græco-Roman stelæ and votive tablets) have been sent to their authors for correction.

### The Philæ Temples.

The construction of the Nile reservoir at Assouan will involve the annual submersion of a portion of the temples

situated upon the island of Philæ. This is much to be regretted, but it was unavoidable, as the Assouan cataract presented such advantages over every other site as to render its selection imperative. The Egyptian Government decided, in consequence, to take all possible steps to preserve a record of these monuments as they existed prior to the rise in the water-levels and also to lessen any danger which might arise from the annual inundation. With the first object in view, a volume, prepared by Captain Lyons, R.E., was published in 1897. It gives a full account of the temples and other structures on the island, and is furnished with photographs and detailed drawings of the buildings as they then stood.

In order to attain the second object a careful study of the foundations was made during the summer of 1901. Early in April a special staff was engaged for the purpose. Shafts were sunk alongside the foundations of the different buildings, and the nature of the soil and the depth of the rock were examined and ascertained. This work was completed, at a cost of 1,000*£*., before the arrival of the flood, and complete drawings and estimates were prepared.

After a close study of the question, and acting upon the advice of Sir Benjamin Baker, the Government decided to underpin the foundations, the method employed differing in each case according to the nature of the foundations.

Briefly, the following plan has been adopted. Wherever cross walls exist, upon which to support them, steel girders are introduced under each column and wall. These girders are then built over with masonry, and, finally, cement grout is poured in to fill up all interstices. Where girders cannot be employed, the space between the bottom of the existing foundations and the permanent saturation level is filled up with masonry, laid in cement. As the foundations of the great temple of Isis were proved by Captain Lyons to descend everywhere to the solid rock, it was decided to limit the operations to the consolidation of the following structures:—

(1) The eastern colonnade and the adjoining temples; (2) the temple of Nectanebo; (3) the western colonnade; (4) the temple of Isis Usret; (5) the kiosk, commonly known as Pharaoh's Bed.

The estimates for the above works amounted to 22,000*£*., including 3,000*£* for repairs to the superstructure. This sum has been granted by the Commissioners of the Caisse de la Dette.

In November 1901 a special staff of experts arrived and commenced work. By the end of the year the whole of the eastern colonnade had been underpinned, as also the foundations of the temple of Nectanebo. In addition to this, nearly two-thirds of the western colonnade were completed, and good progress was made with the foundations of the kiosk. The expenditure for 1901, excluding the preliminary examination, was only 1,400*£*., but this does not include the cost of materials and stores employed.

Very great credit is due to Dr. Ball and to Mr. M. Talbot for the excellent work which they have done in this connection. The task before them is extremely difficult and delicate, but so far they have been remarkably successful. Mr. Fitzmaurice, the resident engineer of the Assouan dam, was in charge both of the preliminary work and of the preparation of the estimates, and it is largely due to his energy that such satisfactory progress has been made. It is expected that the work will be entirely completed by the end of May 1902.

I have dwelt at some little length on this matter, as it has, from time to time, formed the subject of some controversy. Those responsible for the government of Egypt have been attacked from two opposite and antagonistic quarters, namely, by the engineers for paying too much attention to the artists and archaeologists, and by the latter for paying too much attention to the engineers. My own opinion is that to have deprived the people of Egypt, by reason of the artistic and archaeological objections, of the enormous and unquestionable benefits which they will derive from the construction of the Assouan dam would have been perfectly unjustifiable. On the other hand, I readily admit that all that is possible, consistent with the attainment of the main object in view, should be done to meet the wishes of those who represent the archaeological and artistic aspects of the question. This, in fact, is the course which has been adopted.

The committee charged with the preservation of Arab and Coptic monuments expended 7,300*£* last year. The expenditure was distributed over nine mosques and two tombs. A special grant of 20,000*£* was made by the Caisse de la Dette some few years ago to aid in the work of preservation and restoration. The unexpended balance of this grant now amounts to 2,565*£*., of which 700*£* for Arab and the balance of 1,865*£* for Coptic monuments. The committee propose shortly to apply to the Government for a fresh grant. Sir William Garstin writes:—"It will be observed that very little has as yet been spent of the credit of 2,000*£* allotted to the repair and preservation of Coptic monuments. There are many difficulties in the way of progress in this particular branch of the duties of the committee. The Coptic com-

munity, as a whole, and particularly the patriarch, still appear to view with disfavour any attempts of the committee to preserve these monuments, and considerable delay occurs whenever a proposal is made or an estimate submitted." The attitude of the Coptic authorities in connection with this matter is greatly to be regretted.

Before leaving this subject I may mention that an estimate is being prepared of the probable cost of restoring the important mosque of Sultan Hassan. Great care will have to be exercised in dealing with this matter.

## THE INSTITUTE OF PUBLIC HEALTH, EDINBURGH.

THE Public Health Laboratory in the University of Edinburgh was opened in 1884, and had to be extended in 1890 to provide further facilities for teaching and research in bacteriology and chemistry in connection with the diagnosis and prevention of infectious disease, but it was found that the department at the new University building was quite inadequate to supply the necessary laboratory accommodation for the chair. Sir John Usher, however, generously offered to underwrite and equip an Institute of Public Health. The University gratefully accepted this offer, and appointed a committee to look out for a site and take charge of the building and equipment. The committee appointed Messrs. Leadbetter & Fife, Edinburgh, to be the architects, and at their request, in order to insure that the new Institute should possess a most modern and approved arrangements, the architect and the professor of public health visited the great public health institutes on the Continent and in England. The results of their observations were embodied in plans which, before approval, were submitted to Dr. J. B. Russell, member of the Local Government Board of Scotland, who expressed his opinion that an institute so built would provide every facility for public health work such as was contemplated.

It was originally intended, says the *Scotsman*, that the Institute should be built on ground belonging to the University situated between the music classroom and the St. James' Union, but it was found that this site was unsuitable on account of deficient light. After consideration of various possible sites, one in Warrender Park Road was adopted. The Institute is situated on the south side of the roadway, with the principal frontage facing the north, and the amount of light available is in all respects all that could be desired, and the wideness of the streets adjoining no diminution of light can be caused by the erection of adjacent buildings.

The exterior of the building has been carried out in a simple treatment of Classic Renaissance detail, with the effect of giving a dignified elevation without any undue elaboration. It is roofed with red Roman tiles. It is rectangular in plan, and covers an area of 133 feet by 48 feet. The central part is recessed, and the main entrance is in the middle of the north elevation. On the stone lintel of the main entrance doorway three shields are being cut, one being the coat of arms of the donor (Sir John Usher), the other of the Chancellor of the University (the Right Honourable A. J. Balfour), and the third the centre will be the Scottish Lion. On the pediment high above the entrance door will be carved the arms of the University placed within an ornamental scroll. On the west front of the building there will be carved in incised letters the following inscription:—

University of Edinburgh.

The

John Usher Institute of Public Health,  
Presented to the University of Edinburgh  
by

Sir John Usher of Norton and Wells, Baronet.  
May, MDCCCII.

On the ground floor there is a spacious entrance hall, panelled with wainscot oak, an easy and well-lighted staircase, a museum, research room, gas analysis and micro-photography room, three laboratory work rooms designed for carrying on the bacteriological work in connection with the public health administration of the city, and two large and well-lighted subsidiary work rooms and caretaker's house. The first floor contains a chemical laboratory, balance room, optical room with dark room adjoining, reading room for students, veterinary analysis room, research room and cloak room, and a lecture theatre with preparation room adjoining. Under the stage of the lecture theatre are store rooms for apparatus and instruments and a mechanics' workshop. The second floor contains a bacteriological laboratory, research room, observation room, disinfection room, two incubation rooms, small lecture room for the advanced class, professor's laboratory, retiring room and library, and assistants' room. The upper storey of the central section of the building gives accommodation for the extract ventilation chambers, &c., and provision has been made upon the roof for experiments being carried

the open air. In the basement floor there are a  
ting room, an incinerating room, a room contain-  
large centrifugator with electric motor, and a room  
are air and water apparatus. A lift from the basement  
to the upper floors. The building is throughout of  
construction, the heating is by hot water, while extract  
is carried from every room, and from the various  
d fittings, in separate tubes to the extract chambers on  
where two speeds of exhaust ventilation are worked  
lectric fan. The building is lighted throughout by  
y, and electric motors are used for all appliances  
mechanical power.

nuseum is 40 feet by 25 feet, of lofty proportions, and  
ct access from the entrance hall. It is floored with  
osaic, and the cases and other fittings are made of  
mahogany. The museum is designed for educational

In three large cases will be arranged tubes con-  
bacteriological cultures of micro-organisms found in  
r, soil, &c.; also the recognised organisms of disease;  
l specimens illustrating the diseases of animals com-  
e to man; apparatus used in hygienic investigation,  
teriological, chemical and meteorological. Working  
s of filter beds and working examples of filtration of  
; samples of the means adopted for the protection of  
engaged in noxious trades, and disinfectants and the  
as used in disinfecting, &c., will also be exhibited here.

chical laboratory on the floor over the museum is of  
ze. It is fitted with three centre work-tables accom-  
eighteen workers. It has a large fume closet,  
drying chamber, a filter chamber, and the  
necessary fittings of a well-equipped laboratory.  
ork-table is supplied with cold water, pressure  
pressure air, steam, gas and electricity to the  
occupied by each worker. The pressure water  
an ingenious arrangement of pipes, is returned to the  
k for reuse. The tables also provide drawers, cup-  
writing flap and shelf accommodation for each worker;  
y fumes from the several spaces provided for the  
are immediately carried off to the exhaust chamber.

he private research rooms each give accommodation  
orkers, and are fitted with work tables arranged for  
ic, chemical and bacteriological work. The bacterio-  
laboratory, situated over the chemical laboratory and  
size, is fitted with three centre work tables for twenty-  
workers. The design and ventilation of these tables are  
those in the chemical laboratory. The special fittings  
om are a stone topped table for incubators, another  
iser, a steam jacketed filtering apparatus, a steam  
autoclave, &c.. The professor's laboratory contains a  
rk-table with all the appliances supplied to the tables  
laboratory, as well as a combustion table and other  
s. This room communicates with the advanced class-  
The lecture theatre has accommodation for 274  
at the seating being staged on the line of a catenary  
nd three sides of the room, while the rostrum, the  
screen, &c., are placed across the remaining side, with  
iving access to the preparation room. The theatre is  
well lighted, and there are arrangements for instantly  
ng the room for experiments or lantern demonstration.  
ation rooms are insulated all round, and the heating  
automatic electric hot-water boilers. The system adopted  
ld room is Hall's patent carbonic anhydride refriger-  
chine.

as analysis-room contains a centre work-table, various  
tles and fittings, and a micro-photographic apparatus  
specially constructed floor of concrete. The water  
oom has a work-table for two workers; a distilling  
a combustion table. The general plan of the building  
arrangement of the fittings exhibit the most careful  
on and research on the part of the architects, and it  
ed that the Institute will compare favourably with any  
ilding of its kind either in this country or abroad.  
rincipal contractors were:—Mason and timber, Messrs.  
lashiels; plumber and electrical work, Mr. J. M.  
uensferry Street, Edinburgh; general furnishings,  
William Patterson & Co., Queensferry Street, Edin-  
nd painters, Messrs. George Dobie & Son, George  
inburgh.

ing the Institute to the University, Sir John Usher  
st the University Court to provide accommodation for  
out scientific work in connection with the public  
ministration of the city. The importance of bacterio-  
investigation as an aid to the diagnosis of infectious  
is now generally acknowledged. In the case of  
of these diseases, especially at the beginning of an  
in a large city, cases may occur which are so slight  
e detection altogether in the absence of bacterio-  
amination, and yet these cases are able to convey the  
o others in a more virulent form. The success of  
e measures is dependent on the early notification of  
s, and bacteriological work assists greatly in securing

this end. In some cities, such as Glasgow, the corporations  
have laboratories of their own, and it was in order to  
save the city of Edinburgh the expense of erecting such  
a laboratory that Sir John Usher made the request  
above mentioned to the University Court. The com-  
mittee of the Institute, in order to fully carry out the wishes  
of Sir John Usher, set apart the three rooms above mentioned  
on the ground floor of the Institute as a bacteriological  
laboratory for the city. Two of these rooms are designed as  
laboratories, and will be specially fitted up with appropriate  
apparatus. The third room will be fitted up for clerical work.  
In this room the samples for examination will be received, the  
result of the examination recorded, and the reports of the  
results despatched to the medical officer of health or to the  
medical practitioner as the case may be. These rooms consti-  
tute a department considerably larger than the bacteriological  
laboratory of the city of Glasgow, but while these rooms are  
specially set apart for the city's work, all the special equip-  
ment of the Institute will be available for this work in case of  
need.

In 1898, shortly after Sir John Usher had announced his  
intention of giving the Institute, and his wish that it might be  
made useful to the city, the committee informally communicated  
with the late Mr. Pollard, the convener of the public health  
committee, and informed him that the committee would shortly  
submit certain proposals for the consideration of the Town  
Council. In 1899 the committee formally requested a con-  
ference with the public health committee, and laid before them  
detailed proposals. These were not entertained by the public  
health committee, but on a report to the Town Council the  
matter was remitted back to the public health committee for  
reconsideration. At the urgent request of Sir John Usher the  
committee reopened negotiations with the Town Council, and  
submitted amended proposals, which were also rejected by the  
public health committee. A fortnight ago a report was made  
to the Town Council by the public health committee, but the  
Town Council refused to adopt it, and accepted generally  
the proposals of the committee of the Institute. These pro-  
posals are, in brief, as follows:—

1. That the three rooms above mentioned be entirely set  
apart for the city's work.

2. That a qualified assistant be appointed who shall attend  
exclusively to the city's work, and that the services of an  
attendant be available.

3. That the whole work be done under the supervision of  
the professor of public health, who shall alone be responsible  
to the city for the work.

4. The scope of the work to be as follows:—

(1) Bacteriological examinations required by the medical  
officer of health in the daily work of dealing with infectious  
disease. (2) Bacteriological examinations required by the  
sanitary inspector. These would include examinations of  
water, milk, foodstuffs, flesh; also for anthrax and glanders.  
(3) Bacteriological examination of specimens in cases of  
diphtheria, typhoid fever and tubercular disease which may be  
sent by medical practitioners in the city for the purpose of  
assisting them in their diagnoses.

5. That the University agrees to perform the whole work  
for the outlay incurred. The committee estimate that for the  
investigation of 1,000 specimens the cost will be about 300/  
per annum, this being founded on the experience of cities  
where a similar arrangement prevails.

The Institute is just on the eve of completion, and will, it is  
expected, be opened in the middle of May by the Right Hon.  
A. J. Balfour, M.P.

## WORCESTERSHIRE ARCHÆOLOGICAL SOCIETY.

THE Worcestershire Archæological Society held its annual  
meeting at the Shirehall on Friday last, Lord Beauchamp  
presiding. There were also present the Rev. R. R. Duke,  
Miss Duke, Revs J. K. Floyer and Gordon H. Poole (hon. secs.)  
and H. Kingsford, Messrs. S. G. N. Spofforth, F. T. Spackman,  
F. R. Jeffrey (hon. treasurer), W. Wood, T. Duckworth and  
J. K. Randall. Apologies were received from Canon Cattley,  
Messrs. Cordy Manby, A. H. Parker and T. H. Parker.

The statement of accounts, submitted by Mr. Jeffrey, showed  
that the year was started with a balance of 54*l.* 0*s.* 7*d.* The  
total receipts amounted to 103*l.* 1*s.* 4*d.* The Society had now  
a balance of 44*l.* 14*s.* 1*d.* The fact that they drew 20*l.* from  
the deposit account of 50*l.*, partly accounted for that. Through  
the energy shown by the hon. secretaries the membership had  
increased and the funds of the Society were in a satisfactory  
condition. The Wayside Cross Restoration Fund showed  
that the Eckington Cross had been restored at a cost of  
35*l.* 10*s.* 7*d.* The sum of 3*l.* 12*s.* 11*d.* left in hand after the  
completion of the work was put to the Hanbury Cross Fund.  
That work had been completed at a cost of 25*l.* 19*s.* 11*d.*  
Mr. Jeffrey proposed the adoption of the accounts.

The Rev. J. K. Floyer, in seconding, described the financial position of the Society as very satisfactory. Of the 20% taken from the deposit account 11% was spent on a bookcase, which would increase their capital. He thought the 20% might be replaced out of the balance now in hand. For some time the Society had been working at a loss, but they had now turned the corner.

The accounts were adopted.

The annual report showed an increase of ten members, and summarised the doings of the Society during the past year.

Mr. Jeffrey proposed that the recommendation that Messrs. Porter, H. Kingsford and R. R. Duke be elected vice-presidents of the Society be adopted, and referred in terms of the highest praise to the services rendered to the Society by these three gentlemen.

Mr. Spofforth seconded, and the resolution was carried.

On the motion of the Chairman, seconded by Mr. Spackman, the Revs. J. K. Floyer and H. Gordon Poole were re-elected hon. secs., Mr. Jeffrey hon. treasurer, Mr. A. B. Pinckney librarian and Mr. Ernest Day auditor.

The executive committee were re-elected, with the omission of Mr. W. Pearce, who desired to resign, and the addition of Messrs. Spackman and Duckworth.

A letter was read from the British Archaeological Association to the effect that their Council would gladly co-operate with the Association in protesting against the sale or alteration of Hartlebury Castle.

The Chairman said it had never been proposed to alter Hartlebury Castle. It would be quite time for the Society to take action when the building was threatened in any way.

The letter was allowed to lie on the table.

It was decided to ask the Bishop of Worcester to become a patron of the Society, the Chairman hoping that the Bishop would be informed of the fact that former bishops had taken a keen interest in the Society, and had given them an opportunity of inspecting plans of proposed church restorations, which enabled them to prevent any attempt at vandalism.

The Rev. H. Kingsford said two old minute books of the Society, recording its doings fifty years ago, had been discovered.

The Rev. H. Kingsford proposed a vote of thanks to Lord Beauchamp for his excellent paper on "The Coronation."

Mr. Spackman, seconding, urged that it should be included in the Society's report.

Mr. Spofforth supported.

Earl Beauchamp said the paper did not contain original information, but simply the results of research, and he did not therefore think it worthy of being included in the Society's report.

The request was pressed, and his lordship said he would confer with Mr. Floyer on the matter.

## EDINBURGH ARCHITECTURAL ASSOCIATION.

A MEETING of the Edinburgh Architectural Association was held on the 2nd inst. in the Rooms, 117 George Street, Mr. Henry F. Kerr, A.R.I.B.A., the president, in the chair. Mr. James Bruce, W.S., submitted the following motion:—"That it be remitted to the committee of management to consider the provision made in the Scottish Universities for the teaching of architecture, and in the event of the committee being satisfied that the same is inadequate, to report whether in the opinion of the committee an application should be made to the trustees of the Carnegie Trust, with a view to more adequate provision being made for such teaching." Mr. Bruce remarked that in the University of Edinburgh there were fifty-two Professorships, but among them all there was not one devoted to architecture. In the Faculty of Law there were no fewer than seven Professorships. When they thought of the enormous importance of architecture to the health, happiness and comfort of the people, it was really a very extraordinary thing that in the University of Edinburgh there was no such thing as a Professorship of Architecture. More than that, so far as he knew, in no Scottish University was there any provision made for a Professorship of Architecture. The Carnegie Trust had just been considering the wants of the Scottish Universities. The Universities had been asked to indicate where their wants lay, and although he had gone over the statements published on behalf of the University authorities, in not one of them was there even a hint that there was any lack in the matter of the teaching of architecture. Surely that was a strange position for the Universities of Scotland to occupy. Accordingly he thought it would be well for a body such as the Edinburgh Architectural Association to directly press upon the Carnegie Trustees the advisability of something further being done in the matter of the teaching of architecture in the Universities. He used the phrase "something further," because to some slight extent the matter was attended to in the University of Edinburgh through the Chair so well occupied by Professor Baldwin Brown, namely, the Chair of Fine Art.

Mr. G. S. Aitken seconded.

The Chairman, in supporting the motion, suggested that the matter, instead of being remitted to the committee of management only, should be remitted also to the Council. He read a letter from Professor Baldwin Brown, who expressed a cordial agreement with Mr. Bruce's motion. Even though the Carnegie Trustees had too many claims before them to do anything in the matter immediately, it would be a good thing to put the demand for a Chair of Architecture in some agency of the kind, distinctly before the public. Chairman added that he had seen a good deal of what was done in the teaching of architecture both in France and America, and he was perfectly confounded with the ordinary development of the teaching of architecture in these countries. In some cases they had twenty-six or twenty-seven teachers of one kind or another in that subject alone. Why should it not bulk more largely in Scotland? The sooner they tackled the subject the better.

The motion was unanimously adopted.

Afterwards Mr. Wilson Beaton read a paper, written by Mr. James Millar, I.A., on the Glasgow International Exhibition of 1901. The paper was illustrated by drawings, photographs and limelight views.

## LOADS AND WORKING STRESSES FOR BUILDINGS.

THE committee appointed in 1899 by the Austrian Society of Engineers and Architects to report on "Specifications for the loading of structures and the working stresses of materials of construction" have published the results of ten years' labour. The following figures compiled from the report by Mr. F. C. Kunz, assistant to vice-president, engineering department, American Bridge Company, are of great interest for comparisons, says the *Engineering Record*, as they actually cover the same ground as our building laws. They are of local interest only, like data for special timber and for special stones, have been omitted. All figures are given in numbers.

### Weight of Masonry.

	Lbs. per Cubic foot
Common brick masonry, lime mortar	100-5
Common brick masonry, cement mortar	105-0
Hard brick masonry, Portland cement mortar	100-0
Best pressed brick masonry, Portland cement mortar	120-5
Hollow brick, lime mortar	80-
Porous brick, lime mortar	70-
Rubble masonry, light	12
Rubble masonry, medium	13
Rubble masonry, heavy	15
Ashlar masonry, sandstone	130-5
Ashlar masonry, limestone	125-0
Ashlar masonry, granite	16
Portland cement concrete, brick	11
Portland cement concrete, lime or sandstone	13
Portland cement concrete, granite	15

### Weight of Building Material.

	Lbs. per Cubic foot
Masonry débris	9
Sand	9
Slag	4
Coal ashes	4
Dry lime mortar	9
Dry cement mortar	10
Asphaltum	125-0
Gypsum	60-
Cinder concrete	60-
Glass	16
Dry earth	8
Wet earth	9
Gravel	12
Clay	95-1
Turf	10-

### Floor Live Loads.

	Lbs. per Square foot
Mansard rooms	3
Residences	5
Schoolrooms	6
Stairs, corridors, theatres, ballrooms, gymnasiums, armouries, assembly rooms	8
Offices, light storage, above first floor	9
Offices, light storage, first floor	11
Ice storage (ice 3 feet high)	15

### Wind and Snow Loads.

	Lbs. per Square foot
Horizontal wind pressure on vertical plane	
Snow pressure on horizontal plane	

Only horizontal wind is to be assumed. If wind and snow loads are used combined, only two-thirds of the latter is to be considered.

*Working Stresses of Portland Cement Concrete Six Months Old.*

	Sand; Gravel.				Lbs. per Square Inch.
1.	3	.	.	.	600-710
2.	3½	.	.	.	470-570
3.	4	.	.	.	340-430

*Working Stresses of Iron, Timber and Glass. In Pounds per Square Inch.*

	Tension.	Comp.	Bending.	Shear.
Cast iron and ingot iron	14,200	14,200	14,200	11,400
Steel	2,850	8,530	3,560	2,850
Timber	—	1,000	850	—
Glass	—	1,000	570	—

et holes have to be drilled. Maximum pressure on surface of rivets, 23,000 lbs. per square inch. For iron and steel bridges special instructions exist.

*The Working Stresses of Timber.*

Compression, from	.	.	.	.	1,140 to 1,420
Bending, from	.	.	.	.	850 to 1,000
Shear, from	.	.	.	.	1,140 to 1,420
Parallel to grain	.	.	.	.	140 to 210
Perpendicular to grain	.	.	.	.	280 to 420

ing and eccentric loading have to be considered (see formula given.)

*Working Stresses of Dimension Stones and Piers. In Tons per Square Foot.*

	I	IIa	IIb	IIc
Granite	100	60	50	25
Granite, hard limestone	70	40	30	—
Sandstone, medium limestone	50	30	25	—
Sandstone, soft limestone	35	20	15	—
Sandstone	15	10	—	—

es to single dimension stones, with a factor of safety 5; IIa to piers whose height does not exceed 6 to 8 times their least dimension; IIb to piers whose height does not exceed 8 to 12 times their least dimension; and IIc to piers whose height does exceed 12 times their least dimension. Stones, except granite, which are kept continually wet, these rules do not apply.

*Working Stresses for Other Masonry. In Tons per Square Foot.*

	a.	b.	c.
Common brick, lime mortar	5	7.5	10
Common brick, Roman cement mortar	7.5	5	—
Common brick, Portland cement mortar	10	7.5	5
Brick, lime mortar	4	—	—
Brick, Roman cement mortar	5	—	—
Brick, Portland cement mortar	8	—	—
Pressed rubble, Portland cement mortar	10	—	—
Brick, Portland cement mortar	12	8	6
Pressed brick, Portland cement mortar	20	15	10
Concrete for foundations:			
Common cement 1, sand and gravel 5	5	—	—
Concrete for walls:			
Common cement 1, sand and gravel 3	18	—	—
" " 1, " " 5	12	—	—
" " 1, " " 8	8	—	—
" " 1, " " 10	6	—	—

These groups a refers to walls not under 18 inches thick whose height does exceed six times their least dimension; b walls under 18 inches thick, and piers whose height does exceed six to eight times their least dimension; and c piers of at least 12 inches smallest dimension, whose height does not exceed eight to twelve times their least dimension.

*Working Stress in Masonry Arches up to 30 feet Span. In Tons per Square Foot.*

	Comp.	Tension.
Common brick, lime mortar	7	0
Common brick, Roman cement mortar	7.5	0
Common brick, Portland cement mortar	10	1
Brick, Portland cement mortar	12	1
Pressed brick, Portland cement mortar	20	—
Concrete, Portland cement 1, sand and gravel 3	18	3
Concrete, Portland cement 1, sand and gravel 5	12	2
Concrete with iron (Melan, Monier, &c., system), Portland cement 1, sand and gravel 3	21	8
Dimension stones (except soft sandstone) in Portland cement mortar	30	1

These figures are based on a mortar of 1 : 3.

missible working stress for stone stairs can be taken as 1/3 of the ultimate stress for bending.

*Pressure on Foundations. In Tons per Square Foot.*

Clay and wet sand	1.0
Ordinary clay and dry sand mixed with clay	2.0
Hard clay and sand without clay	4.0
Coarse sand and gravel	6.0

in loose, wet soil should not be stressed more than 1/2 ton per square inch of their cross-section. They should be spaced not more than 3 feet apart.

TESSERÆ.

The Art of the Portraitist.

IN portrait-painting, the value of making everything subservient to the principal object is most apparent; and this seeming neglect of detail is perfectly true to the impression given by the person depicted. In studying his character, we are almost ignorant of the accessories around him, and taste alone can guide the artist in the selection of such as will least weaken the force of the head, which, in the picture as it is in nature, should be the primary object of attraction. To attain this object, the greatest masters of the Venetian school—Rembrandt, Vandyke, Reynolds, and above all Velasquez—sacrificed those little truths which if destructive to the end in view are but as lies. What they saw and felt was merely the character of the sitter, and that they sought to render with all the force and truth in their power to give; but they wisely abstained from introducing anything which might destroy the impression they sought to convey, often blending the figures into the backgrounds, and so causing the interest of the spectator to concentrate on the face, and thence gradually decrease as the eye receded from that point of observation. And this practice is perfectly true to nature; for what we term aerial perspective affects the appearance of objects, not alone in the manner usually accepted, that is, in proportion to their direct distance from the eye, but also even laterally and perpendicularly. If you keep your eye on a man's face you will perceive that all other portions of the figure, in proportion to their distance from the head, are less obtrusive in form, in colour and in tone. What is commonly called the outline is less defined, the colour is less positive and the tone less forcible; and though the folds of drapery are apparent, the shadows are not so dark nor are the lights so brilliant as they would appear if the eye were fixed thereon. For, be it ever remembered, the force of nature solely arises from the comparative indistinctness of every object but the one immediately under observation; and though in a picture it may be almost impossible to fully carry out this great truth, yet the nearer the artist approaches it the greater will be his success.

Fuseli on Michel Angelo.

Fuseli had from his boyhood admired Michel Angelo in engravings, and he adored him now in his full and undiminished majesty. It was a story which he loved to repeat, how he lay on his back day after day, and week succeeding week, with upturned and wondering eyes, musing on the splendid ceiling of the Sistine Chapel—on the unattainable grandeur of the Florentine. He sometimes, indeed, added that such a posture of repose was necessary for a body fatigued like his with the pleasant gratifications of a luxurious city. He imagined, at all events, that he drank in as he lay the spirit of the sublime Michel, and that by studying in the Sistine he had the full advantage of the mantle of inspiration suspended visibly above him. The flighty imagination of Fuseli required a soberer master; the wings of his fancy were a little too strong sometimes for his judgment, and brought upon him the reproach of extravagance—an error so rare in British art that it almost becomes a virtue. He was no idle votary, for he strove to imitate; he was no ignorant admirer, for he thus praises his great master:—"Sublimity of conception, grandeur of form and breadth of manner are the elements of Michel Angelo's style. By these principles he selected or rejected the objects of imitation. As painter, as sculptor, as architect, he attempted—and, above any other man, succeeded—to unite magnificence of plan and endless variety of subordinate parts with the utmost simplicity and breadth. His line is uniformly grand; character and beauty were admitted only so far as they could be made subservient to grandeur; the child, the female, meanness, deformity, were by him indiscriminately stamped with grandeur. A beggar rose from his hand the patriarch of poverty; the hump of his dwarf is impressed with dignity; his women are moulds of generation; his infants teem with the man; his men are a race of giants. This is the 'Terribil via' hinted at by Agostino Caracci, though perhaps as little understood by the Bolognese as by the blindest of his Tuscan adorers, with Vasari at their head. He is the inventor of epic painting in that sublime circle of the Sistine Chapel which exhibits the origin, progress and final dispensation of Theocracy. He has personified motion in the groups of the Cartoon of Pisa; embodied sentiment in the monuments of St. Lorenzo; unravelled the features of meditation in the prophets and sibyls of the chapel of Sixtus; and in the Last Judgment, with every attitude that varies the human body, traced the master trait of every passion that sways the human heart. Though as sculptor he expresses the character of flesh more perfectly than all who came before or after him, yet he never submitted to copy an individual, Julio the Second only excepted, and in him he represented the reigning passion rather than the man. In painting, he contented himself with negative colour, and as the painter of mankind, rejected all meretricious ornament. The fabric of St. Peter, scattered into infinity of jarring parts by

Bramanti and his successors, he concentrated, suspended the cupola and to the most complex gave the air of the most simple of edifices." This character carries the image of the author's mind; the style, however, is clearer, and the expression less complicated or obscure than was common with Fuseli. No unimaginative dauber ever hid his ignorance of anatomy under a redundancy of drapery more effectually than this remarkable man could veil ordinary thoughts under colossal words.

#### Voronikhin, the Russian Architect.

In 1800 the Emperor Paul conceived the idea of building a magnificent cathedral in the "Nevskii Prospect" of St. Petersburg, to be dedicated to "Our Lady of Kazan," and Voronikhin, who was then professor at the Academy of Arts, was appointed architect. In the following year the first stone was laid by the Emperor Alexander, and the edifice was completed and solemnly consecrated in September 1811. Criticism has not been sparing of its remarks—some of them exceedingly captious—on this piece of architecture. For no other reason than because the principal façade is extended by a semicircular colonnade, it has been called a copy of St. Peter's at Rome on a reduced scale, whereas there is no one point of similarity between the two buildings in any other respect. To note but one or two trifling differences, the front of St. Peter's has no prostyle or portico, and the pediment is a mere sham one of most insignificant proportions; the colonnades again are there neither on the same scale nor of the same order as the church itself, nor are they combined with it. Andrei Nikophorovitch Voronikhin, the architect, was born in 1760, among the peasantry of Count Alexander Stroganov, who having heard of his talent for drawing sent him in 1777 to Moscow in order to be properly educated as an artist, and he there received some instruction from Bazhenov and Kazakov, two eminent architects. He was then sent to travel with his patron's son, Count Paul Stroganov and after visiting the southern provinces of Russia, Germany and Switzerland, resided for some time at Paris, diligently profiting by the opportunities there afforded of pursuing his architectural studies. In 1790 he returned to St. Petersburg, where Stroganov's protection soon brought him into notice and obtained for him employment.

#### GENERAL.

Herr Max Klinger has completed the statue of Beethoven on which he has been engaged for fifteen years. In it, as in some of his former works, he has endeavoured to suggest the difference between Christian sorrow and Pagan joyousness.

The School of Art Wood-carving, South Kensington, has been reopened after the usual Easter vacation, in rooms on the top floor of the new building of the Royal School of Art Needlework in Exhibition Road, and we are requested to state that some of the free studentships maintained by means of funds granted to the school by the Technical Education Board of the London County Council and by the Drapers' Company are vacant. The evening class has been reopened, and will meet on three evenings a week and on Saturday afternoons.

The District Councils of Llandudno and Penmaenmawr and the Conway Town Council held a conference at Llandudno Junction, at which it was decided to jointly offer a site, consisting of 80 acres of meadow land on the sloping ground above the Conway River, free to the University College of Wales.

Cardinal Vaughan laid the foundation-stone last week of a new church at Acton, London, W., which is to be erected on the site of the old priory. The nave of the new church will be 75 feet long by 31 feet wide, and the total width of nave and aisles will be 39½ feet. The style will be Romanesque; the building will be of red brick, with stone dressings and wood block floor, while the chancel will be of marble. The cost of the entire building will be about 5,000*l.* The church, which will seat 500 persons, is expected to be completed by the end of June. The architect is Mr. Edward Goldie.

The Royal Dublin Society have offered the following prizes in competition at the Art Industries Exhibition which is to be held in August next in Dublin:—Lace embroidery and designs, 110*l.*; wood-carving, 50*l.* 10*s.*; artistic metalwork, 32*l.*; artistic leatherwork, and pokerwork or pyrography, 10*l.* The rules state that each competitor must be resident in Ireland.

Excavations in Bailgate, Lincoln, have resulted in the discovery of a portion of the old city wall, consisting mainly of stones weighing three-quarters of a ton each.

The Paris Municipality will pay 95,000 francs for the installation of electric light in the Tuileries Gardens, as well as a contribution of 11,500 francs annually. But the liability of the city is not to arise until the State has arranged to bear a share in the outlay.

The Works and Streets Decorations Committee, London County Council, in conjunction with the deputation of City wards through which the Coronation procession will have resolved that the decoration of the line of route through the City should be carried out on a uniform principle of private enterprise full scope in regard to the embellishment of buildings. The decoration of the municipal buildings and the erection of costly structures of a decorative character in the streets will be carried out by the works and street decorations committee, apart from any contributions which the various wards will make towards a general scheme of ornamentation.

Mr. W. W. Astor has given 20,000*l.* for the endowment of existing undendowed professorships at University College, London, in connection with the appeal for the endowment of advanced University education and research in London.

Messrs. Martin, Wells & Co. have succeeded in their action against the Army and Navy Co-operative Society, claiming 2,900*l.* balance due. The defendants contended that they were entitled to deduct the amount as penalties for non-payment. Judgment was given for plaintiffs for the full amount of interest at 4 per cent. and costs.

Messrs. G. T. Smith & Wield have obtained the first premium in the competition for workmen's houses in Battersea and Mr. J. S. Brocklesby the second premium. The drawings will be on view next week in the Battersea Town Hall.

The Mezzotint Portraits belonging to the Royal Hibernian Academy in Dublin were sold by auction. The amounts were:—The Countess of Carlisle, by J. Watson, second prize, 45 guineas; Lady O'Brien, by J. Dixon, first prize, 155 guineas; Mrs. Musters as "Hebe," by C. H. Hodges, 26 guineas, and Lady Betty Delmé and child, by V. Green—25 guineas.

Sir W. Chandler Roberts-Austen will deliver the "J. Forrest" lecture on Wednesday next at the Institution of Mechanical Engineers. The subject selected is "Metallurgy in relation to Engineering." It will be repeated on the following Wednesday.

The Marchioness of Granby will preside at the annual dinner of the Artists' Benevolent Fund which will be held at the Galleries of the Royal Institute of Painters in Water Colours on Tuesday, April 29.

M. Loubet will take to Russia for presents a number of artistic products from the State tapestry and porcelain establishments of Beauvais, Aubusson, the Gobelins and others. These gifts are for high Russian officials and for members of the Russian Government.

Mr. H. L. Florence is the architect of the new building for the Institute of Journalists, of which the foundation-stone was laid by Sir Edward Lawson last Saturday.

The Public Baths and Washhouses which have been erected at Walham Green by the Fulham Borough Council from the designs of Mr. H. Dighton Pearson, at a cost of 62,000*l.*, have been opened. The building has been erected on a site that cost the Council 10,500*l.* to secure, and is provided with three swimming-baths, eighty-four private baths and a house containing stalls for sixty-six washers.

M. Jules Dalou, the French sculptor, died in Paris on the sixty-fourth year. He obtained a medal in the Salon of 1875. The group of the "Triumph of the Republic" was by him, as well as several other works in Paris.

Mr. J. H. Oglander has been elected president of the Hampshire Field Club and Archaeological Society.

The Tower of the cathedral of Cuenca collapsed on Sunday last. The town is about 80 miles south of Madrid and contains 8,000 inhabitants. The cathedral is large and its interior is adorned with beautiful marbles.

Paisley Abbey will be dedicated after restoration on Thursday next. The work has been in progress for about three years and has cost 20,000*l.* Increased accommodation has been obtained in the transepts.

The Loan Exhibition of some of the works of the principal English and French painters of the eighteenth century will be opened at the Guildhall Art Gallery on Monday next.

The Erechtheion is to be restored. The greater part of the famous ruin on the Acropolis is still standing, and fragments necessary for its complete reconstitution are lying around.

Mr. George Eve, of the Royal Society of Painter-Engravers, who has designed the King's invitation to the Coronation ceremony in Westminster Abbey, has designed fifty sets of the new book-plate which he has just designed for His Majesty, to be sold at eight guineas a set, for the benefit of the King Edward's Hospital Fund. These book-plates are of three sizes, the designs of each being different.

An Armenian Church will be erected as a pendant to the memorial chapel which was erected on the site in the Rue de la Goujon, Paris, where the bazaar was held which was destroyed by fire a few years ago. The architect will be M. Gliboff, who designed the chapel.

The Late Mr. Sidney Cooper's works, which were sold by auction last week, reached a total of 8,172*l.* 4*s.* 6*d.*

## EDITORIAL NOTICES.

of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our list of A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

Authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

## TENDERS, ETC.

A great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

## COMPETITIONS OPEN.

SYDNEY.—May 1.—Designs are invited from sculptors for a memorial statue of Her late Majesty in marble or bronze. Information can be obtained at the office of the Agent-General for the State of Victoria, 15 Victoria Street, West.

HARROGATE.—May 14.—Designs required for a new town hall. Premiums, 150*l.*, 100*l.* and 75*l.* Mr. F. Bagshaw, Engineer, Harrogate.

COLERAINE.—April 21.—Designs are invited for twenty-five houses for the Coleraine Urban District Council. Mr. W. Henry, clerk to the Council.

COLERAINE.—April 21.—Prizes of 20*l.* and 10*l.* respectively awarded for the first and second schemes in order of merit utilising to the best advantage a plot of ground offered by the Council for the erection of about twenty-five houses in Coleraine. Mr. William Henry, clerk, Coleraine.

KNARESBOROUGH.—June 1.—The Harrogate and Knareborough Joint Isolation Hospital Committee invite competitive designs for an infectious disease (other than smallpox) hospital at Thistle Hill, Knareborough. Premiums of 100*l.* and 50*l.* are offered for the two selected designs. Mr. J. Turner Taylor, clerk, Municipal Offices, Harrogate.

LIVERPOOL.—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

MEXBOROUGH.—May 1.—The committee of the Mexborough Montagu Hospital invite plans for the erection of an accident hospital for both sexes, for the treatment of thirty patients, with the needful nurses and servants' accommodation. Premiums of 25*l.* and 10*l.* are offered, the premium awarded to merge in the commission. Mr. C. Brumpton, secretary, Fern Villa, Mexborough, near Rotherham, Yorkshire.

SCOTLAND.—April 30.—Designs are invited for a branch library for the Anderston district, Glasgow. Sir J. D. Marwick, town clerk, Glasgow.

SUNDERLAND.—Aug. 30.—Designs are invited for proposed police and fire-brigade buildings to be erected in Gill Bridge Avenue and Dun Cow Street. Premiums of 100*l.*, 50*l.* and 25*l.* are offered for first, second and third designs respectively. Mr. Fras. M. Bowey, town clerk, Town Hall, Sunderland.

YORK.—May 1.—Designs are invited for a Memorial to the late Queen Victoria to be placed in the Guildhall, York. The design must include a representation of Her Majesty, and be accompanied by an estimate of the cost of the work complete, such cost not to exceed 1,000*l.* A prize of 50*l.* (to merge in the commission) will be given for the accepted design. Mr. W. H. Andrews, town clerk, Guildhall, York.

## CONTRACTS OPEN.

## TRADE NOTES.

THE heating of Ebenezer Wesleyan chapel, Shalesmoor, Sheffield, and also the new pianoforte warehouse and show-rooms of Messrs. W. F. Cole & Sons, Surrey Street, Sheffield, have been successfully carried out by Messrs. Alfred Grindrod & Co., heating, ventilating and drying engineers, of West Street, Sheffield, on the small-pipe high-pressure system. The same firm have also heated with improved low-pressure apparatus the new conservatories at "Brantwood," Sheffield, for Mrs. Thomas Roberts, and the offices of Messrs. Joseph Wright & Co., Norfolk Street, Sheffield.

IN the new Avenue piece, "The Little French Milliner," Messrs. Oetzmann & Co., of Hampstead Road, W., who are experts in the art of furnishing daintily and inexpensively, have provided a beautiful scene for the Tea Room Club, in which an exquisite shade of rose-hued silk predominates, while in the hero's flat there is much quaint and pretty furniture, brightened by a handsome striped green silk brocade. The two scenes are well inspired "those about to marry" with a desire to visit Oetzmann's and secure some such dainty equipments for their prospective homes.

SOME years ago a Merryweather vacuum apparatus was applied to Pokesdown, near Bournemouth, and met with great success both as regards time and labour occupied in emptying the cesspools and the abatement of nuisance caused by the old van system. Then the city of Rochester adopted this new apparatus with similar results, and now Bournemouth is just ordered an equipment. The vacuum apparatus referred to consists of an air-tight van, a strong pump and a

portable stove. In use a suction pipe of the pump is connected into the cesspool, the suction pipe of the pump is connected also to the cistern and the delivery pipe to the stove. Pumping results in a vacuum being created in the cistern as drawn up, the discharged air passing through the fire in the stove to eliminate the foul gases. There is no slop or smell, and the van, when full, can be drawn by a horse to any convenient place of discharge and emptied by simply opening a valve.

MESSRS. AUSTIN & Co., of the Newcastle Elevator Works, Newcastle-on-Tyne, have just prepared an illustrated pamphlet descriptive of their various makes of electric and hydraulic elevators. The former are so constructed that overloading (which is so damaging to this kind of elevator) is impossible, (as should the load be excessive they will repeatedly cut off the current circuit until the maximum safe load has been defined, and if the supply is turned off at any time one may easily work them by hand-power, being provided with a hand wheel for this express purpose. They are also proof against overcrowding, having not only a limit stop at the extreme ends, but also a patent automatic reserve stop in case of the ordinary ones breaking from any cause, and should the car be obstructed in descending by any means the lifting ropes would then all uncoil off the barrel and get twisted together, but to prevent this possibility these machines have a very simple appliance whereby they automatically stop themselves when any obstruction occurs; and, in case of the steel lifting ropes ever breaking, the double-safety apparatus will instantaneously arrest the car and sustain it from the guides; the greater the load the more effectual will it grip until repaired, thereby avoiding what might have been a serious accident. The hydraulic elevators are used very extensively where water pressure is available; they are divided into three classes—high, medium and low pressure. The high pressure can only be obtained by having a pump and an accumulator, which is rather costly except where there are a few machines to feed. The medium pressure, about 700 lbs. per square inch, comes next, and can be obtained at a nominal cost, there being hydraulic supply stations in most large towns. Low pressure can be obtained by placing a reservoir on the top of the building, or direct from the ordinary supply in the street. Hydraulic elevators occupy very small floor space, make very little noise, require less attention, and have fewer working parts than any other kind of elevator, and are not at all liable to get out of order where they have a medium pressure of water.

**7 PALL MALL, S.W.**

MESSRS. GLOVER & CO, wood-working machinists, Leeds, have long been favourably known as manufacturers of machines for making bundles of firewood from waste or fresh wood. Hitherto the sticks from the chopping machine had to be gathered up from the floor by hand. Messrs. Glover have, however, now succeeded in devising a gatherer which will pick up sticks from irregular heaps on the floor, and place them side by side in regular rows for bundling. As the sticks are sifted they drop into narrow spouts, which cause them to assume a uniform position lengthways, in which direction they are shot forward by rapidly moving travelling belts into narrow travelling boxes working on the top of a belt, which is about as wide as the sticks are long. By means of an ingenious arrangement of clapper the sticks are placed either perfectly straight in these boxes or else they are made to drop out, in which latter case they travel back, and accomplish the journey once more. Being compactly arranged, this stick-arranging apparatus occupies very little floor space, and as the mechanism is very simple it is readily operated, and not likely to get out of order. From the chip-arranging machine the sticks are conveyed by a travelling band to the bundling machine. They are first fed into a measuring box, from which they pass down into a cylinder, in which they are shaken by a spring and cam arrangement, and the ends levelled. Two pairs of formers now bring the collection of sticks into a cylindrical form, and whilst the bundle is held in this position the sticks are finally straightened. Although both pairs of formers act upon the sticks simultaneously, they are withdrawn alternately, so that the shapeliness of the bundle is preserved until the compressing jaws secure it. A plunger then further advances, placing the formed bundle of sticks within the compressors, and then quickly returns, so that a new charge of sticks may be placed in front of it for another bundle. Wire is next fastened round the bundle while under pressure by a wire-twisting apparatus, and, the pressure having been removed, the finished bundle is automatically pushed out of the machine by its successor. Messrs. Glover & Co. are also, as our readers are aware, the makers of the "Ideal" saw guard, of which the popularity increases, owing doubtless to the fact that it is a thoroughly and well designed arrangement for the purpose, which is now being adopted by many firms who were previously strongly prejudiced against such appliances, but who find the "Ideal" to give perfect satisfaction where other guards have been found unsatisfactory, obstructive, and in some cases even dangerous.

### THE "ONLY" STORAGE CISTERN.

WE have pleasure in drawing our readers' attention to system of water storage invented by Mr. D. Grundy, 13 King William Street, E.C., which should be widely adopted as an effective means of avoiding the contamination of the water used for domestic purposes. The principle of this invention is comprised in the fact that the cistern—a cylinder—is absolutely closed, and the water passes through it from the main to the tap without coming in any way into contact with the atmosphere. The clumsy device of the ball valve is superseded, the supply of water being regulated by a check valve placed under the cistern, which, when the latter is full, automatically shuts off the supply; while a valve of similar but reversed action, prevents the return of water into the main. This appliance, in addition to rendering contamination impossible, would obviate the discomfort and expense attendant on the breaking of pipes through frost.

### MESSRS. JEFFREY & CO.'S NEW PREMISES

MESSRS. JEFFREY & CO, for so many years established in the Essex Road, Islington, have come to the conclusion that the works, however admirably suited they may be for manufacturing purposes, are no longer conveniently situated for architects and the class of clients for whom they cater, and therefore, following the westward trend of fashion and progress, they have taken capacious premises at 31 Mortimer Street, Regent Street, where, in a handsomely appointed gallery, some 90 feet by 30 feet, they are showing *in situ* some very beautiful designs in wall-decorations. The gallery itself is hung with the latest decoration by Walter Crane, consisting of a swag frieze of fruit in bright colours on a light ground over a wall surface hung with a simple stripe of olive sprays in a delightfully quiet and at the same time rich green, the whole forming a charming background for furniture and pictures. In the gallery are also exhibited the "Lion and Dove" frieze and "Rose Bush" paper, also designed by Mr. Crane, which was exhibited in Paris in 1900, where the firm were awarded the two gold medals; and two colourings of the "Estuary" frieze, designed by Horace Warner, a very artistic frieze which has the merit of not appearing to "repeat." Here are also various examples of ceiling papers, from designs by Heywood Sumner and other artists. The entrance hall is hung

with choice examples of their finest work, including embossed leather papers, lacquered printed papers on gold ground, and silk flocks. The new "Coronation" damask, taken from one of those old Venetian designs in which the crown is made the leading feature, also forms an important part of this exhibit. The gallery will be open on Monday next, the 21st, and will contain a large display of new season's decorations and wall-papers, as well as of those which have been designed by leading architects and designers during the last thirty years, amongst which will be found specimens of the work of Owen Jones, Dr. C. Dresser, W. Burges, E. W. Godwin, Albert Moore, C. L. Eastlake, B. T. Talbert, A. F. Brophy, Kate Faulkner, W. J. Muckley, J. D. Sedding, Brightwen Binyon, H. Mackmurdo, S. Mawson, H. W. Batley, G. C. Haité, Haward, C. F. A. Voysey, and include the latest designs of Walter Crane, L. F. Day, Heywood Sumner, A. F. Vigers and Stephen Webb.

### BOMMER SPRING HINGES.

We give herewith an illustration of a new spring hinge which possesses three valuable attributes, *i.e.* simplicity, efficiency

and cheapness. This hinge is made in both single and double form, is self-acting, has adjustable tension, and is practically

indestructible. It is supplied in all sizes from 3 inches upwards, and in every variety of finish. It does not necessitate the cutting away of the woodwork of either door or jamb beyond what is required for the ordinary butt hinge, and as the spring is contained in every hinge, instead of as is customary, one hinge of a pair, the required amount of tension is secured with less strain than is usual. This hinge, which is of American origin, has been largely employed in public buildings throughout the States, and almost equally widely in Germany, where it has established an excellent reputation. It is now being placed on the English market by Mr. Walter P. Notcutt, agent for the United Kingdom, at Bristol House, Holborn Viaduct.

### ELECTRIC NOTES.

THE new electricity station of the Middleton, Lancs, Corporation was opened on Monday last. It is situated in Townley Street, and contains three engines and dynamos. The contracts for the erection and equipment of the station amount to 32,995/.

THE Elland District Council have just received intimation from the Local Government Board that they are prepared to sanction a loan of 16,000/ for the dual scheme of electric lighting and refuse destructor.

PROFESSOR THWING, of Syracuse University, has, it is said, invented a thermo-electric generator which he claims greatly reduces the cost of obtaining electric power. By the new method electricity is generated from heat more directly than by any method known at present. The new generator could be employed in electric automobiles.

THE Croydon County Council have appointed Mr. John G. Scott, burgh electrical engineer of Leith, to the office of Corporation electrical engineer, at a salary of 400/., rising to 600/. There were fifty applications. Twelve candidates were interviewed by the committee, and four came before the Council, Mr. Scott eventually being unanimously elected. He has had previous electrical engineering experience at Glasgow, Coatbridge, Bradford and Whitehaven. Mr. Scott's closest competitor for the appointment was Mr. Wilfred C. Thomson, electrical engineer to the Great Northern Railway Company.

A LOCAL Government Board inquiry was held last week at the town hall respecting the proposal of the Brighton Town

Council to borrow 45,000*l.* for establishing a municipal telephone system. The intention is to cover not only the borough, but a radius of about ten miles, Burgess Hill being reached on the north, Steyning on the west and Lewes on the east. The only opposition came from the neighbouring town of Hove, where, it was stated, the Town Council desired to retain the sole control of their roads. Replying to the Inspector, the Engineer advising the Brighton Corporation said it would much embarrass the scheme if Hove persisted in refusing permission to cross its streets, but it would not prevent it from being carried out.

### VARIETIES.

THE new church of All Saints, Weston-super-Mare, was dedicated on the 10th inst. by the Bishop of Bath and Wells.

H.R.H. PRINCE CHRISTIAN has appointed May 29 for the laying of the foundation-stone of the new municipal buildings which are to be erected in Lichfield Street, Walsall.

A BLOCK of buildings erected by a joint committee representing the whole of the Fylde Union, with the exception of Blackpool, as an infectious diseases hospital at a cost of close upon 20,000*l.*, was opened at Moss Side on Monday afternoon in the presence of a representative gathering from all parts of the Fylde. The hospital is situated on the road from Kirkham to Lytham.

A NEW Wesleyan church which has just been erected at Walsall Wood was opened last week. The building is in the modern Gothic style with terra-cotta facings and stained-glass windows. A vestibule extends the whole length of the building, and there are classrooms, vestry and orchestra. The seating capacity is nearly 400, and a peculiar feature is a sloping floor of wooden blocks. The architect is Mr. C. W. D. Joynson.

THE cross which was erected by the Dowager Duchess of Argyll on a headland at Macharoch, Argyllshire, in memory of her husband, the eighth Duke of Argyll, and which was injured by the hurricane of November 12 last, has been restored. The design of the cross is the same, but the construction has been greatly strengthened and the base is more massive. The pedestal with the inscriptions was not injured, and remains as it was.

THE reopening after restoration of Brunswick Wesleyan chapel, Leeds, took place on Sunday. The interior of the building has undergone complete renovation, and now presents

a bright and attractive appearance. The improvement is estimated to cost 2,250*l.*, which will include the practical rebuilding of the organ, a work that will be undertaken almost immediately, the contract having been let. Electric light has been installed.

THE chancel of the new church of St. Luke, which is intended to meet the religious requirements of the Burton Lane district of York, was consecrated on the 12th inst. Owing to lack of funds, the church, which is eventually to consist of a nave and a chancel, under one vaulted roof, 113 feet long by 22 feet wide, has to be built in sections, and it was the first portion—the chancel—which the Archbishop consecrated on Saturday. The estimated cost of the church is 8,000*l.*, and when complete it will accommodate 800 worshippers. The section finished consists of the vestries, chancel and aisles, which will accommodate 300, with a temporary west end, which can be taken down when the remainder of the work is proceeded with.

THE Executive of the British Fire Prevention Committee announce that Mr. Ellis Marsland, district surveyor of Camberwell, has consented to act as honorary secretary, thus supporting Mr. Edwin O. Sachs, the chairman, in respect to the testing work, which has grown far beyond what was originally anticipated. Mr. Marsland, who has been closely associated with the committee from its outset, is this year Master of the Worshipful Company of Tylers and Bricklayers. The working executive has also been strengthened by the following additional members, namely, Mr. J. W. Sheppard, North British and Mercantile Insurance Company; Mr. Langridge, A.M.Inst.E.E., Royal Insurance Company; and Mr. Hamilton, A.R.I.B.A., district surveyor for North Fulham. As to the testing arrangements of the committee for the coming session, tests are being arranged with another heavy warehouse floor with roofing by the Vulcanite Company, Ltd., with glass by the Union Plate Glass Company, Ltd., who wish to have their wired glass compared with the glazing of the Luxfer Prism Company, and Messrs. Pilkington, whose materials have already been under investigation.

THE question of vaccination in factories is one of such great importance, and the prejudice generally against vaccination is apparently so great among mechanics and labourers, that the directors of Electric Lighting Boards (British Manufacturing Company), Ltd., thought it advisable to allow every member of their staff half a crown as vaccination bonus money

ve on full pay in the event of any member of the staff unable to work owing to vaccination. Under these arrangements the entire staff of the Electric Lighting Boards' Manufacturing Company), Ltd, factory, 80 York King's Cross, some hundred hands in all, from the directors to the girls and smallest boys, were all vaccinated, and the directors thought that, owing to many difficulties in execution, the example set might judiciously be followed in factories, more particularly in the North of London, where the returns of smallpox cases have been recently very

COLLECTION of drawings, formerly belonging to Charles Kean, has recently been presented to the Victoria and Albert Museum by Mr. and Mrs. F. M. Paget, the latter being a niece of Charles Kean, and it will shortly be on view in the galleries. These drawings of theatrical scenery and costumes were executed for Charles Kean by his scenic artists W. Telbin, T. Grieve, H. Cuthbert, W. Gordon, and others, as a record of the Shakespearean and other plays produced by him at the Princess's Theatre during his career from 1851 to 1859. There will also be exhibited a full-length portrait in water-colours, by Sir William Ross, R.A., of Charles Kean as Margaret of Valois, Queen of Navarre, in "Francis I.," written by Fanny Kemble and produced at the Cent Garden Theatre in 1832.

### BUILDING AND BUILDERS.

Foundation-stone has been laid of St. John the Evangelist Church, Sandiway, in the parish of Weaverham, Northwich. The church is to cost about 5,000l.

A new post-office is to be erected in Vaughan Street, London, adjoining the Mostyn Art Gallery and close to the railway station, at a cost of about 8,000l.

The foundation-stone was laid on Saturday last by Sir William Lawson, of the Institute of Journalists. The building, which it is hoped, will in course of time become a sort of house—is at the corner of Bridewell Place and Tudor Street, Blackfriars.

The existing Roman Catholic school chapel at Rotherhithe is to be replaced by a handsome Gothic church capable of meeting the requirements of an estimated population of 5,000. Recently a start was made, when the foundations of the new edifice were prepared. The church will cost 7,000l.

THE deputation from Glasgow Corporation which visited Manchester and Liverpool to inquire into the question of Corporation dwellings have reported favourably on this class of house as managed in these cities. The ordinary tenants in Manchester include such persons as dock labourers, earning 4s. 6d. a day, but rarely working full time; a plasterer's labourer, earning 6d. an hour, also with broken time; and a cleansing department employé, with 18s. a week, but seldom earning the full wage. Some houses are kept standing empty in readiness for displaced tenants. The members of the deputation were informed that the moral effect on the tenants of living in these houses had been most satisfactory.

NEW offices are in course of erection for the Birkenhead Guardians, and the foundation-stones have recently been laid. They will have a frontage of 59 feet to Argyle Street, 176 feet to Conway Street and 100 feet to Oliver Street. Outwardly the building, which is three-storey, will have a most imposing appearance, being constructed in Ruabon red brick with terracotta dressings with Crowndundale stone. The angle at the corner of Argyle Street and Conway Street is octagonal, and at the head of the building at this point is an ornamented turret of elegant design with a dome, the roof of which will be covered with copper. The main entrance is from Argyle Street, and the entrance for relief applicants in Oliver Street. The main porch is deeply recessed, with a moulded arch of terracotta and red stone intermixed. Immediately inside the main entrance is the main staircase, at either side of which will be granite columns and arches in Crowndundale stone. Over the staircase will be a dome, through which light will be obtained for the main entrance hall. Inside the architect has certainly made the most of the space at his disposal, the various rooms having been conveniently arranged. The departments in the basement are utilised principally for storing purposes. On the ground floor are the general offices, clerks' offices, marriage-room, conference offices, relieving-rooms, doctors' rooms, dispensary, and a spacious waiting hall measuring 56 feet by 46, for the accommodation of those who are waiting to make applications for relief. The Board-room, which is 52 feet by 36, more than twice the size of the present Board-room, is on the first floor, and on the same floor are the general committee-room, assessment-room, extra committee-room, consulting-room, lavatories and cloak-rooms, a corridor being constructed in such a way as to give access to each of these rooms. On the second floor are the valuer's

private office, the vaccination office, book store and extra committee-rooms, while at the rear of this floor is the caretaker's residence. The third floor is utilised for domestic purposes. The building is fitted up on modern principles and lighted throughout by electricity. The architect for the building was Mr. Edmund Kirby, the contractor Mr. W. H. Forde, and the clerk of works Mr. W. Hughes. It is expected that the building will be completed in about twelve months' time.

### METHODS OF THE AMERICAN STONE TRADERS.

AMERICAN business methods have recently called out wide comment in other countries owing to our tremendous industrial growth, which has enabled us, says Mr. George Barnum in *Stone*, to take the foremost place among the world's producers. Intelligent critics in every land have dwelt upon the fact that we do not seem to fear competition, and so do not guard our mills and factories and our great industrial plants with the jealous secrecy that is the rule across the ocean. In all my experience in the stone business I have known only three or four proprietors of quarries or stone mills who have refused free permission to visitors to inspect the works. In every one of these cases the man who interposed an objection was a foreigner. It is worth while considering whether anything lies back of this free-handed and open-minded spirit.

I think I can best convey the lesson I have in mind by recounting a conversation I recently held with a stone producer. For various reasons I cannot give full particulars as to his business and its location. It is enough to say that he was a foreigner by birth, that he has an immense and lucrative business and that no stone of the exact kind that he produces is now sold in this immediate market. Naturally he desired to get a foothold here in New York. My conversation with him was held in the presence of a machinery maker who was endeavouring to interest him in a new stoneworking appliance. The machinery man fell to talking of the conservatism of stone men and their unwillingness to give a trial to new machinery. He mentioned incidentally that one of his practices was to install a machine in some stone-working centre without any initial expense to the stone man, provided that the other producers in the neighbourhood should be allowed to inspect its workings.

"Well, I can tell you one thing," said the quarryman; "if I install one of your machines, none of my rivals will be

allowed to see it. I do not propose to spend my good money in experimenting for the benefit of those who have entered competition with me."

"There is where I think you make a very great mistake," I replied. "That is not the American method. It is open to our entire industrial spirit, and it is worth considering whether there is not some good reason why we have never carried out a narrow spirit of rivalry in this way. Let us first take up a special case, and to do this I must ask you some very searching questions. Is your stone a good one? Is it perfectly adapted for the New York market, providing you can make price deliveries right? Are you content to let your stone speak for itself when once it has been introduced into this market? In other words, if your stone should be used in some immense striking building, would it advertise your quarries and business to lead to a further demand for this particular stone? Do you consider yourself as enterprising and as liberal as your immediate competitors?"

The quarryman was taken aback by this rapid fire of questions, but he said with justifiable warmth that his stone was the best in the world, that if it once got a foothold in the market it would push all similar stones hard, and that in the matter of price and deliveries he was sure he could meet any competition. As to his enterprise, he thought the fact that he was on the field ready to make a fight for the desired market while his rivals stayed at home and carried on a letter-writing campaign, was proof positive that he was just a little ahead of them in this matter.

"Then, in the name of all the prophets, why are you so afraid of competition?" I asked him. "This is a pretty big market, and if you had it all to yourself it would swamp you completely. To swing the business would require millions of capital. Do you not think, too, it is a pretty big task for one man to capture the entire market for himself? Your stone is not represented here at present. If you seek to introduce it, you will meet not only with criticism and bitter opposition, but with absolute indifference as well, and this is the very hardest thing to overcome. Once your stone is firmly established in the market, the obtaining of orders will be merely a matter of hustling for the share of contracts. In the long run the amount of your business in this market will be greater than if you seek to bar your rivals out completely and to fight single-handed for the entire stone."

"But," said the quarryman in a puzzled way, "grain

you are right in these particulars, how will I be served by my competitors to see what labour-saving devices I and so let them cheapen their methods of production? will keep copying after me and so may be able to get to my figures."

do not think that this fear need cause you much loss of The copyist is a hopeless distance in the rear of the tor. If you install this machine it will be months before competitors can take it up. By this time you will be to try something else, and if you keep your wits about you need be no difficulty in staying at the head of your You may ask what you would gain by having your cheapen their methods of production. In the first place tried to show you that the best chance for getting your in this market is to have all of the men who quarry it heart and soul to have it adopted by the architects and s. If by the use of improved machinery you can get it s market very much cheaper than they, then you will e single-handed fight which I have been deprecating. second place, when we give out our contracts we like ition. Let us suppose that your variety of stone is d for a big job. You can rest assured that your rivals asked to figure as well as yourself. When the bids are if there is a very great difference in the totals it will oment. Not only the other quarrymen, but also the ealers who put in bids based on their figures, will naturally that your stone is cheaper because it is inferior. The ct has no time to unravel all of these disputes, and he is o turn at once to another stone with which he is more . But, you will say, I can keep my figures up to about s of my competitors, and put in my pocket the differ- at comes from improved methods of production. The to this is simple. In any way you look at e are seeking to shut out competition in your line, without competition your stone will never get a foothold here. Look at the history of the stone e this country. The stones that have made their way ghest favour are those where competition is keenest. e, for instance, that there was just one quarry producing limestone. If it had millions of capital and facilities uring out unlimited quantities of stone, do you suppose ne would ever have come into such general use as at e? Now there are scores of strong companies, each one y in every possible way to advance the use of Indiana e. Every building that is put up in which the Bedford

stone is used is an advertisement, not alone for the quarry from which these special blocks were obtained, but for this variety of stone itself. Nowhere has there been a hotter competition. The small and unprogressive producers may have been forced to the wall, but the big and enterprising companies have had all the business they could attend to. Exactly the same case is true of the Georgia marble producers. I mention these two stones because, being centralised in certain definite localities, they naturally lend themselves to illustration. Instances from the granite and sandstone districts could also be given."

The quarryman was not quite convinced. "We have tried a number of times to form an association in our district in order to keep the prices up and to regulate the business. It has always failed. My leading competitor will not 'play fair.' He has broken all agreements and we have forced him to pay many fines."

"There is another mistake you have made," I retorted. "Why do you want any agreement? If you tie yourself up in any way like this your rivals get much of the benefit of your enterprise and hard work. Have a good understanding with them, and even enter into an association, so long as it does not propose to regulate prices or parcel out the market. I believe in associations, but only as long as they occupy themselves with their proper province. Let the association settle terms of sale, questions of credit and the like, but leave prices alone. What will build up your business is not pushing prices up, but cutting the cost of production down. This is a matter for you to settle for yourself alone. Cut off needless wastes, institute rigid economies, install the best and most improved machinery, send out of date equipment to the scrap-heap, and then welcome any honest competition. If you are worth your salt you can more than hold your end up. If you are afraid of what your rivals may do, hire a man with more push and activity than yourself to manage your business. Such men can be had, and they are cheap in the long run, no matter what salary they ask."

The quarryman mopped his brow, and asked in a very quiet tone, "Well, then, what would you advise me to do?"

"Go back to your quarries and install this machinery that you are looking at. Do not build a shed around it, and put guards at the doors to keep out visitors. Rather invite your local newspaper to write it up, so that you may get an incidental advertisement from it. If your competitors express any curiosity concerning it, ask them to call and take half a

day off to show it to them. Tell them frankly how it works, and if it saves you money say so. Let it be known that you intend to get your stone into the New York market, if possible, because you are sure there is a good field there. Take every occasion to show that you are the most widely awake and enterprising quarryman in your territory. Advertise your stone so that architects and stone men will not have to be told what it is and what its merits are when they hear it mentioned. Above all, do not try to work in the dark like a mole, even if you are getting stone out of the earth. Come out into the sunlight as if you feared no man. Show that you have perfect confidence in yourself and in your stone, and that competition has no terrors for you, as you mean always to keep just a little in advance of the procession. Then hustle—everlastingly hustle."

### HEATON NORRIS NEW COUNCIL OFFICES.

A HANDSOME pile of buildings which has been erected as a home for the Urban District Council of Heaton Norris, Cheshire, has been recently opened. The new council offices are of stone construction, having Yorkshire parpoint facings with Alderley stone dressings, the roof being covered with Tilberthwaite green slates. The design of the main façade which fronts Thornfield Road is symmetrical, in accordance with the true spirit of Renaissance architecture. This main front has a predominating projecting central portion flanked by two wings more restricted in treatment and of less altitude.

Approached by a short flight of steps flanked with sweeping balustrades on either side is the principal entrance, designed in the Doric order with a quaint freedom characteristic of Elizabethan architecture. This leads to a spacious vestibule decorated in faience, tiles and mosaics. A few steps from the vestibule give access to the ground-floor corridor, the main staircase to the first floor being central and immediately facing the principal entrance. Here again the symmetrical plans of all the three floors, viz. basement, ground and first, evince the true spirit of the Renaissance. Entered from the main corridor on the ground floor are the administrative offices. Those of the collector and surveyor are on either side of the principal entrance, and are lighted by stone-mullioned windows from the front. Communicating respectively with these, as well as directly from the corridor, are the clerk's general

and the surveyor's general offices. These are also lighted similarly from the front, and are in the flanking wings on either side of the predominating central portion of the main façade. The clerk's private office opens off the corridor and communicates also with the clerk's general. It is lighted by a large mullioned window as before from the side elevation facing Green Lane. Its more secluded position obtains for greater privacy and quiet. Also on the ground floor in the rear of the building are provided an overseer's and san inspector's offices, as well as additional rooms, available as spare offices, waiting-rooms, &c. At the end of the passages on either side of the principal stairs a telephone room and ante to the back entrance are respectively provided.

The approach to the first floor is by means of broad and easy stairs, commencing at the line of the ground-floor corridor and going up centrally in a staircase 18 feet wide. This single stair is in two flights, with a landing midway in the height, and terminates at a spacious half-landing the full width of the staircase, and at a level between the ground and first floors. From this landing to the first-floor level the approach is by double stairs against either of the staircase walls. The stairs, newels and balusters are of the massive Elizabethan style, and are in oak and pitch-pine. The staircase is well lighted by a large mullioned window glazed with leaded light of handsome design, colour being introduced in excellent taste and proper restriction.

On the first floor is a similar corridor (8 feet wide) to that on the ground floor, and directly approached from this is the council chamber occupying the entire central part of the first floor of the building. It is a room nearly 40 feet long by 20 feet wide and 16 feet in height. The ceiling is covered so as to give resonance to the voice. At either end is a handsome carved oak mantel-piece with the crest of the council on a cushion surrounded by strapwork characteristic of the style. The lower part of the walls have a wainscot dado, the upper portion being decorated in subdued harmonious tints. Opening off the council chamber, as well as directly from the corridor, are the council retiring-room and committee-room. The former occupies the entire left wing of the building from front to back, as is well lighted on three of its sides, two stone and mullicorn oriel windows occurring symmetrically on the longest side. This room is divisible into two, when desirable, by a panel folding screen. Its dimensions are:—Length, 41 feet; width, 21 feet; and height, 13 feet. The council retiring-room and committee-room are finished similarly to the council chamber.

are also two waiting-rooms, a stationery store, lavatories, at this level. The basement is approached under the stairs on ground floor; this is devoted to heating and utilitarian purposes. The rooms, however, are lofty, and well lighted, and can readily be adapted for all classes, &c.

The architects are Messrs. Woodhouse & Willoughby, who were the first premium in the limited competition held some years ago among nine competitors.

## NEWPORT AND FOREIGN COMPETITION IN THE IRON TRADE.

returns just issued by the Customs Statistical Department show some interesting particulars relating to the importation of this country of steel billets during last year from foreign sources.

The largest importer is, of course, Liverpool, which received 16,432 tons from Holland, 15,413 tons from the United States, and 2,632 tons from Belgium. Manchester received 10,800 tons from Holland, 3,171 tons from Germany and 2,912 tons from the United States. London received from Sweden 1,525 tons, from Holland 1,717 tons and from Belgium 1,525 tons, and several smaller quantities from other countries. Leeds received 8,361 tons from Germany, 648 tons from Belgium and 7,500 tons from the United States. Swansea received 1,469 tons from Germany, 4,023 tons from the United States, 2,152 tons from Sweden and 2,922 tons from Holland. With the exception of Liverpool, by far the largest importer (in former years) in the whole of the United Kingdom is Newport, which received 6,308 tons from the United States, 4,404 tons from Belgium and 13,811 tons from Holland, being a total of 30,813 tons, which, compared with the importations of Newport of 27,008 tons in 1900, shows an increase of 3,805 tons. This large growth, as far as Newport is concerned, is undoubtedly due to the local demand for the manufacture of iron and galvanised sheets, tinplates, wire and nail rods, and for similar articles, and with the establishment here of the new works of Messrs. John Lysaght, Ltd., Messrs. W. & A. Musker, Ltd., and other cognate industries for which Newport offers the advantages of cheaper coal and deep-water wharves with direct over-sea carriage, there is every prospect of its still more largely developing in this trade, and especially in the cheap coal-shipping charges and ocean lines of

steamers now running from Newport to the River Plate, Africa, China, Japan, Brazils and India.

## THE NEW GREENWICH UNION WORKHOUSE.

THE new workhouse in Grove Park, Kent, formally taken over by the Guardians by the chairman of the building committee, Mr. J. P. Lewis, on the 9th inst., was decided to be built on the site at Grove Park, in February 1896, a previous scheme, considered as long ago as November 1887, for providing additional accommodation by extension of the present workhouse buildings at East Greenwich, having been vetoed by the Local Government Board, on the ground that the present East Greenwich site was already congested.

The site of the new workhouse, the total area of which is 10 acres, the level at the entrance being 120 feet above Ordnance datum, was purchased in August 1896 at 400l. an acre.

The plans of the new buildings were prepared by the Board's architect, Mr. Thomas Dinwiddy, F.R.I.B.A., F.S.I., assisted by his son, Mr. T. Norman Dinwiddy, A.R.I.B.A. After approval of the plans by the Local Government Board, tenders were advertised for, and that of Mr. T. Rowbotham, at 175,020l., was accepted. Mr. Dinwiddy first became architect to the Greenwich Guardians in 1882, in an open competition for the infirmary extension, his designs being then chosen out of twenty-three submitted by the final selection of the Local Government Board.

On June 15, 1899, the foundation-stone was laid by Mr. John Anderson, the then chairman of the Board of Guardians.

The accommodation provides for 256 aged and six infirm males, 172 aged and six infirm females, 200 able-bodied males and 100 able-bodied females, and there is, in addition, a pavilion for twelve old married couples, making with the receiving wards and a small isolation ward a total provision for 816 inmates; the accommodation for the male inmates is on the left (north) of the site, and the female on the right (south).

At the entrance from Marvels Lane are placed on the left the porter's lodge, and on the opposite side waiting and visiting rooms, with the male and female receiving wards (complete with bath, search-rooms, &c.), and on either side stores for inmates' clothes and effects. To the left, again, are the disinfecting chamber and mortuary, fitted with post-mortem table

and appliances, also stabling for four horses, with residence over for coachman.

The administrative block, with its main elevation fronting Marvels Lane, is centrally placed, and approachable from all parts of the institution. On the left, near the entrance, are the master's offices, with waiting-room, and, adjoining, the committee-room, with small ante-room. A surgery is provided. On the right of the entrance are the master and matron's apartments, with matron's office, linen and serving rooms adjoining. Following to the left and right respectively, are stores fitted for males and females' clothes and washed linen, and between a spacious general store approached from the male and female sides, with a gallery round three sides, top lighted, and fitted for the dry goods and grocery provisions for the institution; the goods entrance is through a square courtyard overlooked from the master's office. In the rear section of the administrative block are placed the aged and able-bodied inmates' dining-halls, divided for the sexes by movable partitions, and so planned as to be capable of extension to provide additional accommodation without material alteration. The kitchen and scullery (centrally planned with serving hatches into each section of the dining-halls), are fitted with steam and gas-cooking appliances, and meat store, bread-room, larders and pantries are situate on either side, within easy access. The male and female officers' mess-rooms are to the left and right of the aged dining-hall. The nurses' quarters and accommodation for assistant master and other officers are situate on the first floor.

The pavilions, accommodating the male and female aged and able-bodied inmates, as above, are grouped to the left and right of the administrative block, the pavilions for able-bodied being in the rear; all are connected with the administrative building by covered corridors, with open arched sides, beneath being subways for steam and water-mains and electric cables. The numbers in each pavilion vary from 80 to 100.

The dormitories, arranged for two rows of beds, allowing the most effective cross ventilation, in place of the old system of four rows of beds with a central partition, occupy the first and second floors, and the day rooms, with attendant's room and small scullery, the ground floor. Special attention has been given to lighting and ventilation, and the rooms are of varying sizes to admit of classification. Bathrooms and lavatories are placed in annexes, disconnected from the main buildings by ventilated lobbies. In the pavilion for married couples there are separate bedrooms and a common dayroom,

with small scullery and larder. External fire-escape balconies and staircases are provided to all the pavilions.

The chapel, which has seating for 400, is centrally placed, connected to the main corridors, and within easy reach from the pavilions. The laundry block contains the receiving-room, spacious washhouse with separate small washhouses for female and officers' linen, drying and ironing rooms and delivery room the machinery being driven by steam power. In the engine room are two electrical engines, each driving a 50-k w. dynamo, a well with engine alternatively coupled to a spare 25-k dynamo, and a vertical engine driving the laundry machinery. There is a battery of electrical accumulators capable of maintaining 200 lamps for 10 hours. There are three ovens in the bakery, of capacity sufficient for the requirements of the institution, with bread-room attached. The flour store is situated over, in the water-tower, on which is a cold-water storage tank of 24,000 gallons capacity. There are four Lancashire boilers placed below the ironing-room, with coal vaults and a well, and ventilated stokery. The isolation ward provides two wards for two beds each, with nurses' room, &c. Workshop with hand corn-grinding mills, are situate near the able-bodied males' pavilions. There are small workshops placed near the aged males' pavilions for use by the aged inmates.

The buildings are all heated by hot water, in addition to subsidiary open firegrates.

The whole of the institution is lighted by electricity.

The engineering work has been carried out by Messrs. Moorwood, Sons & Co., Ltd., of Sheffield and London; the electric lighting by Messrs. H. F. Joel & Co., of South Molton Street, W., and the well by Messrs. T. Tilley & Sons, of Commercial Road, E.

The question between the Guardians and the Local Government Board, which has been the subject of wide reference in the press, is apart from the fitness of the buildings for their purpose. This is testified by the fact that the Local Government Board selected the designs of these buildings for illustration at the Paris Exhibition as a perfect type of such an institution. The resulting agitation in the press, however charging the Guardians with providing palatial accommodation, conveys a reflection on all concerned in the building, and calls for correction. The following are some extracts from eight leading journals:—"Mosaic flooring, beautiful panelling, a dining-hall fit for royalty and a church which any rector would envy." "The awe inspiring entrance is worthy of Kensington Palace, which certainly does infinite credit to the

ect." "Fitted up with the utmost luxury." "Neat little  
aries, which any undergraduate at Oxford would be only  
lad to have." "The spacious courtyards are worthy  
a Mediaeval monastery." "Suited for the English home  
American millionaire." "New paupers' palace at  
"A handsome series of structures." The most  
cal reply to these criticisms is that the total site and  
ing cost, including the addition for well and electric  
hig (beyond which there have been practically no extras)  
cuts to 237% per inmate, which is rather under than over  
ost of parallel institutions in the Metropolis of modern  
te A neighbouring workhouse of contemporary date and  
extent, where there is no suggestion of excessive outlay,  
57% per inmate; moreover, in our Greenwich example,  
ministrative quarters have been provided of extent suffi-  
to cope with future pavilions for possible extension to  
a further 200 inmates; besides the margin in kitchen  
undry, this has involved an additional floor on the central  
ilings for staff, which will for the time be in reserve. The  
wich contract has also comprised an unusually complete  
ion of seating, store-room fittings, &c., often dealt with  
tl subsequent furnishing.

# INSTITUTION OF JUNIOR ENGINEERS.

meeting of this Institution held at the Westminster  
Hotel on April 11, the chairman, Mr. Percival Marshall,  
esing, the paper read was entitled "Notes on Modern  
house Construction," by Mr G. Drysdale Sweetman, of

illustrate the evolution of structural design, the four  
econs on the Eddystone were briefly examined, and their  
ie points of difference indicated as follows:—The base of  
in anley's tower (1695) was built of stone strengthened with  
on ands; its sides were vertical and were encumbered with a  
of ion of unnecessary and even dangerously obstructive  
ment. It was in the form of an octagon and 100 feet high.  
esayed by a storm in 1703. Rudyerd's tower (1705) was  
il of wood ballasted with stone; its plan was circular and the  
wildy ornament was omitted. In section it was a frustum of  
cd, 23 feet in diameter at the base and 14 feet at the top,  
d out 67 feet high. The foundation rock was levelled off  
s and the tower united to it by means of bolts keyed into  
ock. It was destroyed by fire in 1755. Smeaton's  
c structure was finished in 1759. The material was

stone, and for external form the trunk of an oak tree was  
chosen. The base was thus considerably broadened and the  
waist narrowed in comparison with Rudyerd's tower. The  
masonry was bonded together and into the rock by an elaborate  
system of dovetailing. It was 76½ feet high, and was partially  
removed in 1882 owing to the concussive erosion of the bed-  
rock which threatened its stability. Douglass's new Eddystone  
was built of granite, and differed from the last named in having  
a cylindrical base with vertical sides carried 2½ feet above high-  
water mark. The tower, which was a concave elliptic frustum,  
started from the top of this vertical plinth. The total height  
from foundation to vane was 170 feet. The walls were 8 feet  
6 inches thick at the base and 2 feet 3 inches at the top. The  
tower was solid to a height of 25 feet 6 inches above high  
water.

In some experiments on wave power, made at the Skerry-  
vore and at the Bell Rock by Thomas Stevenson, so great  
forces as 6,083 lbs. per foot at the former and 3,013 lbs. at the  
latter station had been recorded; with these stupendous forces  
to combat, it behoved the designer to appreciate every minute  
detail of the disturbing elements and to endeavour to neutralise  
their action.

By spreading out the base, not only was a broader founda-  
tion area obtained and the centre of gravity lowered, but also  
the force centre of each wave stroke was raised by the  
momentum of its impact, and a portion of its violence dissipa-  
ted in overcoming the force of gravity. There was a limit,  
however, to this base spreading policy set by the tendency of  
the wave crests and spray to rise so as to obscure the lantern,  
and it was partly to obviate this difficulty that the late Sir  
James Douglass designed the new Eddystone with a cylindrical  
base.

The generally accepted shape for a lighthouse in plan was  
circular, but the suggestion was offered that with a polygonal  
plan of many sides but little more obstruction would be made  
to the waves, and instead of swirling round as in the case of a  
circular tower, the waves would be made to take a rather  
divergent course and so offer a leeside for landing purposes.  
The foundation courses should in all cases be sunk below the  
surface of the rock, for though the stability of the structure  
depended for the most part on its weight and the low position of  
its centre of gravity, the idea was to make the tower virtually  
a projection of the rock itself.

It was important that the pressure of all the materials and  
structural units within the tower acted vertically, so as not to

produce a resolved force operating laterally as an outward thrust. Care should be taken to so locate the openings in the tower as to afford them the greatest protection. It was interesting to note that the presence of seaweed was of great advantage in breaking the force of waves. The internal accommodation usually comprised the service-room, which contained the lantern, attendants' room, bedroom, general stores, oil stores or (as the case might be) gas store, dynamo-room, &c. A water-tank low down in the base and a crane were also necessary.

The author, in referring to materials of construction, pointed out that, although skeleton towers were often easier to erect than were masonry ones, owing to the difficulty of devising a safe landing-stage during rough weather, and also to the impossibility of fixing any floor below the highest probable wave crest, accommodation was greatly hampered if a very high tower were not otherwise necessary. For masonry structures the granites, syenites and porphyries were the most useful stones. In some situations the use of concrete had much to recommend it, and if only the difficulties of cracking could be obviated there was no doubt but that the material would be more largely used. Besides the popular theory of expansion and contraction, the possibility of some sudden chemical change in the later portions of the settling process producing a disruptive molecular disturbance, or perhaps of the mass being in itself in such a state of initial tension or compression that it was sensitive to æthereal or seismic tremors which would not affect a more resilient material, were advanced to account for the cracking of mass concrete.

The invention of the Argand burner (1870) marked the commencement of the concentrative systems which, starting with oil, had probably reached their maximum intrinsic brightness in the electric arc. The Trinity House oil burners were generally of the five or six concentric wick type, with intervening air spaces, the outer diameter of a six-wick lamp being  $4\frac{3}{4}$  inches. A great number of wicks was sometimes used, but the heat from them was enormous. A seven-wick lamp consumed about a gallon of oil per hour. The oil in the lamps was supplied under pressure by gravitation, air or hydrostatic head, or by clockwork pumps. The introduction of incandescent mantle burners had given a fresh impetus to oil illumination. The two principal systems were the oil gas and the petroleum vapour. In the former the oil was vapourised at a shore station, and the gas compressed to ten or twelve atmospheres; the burning pressure was usually 2 to 3 lbs. per

square inch; the consumption 1-16 cubic foot per unit candle of flame intensity at one atmosphere.

From the fact that, among others, the French fifth or occulting light at St. Nazaire was left unattended during the night, the system seemed quite reliable. The apparatus consumed about 800 $\frac{1}{2}$ . In the petroleum vapour system the oil, under a pressure of from two to three atmospheres, was forced through a vapouriser which was heated by the burner itself at lighting; the consumption was about 8 grs. per unit candle. This system was not so easy to work as was the oil gas, but required less apparatus. The electric light had many advantages, and except in a few cases, could not be said to warrant the increased expenditure over other methods. Its glare made it very unpopular with mariners, and it was also deficient in penetrative power through fog, owing to its containing so large a quantity of highly refrangible rays. The proportionate reduction in a thick fog was four times greater than gas. Oil and gas were about equally affected by atmospheric condition. In fine weather the present arrangements were quite sufficient, but at the first sign of mist they were practically useless, and it was in this direction that future improvement must be looked for. The extensive use of coloured lights was impossible owing to the great absorption of light in passing through the screens. Taking white light of unit intensity, red was one-third, green one-fifth and blue one-seventh. Red was therefore the only permissible colour from an economic point of view; it also possessed the advantage of being less easily absorbed than white light in foggy weather. The introduction in 1890 by the late M. Bourdelles of the mercury float mechanism was a great point of progress, and it, in the feu éclair or lightning-flash system, a far more powerful beam and quicker flash was made possible by the faster rotation of a less extensive lens field.

The conclusion of the paper was devoted to the consideration of optical arrangements. The great superiority of the dioptric and catadioptric glass lens over the older catoptric metal reflector system was an established fact, and it was not possible to totally reflect or refract nearly every ray issuing from the source of illumination into a useful path.

A discussion followed the reading of the paper, and a vote of thanks was accorded the author. After his reply, the proceedings closed with the announcement of the ensuing meeting on May 2, when a paper would be read by the hon. librarian, Mr. Lewis H. Rugg, on "Some Factors in Colonial Railway Construction."

## THE WEEK.

A fire which has occurred in Barbican has caused surprise among experts than would be expected in a disaster which affects in different degrees about fifty structures. As in the case of Cripplegate in 1897, the roofs of the buildings formed hives in which rooms of various sizes were packed with objects that not only easily burned, but helped to extend the progress of the flames. Among the businesses carried on were wood-working, millinery, match-making, furniture, artificial flowers, games, &c. It will be apparent that the goods stored in the houses were extremely dangerous from a fireman's point of view. It is admitted that the brigade worked with their accustomed energy, and there was no lack of water. It is easy for amateur judges to assert that the buildings were of clumsy construction, but they appear to have been substantial as could be expected under the circumstances. High rents are not to be obtained in such a quarter, and the returns to the building-owners, therefore, are not excessive. Whether it is wise to allow a series of the kind to be congregated within a limited area may be doubted, but authorities have to deal with the situation as it is, not with a Utopian city. Business creates its own quarters, and it is usually bad policy to interfere with it. When the traffic in the streets of the Metropolis is properly arranged, it will be time enough to talk about "This manufacturer shall sell in such a spot and no other of a similar kind within a prescribed distance." However may be the amount of the loss it must be repaired, but when all circumstances are taken into account the loss in such a district must be accepted as among the inconveniences which are inevitable in such a city as London and under existing conditions.

THE report which was presented at the annual meeting of the Liverpool Architectural Society announces that the society has been incorporated by the Board of Trade, and the word incorporated will have to be added to the title. The Council made an effort to have the word omitted, but the Board of Trade was firm. Several of the members, whose interest in the Society has for some time been dormant, regarded the incorporation as an opportunity to resign. The membership has therefore greatly decreased. The fellows, associates and students numbered respectively fifty-two, forty-seven and twenty-six, against fifty-five, fifty-three and twenty last year. The ordinary membership stands at fifteen, making a total of 140. The Council protested against the selection of St. James's as a site for the proposed Liverpool Cathedral, but the choice was ratified at a public meeting, they failed to oppose what was evidently the wish of the majority of those outside the profession. The charges connected with the incorporation amounted to 43*l.* 6*s.* 6*d.*, and the Cathedral competition 12*l.* 16*s.* 8*d.* At the beginning of the year the balance was 185*l.* 19*s.* 0½*d.*, and at the close of the year 130*l.* 14*s.* 8½*d.* The annual subscriptions amount to 2*l.* 5*s.* 6*d.* The Manchester Society of Architects report that the aggregate membership is 193, viz. ninety-two fellows, fifty-two associates and forty-nine students, as against a membership of 182 at the date of the last report, an increase of eleven. The subscriptions received during the year made a total of 160*l.* 3*s.*, but the expenses were in excess of income to the extent of 31*l.* 7*s.* Since the last annual report of the Northern Architectural Association four members, three associates and twenty students have been elected, as compared with one member, two associates and twelve students in the previous twelve months, and the roll now stands as follows:—Members, twenty-seven; associates, seventy-four; students, eighty. At the Council meeting held on December 27, 1901, it was resolved that the following note be issued to members:—There appears to have been some recent misunderstanding as to the correct charges for quantities, the Council of this Association wish to place on record

that the understood charge is from a minimum of 1½ to a maximum of 2½ per cent., exclusive of lithographing or copying." The subscriptions amounted to 114*l.* 4*s.* 6*d.* The expenditure did not exceed income; for at the beginning of the year the balance was 89*l.* 4*s.* 6*d.*, and at the end of 1901 88*l.* 19*s.* 9*d.*, an insignificant difference. In the Glasgow Institute of Architects there are seventy-two members, the same number as last year, including nearly all within the district of the necessary standing and qualifications. The income was 63*l.* 1*s.*, and the expenditure 52*l.* 7*s.* 3*d.* The capital account was reduced by 63*l.* 2*s.* 8*d.* for expenses connected with the visit of the R.I.B.A. to Glasgow.

AMONG the men who are entitled to be honoured in France is M. MARCEL DIEULAFOY. By the explorations which he carried out in Susa with the aid of his wife he gave a revelation of the use which was made of tiles or glazed bricks in Persia, and in that way enabled the history of ceramics to be more completely written. We have lately commented on the discourtesy shown to M. DIEULAFOY when it was proposed to introduce objects found in Persia at a later period into the room containing his famous frieze, without consulting him as to whether the intrusion would not be injurious to the decoration. A more marked instance of official sentiment towards him was displayed a few days ago. M. DIEULAFOY is a candidate for election as Deputy at Villefranche, and he already holds the position of Councillor of the Haute-Garonne; he is also one of the engineers-in-chief of the department of Ponts et Chaussées. It appears he attended a meeting of the electors without obtaining authority from the Minister of Public Works, and for that offence he has been suspended from office for three months. The real reason, he states, was that the Government were anxious to see a different deputy elected. M. DIEULAFOY has resigned, and in a note he says that, although his professional career has been sacrificed, he does not think the price too high for representing a place where his family have been respected for many generations.

THE examination of the atmosphere of the House of Commons has produced remarkable results. The amount of carbonic acid, which was only 5.2 volumes in 10,000, is very little in excess of the quantity usually met with in the air of cities, and far less than is generally present in places of assembly. The bacteriological test revealed an undue number of micro-organisms, but none of them are found to be disease-producing. The First Commissioner of Works proposes that further experiments shall be made in order to discover the cause of the presence of so many microbes, with a view to taking suitable measures of improvement. From the time it was first opened there have been complaints about the oppressive atmosphere of the House, and yet there never was a building in which so many precautions were taken from the commencement to oppose everything that could be considered deleterious. The great difficulty arises from the want of direct communication with the open air and the care which is observed to keep all the approaches closed. When it is known that the foremost scientific men in England would co-operate to make the building safe, it is unaccountable that every session there should be a repetition of grumbling by the members.

As the land occupied by the fortifications of Paris will be used for building sites, the municipal authorities have wisely decided that a commencement is to be made with the part lying between the Porte d'Auteuil and the Porte Maillot. This means a strip extending along the east side of the Bois de Boulogne. M. BOUVARD, who is the architectural director of the municipality, has resolved that the ground is to be laid out in keeping with the commanding position. Every plot will allow of a large garden in addition to a house and offices. The roads will run as far as possible in an oblique direction, and will be broken in places with "ronds-points." No plan will receive approval which does not show a house or villa of an architectural character which will be worthy of the surroundings. The new district will be a rival to the quarter of Paris that is near the Parc Monceau.

## JULES DALOU.\*

THE nearest approach to the millennium desired by ROBERT BURNS, when "man to man the world o'er should brothers be," is to be found among artists, and it is never likely to be superseded. Geographical boundaries are of less account with them than with most other men. They have bonds of style and practice which are continually renewed. The loss of a great artist is therefore not confined in its effects to the country or city in which he lived. But the ordinary regret can be sometimes intensified in its depth in foreign lands, and one of those cases has arisen by the death of JULES DALOU, the French sculptor, who a week ago was laid to rest in the cemetery of Montparnasse, in Paris. In England we are indebted to him. He came to us as an exile, and as he was unknown in London he had to suffer the chilling fate which awaits most strangers. But when an opportunity was offered to him he paid us for shelter with a generosity that was without precedent. He not only imparted his art to students, but he kindled a living flame which we hope will never be extinguished. Those who are old enough to remember the sculpture in the Royal Academy's exhibitions some thirty years ago and will compare it with what can now be seen, will testify to the remarkable progress which has been exemplified in a short period. JULES DALOU was the light-bringer who revealed, as it were, the new world. It is true he found many eager youths who were groping their way after an ideal which they knew must exist, although the principal evidence of its existence was to be found in their own aspirations. But the services of JULES DALOU as a Phosphorus could not be dispensed with.

In the first place, he created a relationship with students of sculpture of which they could have had no experience. In this country, unlike France, masters in any branch of art are not disposed to impart their dear-bought knowledge to those who may one day be their rivals. A French artist's reputation is enhanced by the success of his pupils, and in consequence he is compelled to be communicative. The oldest member of the Académie des Beaux-Arts would not hesitate to mount to the highest garret in Paris if he thought his presence would be of any use in helping a young fellow whom he had encountered with a crowd of others in his atelier.

JULES DALOU possessed all the qualities which were desirable in a teacher, and especially for one who was to revolutionise the cast-iron system of the Science and Art Department, or rather to emancipate his pupils from that cramping thralldom. He may be regarded as being self-taught, and men of that class have most sympathy with a beginner's difficulties. He had attended classes in the schools of Paris, but he did not bear the hall-mark of the Ecole des Beaux-Arts, and officialdom could not point to him as a proof of the success of its method. It might be said with little exaggeration that he had to practise as a sculptor before he was taught. He belonged to a family of artisans, and he looked on himself as no more than one. If he worked, therefore, for ABEL DE PUJOL, DURET and CARPEAUX, it was as a practitioner rather than as a pupil. From the former two he quickly discovered the art of composition regardless of inspiration, and was not enamoured with it. But in CARPEAUX he recognised a spirit akin to his own, who was worthy to carry on the tradition of RUDE, imparting to it, however, a grace which was foreign to the virile talent of the sculptor of the *Departure of the Volunteers*. CARPEAUX was also a master bust maker, and DALOU was at least his equal if he did not surpass him. It seemed for a long time as if DALOU were destined to be a sculptor to the trade and no more. He had little time for experimental study, and from day to day it was his business to realise ideas which were not his own. But in 1870, when he was in his thirty-second year, he was awarded a third-class medal for his *Brodeuse*. By that modest distinction he advanced a step beyond the crowd of able but unknown men who were attached to sculpture in Paris.

Soon after, the greatest struggle since the Revolution of 1789 took place in France. DALOU's sympathies were with the labouring classes and other proletarians. He was

therefore found in the ranks of the Communists, and became an official of the Fine Arts Department under the new régime. Unlike GUSTAVE COURBET, he did not make war on Royalist or Imperial sculpture, and it cannot be said of him that he ordered the destruction of any fragment of ornament on a public building. All his energy was directed to the preservation of the treasures in the museum and public collections. France, nay, all the world, must be considered as indebted to him for the safeguarding of works which without his influence would have been destroyed or stolen. But when the party of order gained the upper hand DALOU's services were of no account in the eyes of the inquisitioners, and he wisely fled to London, the city in which sculpture was less valued than in most of the other of Europe.

DALOU was able to rely on the earnest patriotism of M. LEGROS, to whom so many Frenchmen have turned in despair, because they knew he believed, with RABELAIS that "les hommes sont nés pour l'aide et secours de hommes." DALOU was versatile, dexterous and industrious. He employed his genius in the production of genuine pot-boilers of various kinds. But a market did not exist in those days among us for figures which a sculptor could carry in his arms, and DALOU was taught by sad experience how bitter is the exile's bread, and how sick the heart grows with hope deferred. If he had always signed his name on those clay or terra-cotta figures, there would, of course, be no difficulty in identifying them. They are only to be traced by those who are well acquainted with the characteristics of the master's style. The search for them would reward connoisseurs; for, in spite of all the trouble which surrounded him, DALOU often found consolation in expressing the grace with which he was endowed. His fingers were extraordinarily delicate, and he was able without an instrument to model the smallest buttons on the garments of one of his statuettes. In those we have met with that sentiment is manifest which FALCONET considered to be the soul of sculpture—each figure has an individuality of its own clearly expressed.

It was soon seen that France could not for ever continue to be celebrating the triumph of one political party by vengeance on another. The days for a Reign of Terror were over. An amnesty was passed, and JULES DALOU was again free to add to the glory of his country by the exercise of his art. In 1873 his works were found in the Salon. His talent, it was quickly perceived, had not become weakened or led astray during his exile. Teaching, like mercy, sometimes blesteth him that gives and him that takes, and his temporary professorship in London may have given definiteness to his thoughts. Every year the interest of his works seemed to increase, until the climax was reached when the model was exhibited of the memorable scene at Versailles on June 23, 1789, a work which won for the sculptor the *médaille d'honneur*, and was judged worthy of place in the Palais Bourbon. As we publish an illustration this week of what is the masterpiece of JULES DALOU, may not be unnecessary to describe the incident represented as shortly as we can.

Our word Parliament has a French sound, but before the Norman Conquest there were *michel-gemotes* and *zwitten-gemotes*, or general councils of wise men, among the Saxons. But there is uncertainty about their constitution. One of the agreements in Magna Charta was that barons and other representatives were to be summoned, and this is circumstantial enough to show that the Normans were also acquainted with deliberative assemblies. The French States-General formed unquestionably a very old institution, and in course of time, besides the nobility and clergy, deputies from certain towns were admitted, thus forming the Three Estates of which so much has been said. The times of meeting were irregular and at long intervals. Absolute power was possessed by the king, and the States-General were only needed in extraordinary emergencies.

LOUIS XVI. found that the legacy left him by his predecessors in the shape of debt was too heavy to be sustained, and in the hope of finding some means of escape in 1789 the States-General were summoned. As a similar convocation had not been held since 1614, there was some difficulty in arranging the procedure. There were 270 nobles, 291 clergy and 557 of the Third Estate who responded. A general feeling prevailed that the new

\* See Illustration.

semblage was unlike its predecessors, and the first question that came up for argument was the title of a relief which was expected to exert much authority. The Third Estate wished to arrogate to itself the title of "National Assembly." MIRABEAU proposed "Representatives of the People" as more suitable, but eventually "National Assembly" was adopted by a majority. In that case the existence of the clergy and nobility was ignored. The Commons retained possession of the hall at Versailles, in which they had only a partial claim; for the Three Estates were supposed to deliberate as one body. On June XVI., realising that as his approval was not sought, power was at stake, made an order that separate halls and chambers should be used by the Three Estates. To execute his command, he sent his grand master of ceremonies, the Marquis DE BRÉZÉ, to direct the Commons to withdraw. The transaction has been graphically described by THOMAS CARLYLE in the following words:—

"For the séance itself, the carpenters seem to have accomplished their platform, but all else remains unaccomplished. Futile, we may say fatal, was the whole matter. Louis enters through seas of people, all grim-silent, and with many things, for it is a bitter rain, too. Enters to the Third Estate, likewise grim-silent, which has been wetted and wringing under mean porches at backdoors, while Court and privileged were entering by the front. King and garde des sceaux (there is no Necker visible) make known, not without windedness, the determinations of the royal breast. The Estates shall vote separately. On the other hand, the Commons may look for considerable constitutional blessings, as specified in these Five-and-thirty Articles which garde des sceaux is waxing hoarse with reading. Which Five-and-thirty Articles, adds His Majesty, again rising, if the Three Orders do not unfortunately cannot agree together to effect them, I myself will effect—" *Seul je ferai le bien de mes peuples*," which may be interpreted may signify, "You, contentious Deputies of the States-General, have probably not long to be here." But in fine, all shall now withdraw for this day, and meet to-morrow, each Order in its separate place, to-morrow morning, for each of business. This is the determination of the royal breast, pithy and clear. And herewith king, retinue, noblesse, majority of clergy file out, as if the whole matter were satisfactorily completed.

"These file out through grim-silent seas of people. Only the Commons Deputies file not out, but stand there in gloomy silence, uncertain what they shall do. One man of them is the exception, one man of them discerns and dares. It is now the King Mirabeau starts to the tribune, and lifts up his lion's roar. Verily a word in season, for in such scenes the moment is the mother of ages. Had not Gabriel Honoré been there, we can well fancy how the Commons Deputies, affrighted at the roars which now yawned dim all round them, and waxing paler in each other's paleness, might very naturally one by one have glided off, and the whole course of European history have been different.

"But he is there. List to the brood of that royal forest-voice; how low, low, fast swelling to a roar. Eyes kindle at the gleam of his eye. National Deputies were missioned by a king; they have sworn an oath; they— But, lo! while the lion's voice roars loudest, what apparition is this? The apparition of Mercurius de Brézé, muttering somewhat. "Speak out," cry several. "Messieurs," shrills De Brézé, repeating himself, "you have heard the king's orders." Mirabeau glares on him with fire-flashing face; shakes the lion's mane. "Yes, monsieur, we have heard what the king was advised to say, and you who cannot be the interpreter of his orders to the States-General; you who have no place nor right of speech here; you are not the man to trouble us of it. Go, monsieur; tell those who sent you that we were here by the will of the people, and that nothing but the bayonets shall send us hence." And poor De Brézé stammers forth from the National Assembly—and also (if it be on one faintest glimmer, months later) finally from the page of story.

"The hapless De Brézé; doomed to survive long ages in men's memory in this faint way, with tremulant white rod. He was sent to Etiquette, which was his Faith here below, a martyr to respect of persons. Short woollen cloaks could not kiss Majesty's robes as long velvet ones did. Nay, lately, when the poor Dauphin lay dead, and some ceremonial visitation came, he was not punctual to announce it even to the Dauphin's dead mother. "Monseigneur, a deputation of the States-General."

*lachrymæ rerum.*

The scene as it presented itself to the imagination of CARLYLE differed to some extent from that modelled by DALOU. CARLYLE supposed the arrangements of the hall corresponded with that of the modern *Chambre*

*des Députés*, and he therefore assumed there was a tribune, from which MIRABEAU thundered his reply. But for treatment in relief it is needless to say CARLYLE'S disposition would be unsuitable. Architecture in such a case must submit to limitations, and the number of planes allowable have to be few. Besides, by placing the spokesmen of royalty and of liberty face to face, the conditions of the impending struggle are suggested. DALOU, although an advanced Republican, was an artist. History compelled him to show how vast were the odds against the official who was the embodiment of feudalism. But DREUX-BRÉZÉ is represented as dignified and courageous, performing his difficult rôle as became a French gentleman. It was men of his class who politely solicited the English guardsmen to open the battle by firing first. MIRABEAU was no APOLLO, and the figure in the relief corresponds with the description of him. He was the man for the occasion, for without his presence the other representatives might have obeyed the king's orders and dispersed like mutinous schoolboys at a head-master's command. But the member for Aix had already hazarded many things which other men would consider valuable; the risks attending disobedience were of no consequence to him. As a composition, the relief would have gained if the man carrying the bench had been omitted, for diagonal lines are rarely satisfactory. But in an historical sense the figure was essential, for it is suggestive of the belief among the hangers-on at Versailles that the king's word was omnipotent, that the Third Estate was not of much account, and the sooner the hall was cleared the better for all parties. The man recalls the attendant in the Roman gladiatorial scene, who does not wait for the defeated combatant to receive the *coup de grâce*, but seizes hold of him as if he already encumbered the arena and was an obstacle to the next performance.

As a means of decoration for an historic building, the relief demonstrates the superiority of sculpture. DALOU'S work, with its marvellous variety of individuals, will endure as long as the Palais Bourbon itself. In case of danger it might even excite more interest than the building. A painting produced under circumstances like those we have to endure in England must lose some of its character with every year, and even in Paris, where the atmosphere is more favourable, there is also diminution of effect. That it is not an exact representation of the event which signalled the first exercise of power by the French deputies may be granted; but it is as expressive as the largest painting. For that reason DALOU'S work merits examination by all who wish to associate another art besides architecture with public buildings.

The success of the relief was sufficient to designate DALOU as peculiarly qualified to produce national monuments. He was engaged for several years on the immense *Triumph of the Republic*, which was erected in the Place de la Nation, Paris. Among other works of his was the *Triumph of Silenus*, the great vase in the Luxembourg Gallery, and memorials of ALPHAND, the director-general of the works of Paris, BLANQUI, the political theorist, and in his last days he was engaged on one of GAMBETTA for the city of Bordeaux. DALOU was among those artists who believe that not much is gained by full-length figures of men. We need not go beyond London for evidence of that fact. The physiologists say we are fast becoming like tadpoles, for with prominent men the head obtains development out of proportion to its functions as part of the economy of the animal. Whatever the cause, sculptors like DALOU think it is preferable to give only a bust of a man, and to let it be accompanied by figures which will become suggestive of his qualities or of his deeds. His memorial of EUGÈNE DELACROIX exemplifies this theory. To represent the painter in his habit as he lived would be to produce as strange a figure as Mr. WOOLNER'S *Linnaeus* or M. RODIN'S *Balzac*. We should see a man who was afraid of the air, and who, as he lived in an underground atelier which was as hot as an oven, dared not go out of doors unless he was packed amidst several garments. Instead of an amorphous mass, the painter's bust, to which Time, Glory and APOLLO appear to offer tribute, is to be seen in the Luxembourg Gardens, a memorial which is enough to excite the eloquence of every *rapin* in the Quartier Latin. "The law of all ornament,"

says Madame EMILE DE GIRARDIN, "is to appear light, fine, delicate, coquette, no matter whether it is made of copper or gold, of stone or marble." On that principle JULES DALOU would seem to have worked, thereby gaining a reputation for himself and adding to the beauty of Paris, his birthplace, by figures which will always serve as examples in which the principles of French sculpture are again realised.

### THE GUILDHALL EXHIBITION.

THERE are 151 pictures large and small in the collection which was opened on Monday in the Art Gallery of the Corporation of London. The number may seem limited, but it is the custom to avoid hanging works where they cannot be easily seen, and this year several are of immense size. Thirty-six are examples of English painters of the eighteenth century, and the remainder are by French painters. The latter for many reasons besides courtesy are entitled to be first considered.

The visitor will do well to remember that the majority of the French works not only belong to the eighteenth century, but were produced prior to the Revolution. They are consequently survivals of a state of things which no longer exists, and which they help us to recall. WATTEAU, by whom there are no less than ten works, an unprecedented number for a public exhibition, died in 1721, COYPEL in 1752, NATTIER in 1766, DE TROY in 1752, VAN LOO in 1765, LARGILLIÈRE in 1746, PATER in 1736, LANCRÉT in 1743. With many of those painters the spirit of the seventeenth century was strong. Aristocracy was the prevailing power, and art was one of the many servitors employed for its glorification. It must not, therefore, be expected that subjects which are now generally depicted were then attempted. That delightful painter, CHARDIN, having succeeded with examples of still life, began to represent *genre* subjects. But, to use the phrase of SAINT-SIMON, the "règne de vile bourgeoisie" had not commenced, and his little but true pictures of domesticities were unappreciated, although he lived until 1779, or almost to the eve of the change. Art, in fact, was so one-sided in its ministrations, it is easy to understand how the most strenuous of the precursors of the Revolution, DENYS DIDEROT, became almost hysterical before some of the paintings of GREUZE. If regarded from an ethical standpoint, GREUZE was occasionally more unsatisfactory than BOUCHER or FRAGONARD; but he dealt with plebeian subjects, and in his mawkish sentimentality he was not afraid to suggest a few of the vices which existed among the great and brought calamities to people of another class. *The Two Sisters* in the Guildhall, in which we see an old and aggrieved peasant keeping one of his daughters from the touch of her sister, a demi-mondaine, who has returned richly clad, wearing pearls and able to offer a purse of gold, is a picture which no artist would have dared to produce in the early part of the century. It hinted at a danger which used to be rigorously concealed.

As the patrons of art were the nobles who loved luxury and could indulge in it, the endeavour of the painters was to present life under its most agreeable aspects. If an artist had a turn for the moralities he was instructed to adopt "une moralité douce, aimable, qui plaise en instructif." No one looking at the pictorial scenes could have imagined that in a world which was so full of play there was sorrow to be found anywhere, or that so terrible a destiny was awaiting many of the gallants and their children. We have before us on the walls an ideal world. There are colossal pictures by BOUCHER and FRAGONARD which may be described as magnificent valentines, measuring over 10 feet in length. They are unreal as representations of life and manners, but they were useful to keep up the conventional notions of the time about love and lovers of high degree. At the end of the seventeenth century SAINT-SIMON, who was undoubtedly a man of strong intellect, declared he could not live unless he obtained the eldest daughter of the Duc DE BEAUVILLIER; the young lady was between fourteen and fifteen, and the lover, who believed he was in the last stage of despair, had not once gazed on her. That was tragic extravaganza. Would it not have been less ridiculous to depict the man who was to write such invaluable memoirs as a boy singing, playing, gather-

ing flowers, or boating with other children, including the duke's daughter? The garden parties, vows of love, pastorals, fêtes, masquerades, dances and assemblies were all simply ways of uttering "Vive la bagatelle!" The painters were as charming in their touches as any of the musicians who played on lutes or pipes, or the poets who wrote love songs. If judged by our English standards, nearly everything French in the Guildhall Gallery will seem to be artificial; but if rightly considered, that is, by endeavouring to place ourselves in the position of those who first looked on the pictures, they will be found as suggestive of the thoughts and manners of the time as any photographs or realistic paintings are now.

The first work is the *Concert d'Amour* of C. A. COYPEL. A man and woman, richly clad, are playing, one on a viola and the other on a hurdy-gurdy. Red is the prevailing colour, but it is rendered harmonious by the neighbouring trees and the vigorous treatment of light and shade. We prefer this work to his *Perseus and Andromeda* in the Louvre. *The Two Sisters*, by GREUZE, like so many of the painter's canvases, is in subdued greys and blues. This is the only example of his composition in the collection. The rest are heads of young people, with a portrait of his father, who deserves notice, for he was a master tiler and wished to see his son an architect rather than a painter; and a portrait of MAXIMILIEN ROBESPIERRE, which is more suggestive of the latent cruelty of the Sea-green than corruptible than any of those which are commonly engraved. It is, however, as much out of place amidst so many joyous scenes as HOGARTH'S murderess.

*The Garden Party*, by WATTEAU, shows four peasants and two girls. The figures are on a larger scale than usual with the painter, and it must be acknowledged with sadness that WATTEAU, like MEISSONIER at a later time, failed when he painted a figure exceeding a certain number of inches. The picture looks as if it had been restored, and by a hand that was clumsy. BOUCHER'S *Love Message* is a charming example of decorative work; it measures 136 inches by 73 inches, and is one of a series of four which are in the exhibition, and which alone are sufficient to afford pleasure that will repay several visits. It would seem to be recognised as a rule in such works that the lower part comprising the figures should not occupy much more than a third of the canvas, while the remainder should be devoted to a display of trees and sky. In the *Love Message* a pair of four ladies and a youth in scarlet are seen on the bank of a stream and are engaged in sending off a dove with a letter. The ground has that fertility in producing verdure which was desired by decorators, and to increase the effect an immense vase is introduced on a stand which is filled with flowers. In the second work, *Love Offering*, two barefooted girls are bringing blossoms to adorn the altar of Cupid, which is already surrounded with similar tributes. In the third, *Evening*, a shepherdess of the Dresden china type is asleep while a lover approaches and touches her cheek with a straw. In the last, *The Fortune-Teller*, we see a young girl seated at the base of a statue listening to an elderly dame in a long red robe; above are two amorini, one of whom is about to strike the maid with a dart. An abundance of fruit in this panel supplements the greenery. The panels will no doubt be compared with those by FRAGONARD, which are assumed to be the chief treasures of the exhibition. But in a decorative sense BOUCHER'S works are superior; they are glorifications of youth without any latent meaning or applicability, whilst in the other case the supposition that the children are representative of the matured debauchees DU BARRY and LOU-*Bien Aimé* is enough to make them appear as profanities of which only a degenerated artist would be capable.

NATTIER'S portraits of the Duchess of CHATEAULOU and of the Duchess of FLAVACOURT are sufficiently characteristic to suggest the grounds for the women's notoriety, but they also denote that the reputation of the painter as portraitist was merited. His *Madame Henriette de France* shows the daughter of LOUIS XIV. playing on a viola and clad in a scarlet robe stiff with golden embroidery, which stretches across the canvas and is a triumph of manipulative skill. The picture is reposeful rather than startling by its colour. The *Château de Cartes* was a subject which was pleasing to CHARDIN, for we know that he twice painted Young LE NOIR in seen in profile, wearing his hat and

in a room where there is an easel with a small canvas, suggesting perhaps that the boy was fonder of play than of painting. LOUIS TOCQUÉ was another excellent portraitist. *Madame d'Anger* shows an elderly lady with grey hair, more engaging in appearance than is usual with old ladies in France. CARL VAN LOO's *Marquise de Marigny* presents the relative of the Marquise de Pompadour with a somewhat simpering expression; but the dress adorned with roses, the long row of pearls and the curls form an admirable scheme of colour.

*Pastoral*, by J. B. HUET, would serve as an illustration of THEOCRITUS, for the shepherd is more Sicilian than Arab, and shelters himself from the heat in a classic red robe. *L'Amiable Accord*, by J. F. DE TROY, contains figures as large as life; one girl plays on a flute and another sings. The modelling of the hands is perfect. There is a fine architectural background, and a red curtain helps to the harmonic scale. This big work is one of the masterpieces of the exhibition, and the painter must have constituted a competent director of the Academy at Rome. ANTOINE VALLÉE worked in England during the short reign of GEORGE II., but he fled when the Revolution took place. He is recognised as the portraitist for men in authority, and his *M. De Noermont* is a fine example of a man having a powerful head, and who gracefully wears a crimson robe. His portrait of *Mdme. De Noermont* is less successful, and the dead pheasant in her hand now suggests she was cruel. One of his works is *Madame De Thorigny*, who holds a hand under a fountain, and in which a parrot, dog and negro are introduced. The family group by DROUAIS, a toilet scene by a Peintre du Roi, whose work resembles NATTIER'S. Engravings and photographs of her works have made Mdme. VIGÉE LE BRUN popular, and she lived until the middle of the nineteenth century, and was able to paint a thousand works of various classes. *Madame Rolund* is a life-size figure leaning on a harp, with, no doubt, all FIGARO BEAUMARCHAIS'S improvements, and looking towards the spectator. The face has an expression of reality which is one of the characteristics of the artist's works, although the truthfulness of her likeness has been questioned.

*Serment d'Amour*, by TRINQUESSE, has been, unless we are mistaken, seen before in the gallery. In it the artist has employed contrast with effect, for while one stout but enthusiastic girl effusively makes her vows before Cupid's statue, the other, who is of slighter build, hesitates as if she were afraid of the ordeal. *Le Baiser Gagné*, by FRAGONARD, has easily have been turned into a vulgar scene, but in this is unusual delicacy for the painter. But the most beautiful of all this artist's works in the exhibition is *The Girl at St. Cloud*. A mountebank's booth is introduced; the actors might be like those of PROSPERO, all spirits would melt into air—into thin air. Over the trees and curtains a light is cast which seems to combine a summer's day with evening, and to have the brightness of daylight with the mystery of moonlight. Many of FRAGONARD'S irregularities may be pardoned on account of his *Midsummer Night's Dream*, which is as difficult to make as one of TURNER'S chromatic poems. In MARIET'S *La Servante Justifiée* we have another well-executed little scene with a charming background; the subject is taken from LA FONTAINE, and the poet has inspired also the same painter's *Les Oies du Frère Phillip*. In the year there are seven examples by the artist. PATER'S *Champêtre* from its elegance is sufficient to account for the jealousy of his master, WATTEAU. In it there is no novelty, if we except the introduction of a child; but the disposition of the ladies and gentlemen, and the beautiful scenery in which they play and sing, make the scene like a dream. WATTEAU'S *Italian Comedians* merits attention, and it is not unlikely that players were the realities through which some of his most beautiful works were suggested. One who will compare *The Isle of Cythera* which is in the upper gallery with the version in the Louvre, of which has been published a large reproduction, will at once recognise the difference between reality and imagination in WATTEAU'S work. The small picture has all the elements of the more important one. There are the young people with pilgrim's avails, the amorini with torches, the gorgeous boat and the picturesque background. But we know it must be a scene for a masque, ballet, or other composition for the stage,

and therefore circumscribed in space, whilst in the Louvre picture space ceases to be of any account.

It is much to be regretted that the spirit which inspires so many admirable French works was without any effect on the collection of English works. A Frenchman, when he ascends the stairs and encounters as the first representative of English art PENNY'S ghastly woman dying in a chair, called *The Charms of Virtue*, with the even less attractive *Profligacy Punished*, an old gentleman over whose gouty feet scalding water is poured by a careless servant, cannot help thinking that the English in the eighteenth century, as before and since, took their pleasures sadly. Can such productions be accepted as art? Then we have such an atrocity as *Sarah Malcolm*, the murderess, by HOGARTH, and his hideous *Card Party*, besides PETER'S *Card Sharpers*, all of which are more displeasing from their proximity to the fêtes and idylls of the French painters. In the eighteenth century French critics declared that Englishmen could never become artists, and it must be admitted that there are instances enough in the gallery to justify the conclusion. ROMNEY'S *Lady Hamilton* is becoming a bore; here we have her once more as a Bacchante and as a lady praying. The tremendous equestrian portrait of General HONYWOOD, by GAINSBOROUGH, which measures 10 feet 9 inches by 9 feet 10 inches, might well have been excluded, for the valiant militiaman appears to be looking down from his saddle on the WATTEAU, LANCRÈS, PETERS, CHARDINS, BOUCHERS and FRAGONARDS as if they were invaders whom it was his duty to exterminate. In the collection there is not a single English picture which can afford the same sort of pleasure as is to be obtained by looking at nearly every one of the French works.

It is true there are some worthy examples. ROMNEY'S *Mrs. Yates*, the *Stafford Children* and *Mrs. Trench* are excellent. HOPPNER'S *Earl of Darinley* is a typical English boy. GAINSBOROUGH'S *Lady Bate Dudley* becomes incomparable owing to the contrast between it and the *Lady Hamilton* on one side of it. REYNOLDS'S portraits are always worth study. GAINSBOROUGH'S *Cottage Girl* makes one ask whether the contemporary French peasant children were not equally neglected, barefooted and carriers of broken pitchers. OPIE'S *Schoolmistress* is probably a family group of an old lady and her grandsons, for the boys are too big to be subjected to the punishment which SHENSTONE in his "Schoolmistress" described in such pleasing verse. The dame's head proves that the admiration for REMBRANDT which OPIE expressed in his Academy lectures was not confined to words. RICHARD WILSON'S Italian scenes were at one time beautiful, but years have acted as severely towards him as the picture-dealers and patrons of his day.

A special gallery has been arranged for the series of panels by FRAGONARD belonging to Mr. PIERPONT MORGAN, which were allowed to remain in Grasse for a century unknown to the French people. They were called the Romance of Youthful Love, and it has been said they were painted for Madame DU BARRY in the days when France was ruled by her and brought to ignominy. With works of this class, which differ in size and in character—for the flower panels are little more than paintings in monochrome, and in some panels a different scheme of colour was adopted—it would be desirable to be able to realise the arrangement of the room or gallery for which they were painted, as the lighting must have determined the manner of treatment. There is no certainty either that we have all the works, for as they appear at present they are like a story from which some of the chapters are missing. The titles given to them will suggest the subjects:—The Pursuit, Love Triumphant, The Rendezvous, L'Amour Folie, the Love Letter, Love Pursuing a Dove, Love as a Sentinel, the Lover Crowned, Love the Assassin, and the Abandoned. If it can be assumed that the amours of Madame DU BARRY and LOUIS XV. are symbolised, it is impossible to tell what connection the subjects may have had with the actualities. They are wonderful works, and, although we are without a key to the meaning, it does not debar us from being pleased with the fascinating landscapes, the graceful figures and the beautiful accessories. There is nothing laboured anywhere; the whole of the

works look as if they had come into existence at command and without any of the minute preparations which are necessary for the production of a work of art. Like BOUCHER'S panels, part of their success is owing to the effect of ease they produce in us. The principal panels are over 10 feet in height by about 7 feet in width. All parts are executed with equal felicity. The flower panels are of the same length, but their breadth is generally 16 inches, and yet there is no awkwardness in disposing of the roses, hollyhocks, &c. At present the contrast in colour between them and the larger paintings is too marked to be pleasant, and we suppose recesses were formed in the intended room which did not emphasise the differences. The series is not only a triumph for FRAGONARD but for the principles of French art as practised in his time, when the primary end of art was believed to be imparting pleasure.

In the fourth gallery we have a large number of cabinet pictures. An example by JEURAT portrays a drinking-bout, in which PIRON, who was not even an Academician, and two other poets, of whom no *mot* is recorded, participate, while some compiler of *Anas* enters their conversation in a note-book. BOILLY can only be partially claimed as an eighteenth-century painter. His *Artist's Model* and *Lady at Needlework* would, for their finish and spirit, be welcome in any collection. SAINT-AUBIN'S scene from "Figaro" is unfinished, but it has the promise of becoming a gem. The still-life pieces by CHARDIN are not comparable with those of DESGOFFE, while they suggest his painful attention to detail. A signboard for a perfumer's is remarkable as the work of so delicate an artist, but could not under the best light have been striking to passers-by. More characteristic is *La Fontaine*, a woman drawing water from a vessel. GRAVELOT'S—or D'ANVILLE'S—name is associated with illustrations of the *Spectator*, "Shakespeare" and other English books. He wrote a treatise on perspective in English; he assisted HOGARTH, and GAINSBOROUGH was his pupil. In the Guildhall exhibition he is represented by a small painting of a man reading. According to VERTUE he was constantly employed by artists in London to copy ancient buildings and tombs. One of the amusing pictures is WILLE'S *Dedication of an Epic Poem*, which is a satire on the writers of society verses. The book he reads is entitled "La Bagatelle," and is supposed to be in thirty cantos; one of the manuscripts in his pocket is a poem to Mimy, the little dog of Mdlle. de —.

There are other works we should like to notice, but we have said enough, we hope, to indicate the character of the exhibition. It is more difficult to appreciate pictures that belong to a different age than to criticise them. If, however, the French pictures are tested by the canons of art which prevailed when they were produced, they will be the means of giving much enjoyment, and it will be an advantage if an occasional wish is expressed that some of the spirit which animated the artists might more often find its way into English studios.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. W. Emerson, president, in the chair.

The SECRETARY announced that a statutory examination of candidates for the office of district surveyor in London was held on April 17 and 18. Of the three candidates who attended two passed, viz. Mr. T. H. Bishop, jun., of Leighton Buzzard, and Mr. A. M. Watson, of London. These gentlemen have been granted by the Council certificates of competency to act as district surveyor in London.

Mr. A. N. PATERSON, M.A., read a paper entitled

### Tradition in Architecture: Its Function and Value.

In defining the scope of his paper, the author said that, while guarding against a tendency to give undue prominence to the inheritance and teaching of past times, he sought to carry his audience with him in regard to the vital importance of tradition as an element in all art of permanence and value, in the hope mainly that the far-reaching voice of the Institute—not only within our own shores, but throughout the Britains beyond the seas—might be expressed and asserted to restrain, to counteract, to check the too easily learned and pernicious teachings of the so-called "new art" movement, with certain

cognate developments in English architecture. In using the term "tradition," he wished to disentangle it from another term with which it was apt to be confounded, viz. archaeology. The idea expressed by the word "tradition" in this connection was briefly the influence, both conscious and unconscious, upon us, as workers in art to-day of the methods of seeing and doing, the part of the many generations of workers who have preceded us, and who when in life were engaged in like problems to the which now occupy us. Tradition in this sense as regards architecture was twofold, viz. tradition in construction, tradition in design. Tradition must not be confused with style. Styles have their day and pass. Tradition endures. It must also be clearly differentiated from archaeology. The archaeologist's attitude is that of the scientist, not the artist, much less the architect. Defining the term "art" in relation to architecture, the author said that it was the living creative interest which devoted itself to the design and erection of buildings which will satisfy the requirements and be in accord with the sentiments of the time; that the art in these buildings is a necessary and natural outcome and development of similar work in the past, of which the technique is learned consciously and unconsciously through tradition; and that archaeology (with history in its train) is at best a science by means of which we may arrive at more precise knowledge regarding certain aspects of such work. That we should be able to say that a moulding is early, late or transitional, will not influence our powers of plan and design; its true importance to us is that in gaining exactness of knowledge as to such details we are bound to increase our knowledge of the work itself, of the constructional difficulties and the means by which they were overcome and rendered unexpected points of interest, of the infinite variety, the enveloping harmony and the crowning beauty of the building, which through years, at maybe centuries of growth ultimately reached the complete organic form in which we see it. Only—let such enthusiasms be kept under restraint. Do not let us take it for granted that because a feature looks well in an old building, therefore it will be equally effective if tacked on to a new front.

In the spirit of the old work we admire there are qualities more pre-eminent than directness of aim and honesty of purpose. These two qualities we shall find to be most surely preserved by working after the methods of our more immediate forbears. Architecture, of all the fine arts, is most subject to convention, and that under two main influences, the one immovable, unchangeable, the limitation of that construction through which it must express itself, and which in its turn is subject to the all-pervading law of gravity; the other, as constantly but gradually changing the physical, mental and spiritual requirements of those for whose use buildings are designed, together with the effective range of constructional resources at our disposal wherewith to satisfy these requirements. The accumulation of the tradition of former ages has provided us with certain methods, certain formulæ of construction, from which we cannot escape. On the other hand, it is only from our immediate predecessors, and even contemporaries, that we can gather to what extent the immediate requirements of the day must guide us in our use of these formulæ, and what constructional resources are available for the purpose of extending their scope. The leading contours of mouldings and the principles regulating their use, the right and beautiful proportion—such as these are the traditional data with which architectural design is produced; it is only when new materials intervene, or in a particular situation, that variations even to the extent of discords, are admissible and, in the place, admirable. Be sure, however, of the harmonies before introducing the discords. Only the master can successfully cope with the bizarre, the unexpected. There may indeed be bondage of tradition as of archaeology, but this is impossible when (and this the author took to be an essential and vital principle in the truly traditional attitude) it is accepted in its widest form, when the tradition of yesterday and even of to-day is regarded as of not less but more importance than that of the century of Wren, of the Gothic master builders, or of the Greek and Roman classics, when the tradition of steel girder, plate-glass and electric light is accepted along with that of stone vault and flying buttress.

The author went on to speak of the present position of architecture in this country. For nearly a hundred years England has followed a path all her own in such matters, with results which can scarcely be called successful. The path has led, as it were, through a maze, and we are likely to end, when we emerge, precisely where we entered. Meanwhile, neighbouring continental nations have been quietly pursuing and developing the traditions of earlier times in the light of modern opportunities and requirements, guided therein by a continuous and systematic study of architecture, with the result that, in regards civil architecture in particular, they are far ahead of us in achievement. Few modern English buildings compare with similar work in Paris and other European centres in any of the attributes which constitute architecture a great art; yet English work of earlier date is equal, if not superior, to foreign. The moral is obvious; the fault is not the nation's or the men's

point of view, the methods and, above all, the lack of continuous tradition; while if the doctrines of the "modern" are to prevail among our younger men, the outlook for the future is still worse. The author briefly glanced at the architectural history of England during the nineteenth century to make clear this idea. Within the last few years, however, the love of tradition, modern as well as ancient, has shown a tendency to reassert itself; architecture, along with the crafts which nourish it, has been revived, the true principles of architecture are being taught with organised effort, and but for this "new art" development there was good hope that the architectural history would again assert itself in its natural and characteristic characteristics of dignity and refinement. Of the characteristics of this "new art" or "modern school" there were three manifestations; the one prevailing tenet seemed to be the "copying of styles" is to be avoided as a deadly sin. The author asked the author. It was the first time in the history of architecture that a like position had been taken up, for it is surely an admitted fact that, from Assyria and Egypt to the architects of Greece and of Rome, of the Roman Empire, of the Medieval and Renaissance times, had no other idea in their minds but, in working out constructionally their fulfilment of contemporary requirements, to copy the styles which had preceded them, as they knew them. Did the work thus produced in regard to sympathy with the needs of the times, to its beauty, even to originality thereby?

Is it this taboo of the styles that the characteristics of the new movement are to be traced. The refusal to employ the formula thus provided has its necessary result in the prevailing baldness, the absolute lack of variety and movement. The styles, especially those of the last few centuries, are essentially the product of civilisation; the architecture of modern times is mainly that of the city, but as recent precedents must be ignored and architecture cannot escape from the traditional point, inspiration must be sought in the times before city life existed, with a resultant sham rusticity, an assumed simplicity of living and thinking entirely at variance with the habits and habits of those whose requirements the buildings were supposed to supply, and even, if due investigation were made, with those of the designers themselves.

Another characteristic, the result of the same tendency, is the attempt to return to the conditions of working of those earlier times when the individual worker was—or is now supposed to have been—his own master in the particular portion of the general work to which he devoted himself. The said individual worker is, of course, under present-day conditions, unable to play the part thus allotted to him, but if he is employed, not by a "firm" but by a "guild," all is right, and the utmost title is at once allowed to the producer in matters of furniture and ornament, with a consequent loss of homogeneity and stiffness in the general scheme. The half-trained amateur, too full of art enthusiasm to consent to the drudgery necessary to acquire technical skill in execution—being an artist—must be allowed absolute independence.

To encourage the crafts by all means, give the craftsmen the liberty within their own spheres—the architect will be made and stimulated by their co-operation and help; but his duty is to be the guiding and controlling mind, and his work may, often must be, independent of their aid. Let it not be thought that it is by working only on such lines as those just mentioned upon, as its devotees would have us believe, that one can be earnest, or even original. He was inclined to believe that the love of originality for its own sake was the root of all evil in the pursuit of the fine arts. For indeed that, desirable as it may be, is just one that will not come by "taking thought" for it, and if it be sought after in this fashion the result will be a superficial affectation which is at the opposite pole to those solid and enduring qualities which are of ultimate value in the arts. But if the architect, instead of seeking originality and endeavouring to take it by force of devious and strange revivals, is content to follow the quiet lines of tradition, holding at the same time true to himself and the requirements and opportunities of his day, it will be found to have sought him. Future generations will see in his works the real beauties and qualities of his period just as we to-day see them in those of our predecessors.

Mr. G. H. FELLOWES PRYNNE, who proposed a vote of thanks, said the paper was of great interest, and in the main that of them would agree with the conclusions therein. In his wish to uphold tradition Mr. Paterson seemed to have wandered on the lines of many others, and to have abused those architects who had worked in the past. Architecture had been passing through a revolutionary time, but a vast amount of good had resulted therefrom. Though the Gothic revival was often of revolt from a hard-and-fast style, yet the ultimate result was beneficial to art generally. The deep study of the Gothic and Classic revivalist architects was found to be of service to the men who followed after them.

Mr. W. C. H. WILSON, who seconded the vote, said the work of to-day should be eclectic. It would be hard to classify architecture under any one style, but yet the English

architecture of to-day showed an amount of individuality of thought and of the conditions of the time far exceeding such work in France.

Mr. H. T. HARE, Lieut.-Col. PRENDERGAST and Mr. E. HUDSON also joined in the discussion.

## LEEDS AND YORKSHIRE ARCHITECTS.

THE Leeds and Yorkshire Architectural Society held its last meeting of the session on the 17th inst. at the rooms in Park Street, Leeds. Mr. Butler Wilson, F.R.I.B.A., was elected president for a second year, and Mr. R. Wood and Mr. G. F. Bowman were appointed vice-presidents, the former being re-elected.

It was mentioned by the secretary (Mr. H. S. Chorley) that there had been an increase of twenty-six in the membership of the Society during the year. He added that while professional interests had been carefully watched over—notably in connection with the proposed new building by-laws and the assessorship of the recent public baths competitions—greater attention than previously had been paid to matters of public interest, instancing the steps taken by the Council of the Society in regard to the Queen Victoria memorial.

The President observed that the work of the Society had been consolidated and strengthened during the past year, and that the aim of the Council during the ensuing year would be to give effect to the proposal to provide increased facilities for students, notably in establishing a chair of architecture at the Yorkshire College, similar to that at Liverpool. It was hoped, he said, that the allied societies and independent architects of the county would combine to put the proposed chair upon a sound financial basis.

Subsequently Mr. J. Starkie Gardner, F.S.A., of London, gave a lecture on "Decorative Wrought-iron Work," showing illustrations of work, mostly of the seventeenth and eighteenth centuries, from Italy, Spain, Germany and France, examples of which are being gradually collected and carefully classified at South Kensington. In the sixteenth century the English smiths far outvalued their continental confrères in design of metal-work, not from any advantages of site or materials, but from an innate love of form which continental craftsmen, notwithstanding their culture and civilisation, were unable to equal. The age of wrought metal, said Mr. Gardner, had passed. Royalties and municipalities will not now expend the necessary amount so ungrudgingly and lavishly given in the days of Louis XIV. and XV., who expended many million livres upon this one craft. Cast-iron and rolled steel have hastened this regrettable decline.

In proposing a vote of thanks to the lecturer, Mr. R. P. Oglesby pointed out that some attention is now being given to the artistic treatment of engineering structures, instancing the buildings of the Paris Exhibition.

## CUENCA CATHEDRAL.

THE Madrid correspondent of the *Times* writes under date April 15:—"The catastrophe which befell the cathedral of Cuenca the day before yesterday, will not be without some good result if it stirs the authorities to take a little more interest in the reparation of ancient buildings which lie outside the general track of visitors. Cuenca, some 60 miles east of Aranjuez, though an inconsiderable town itself, possesses a fine Gothic cathedral of the sixteenth century, but little known on account of its distance from the most frequented centres of Spain. It would appear, from a question asked in the Senate yesterday by the Count de San Luis, that the dangerous condition of the cathedral tower was recognised so long ago as 1888, when a grant of 100,000 pesetas was solicited from the Government for its repair. The money was not forthcoming, and no adequate measures have since been taken to insure the safety of the tower. It has now fallen, causing the death of some six or seven people, chiefly children, and threatening the further collapse of a great portion of the cathedral itself. As a matter of fact, the burden of repairs should properly fall upon the municipality, but it is a duty which can hardly be efficiently performed by the *ayuntamientos* of small and impoverished towns, and it would be well, if, in their case, the Government could come to their aid."

Mr. Thomas Sidney Cooper, C.V.O., R.A., who was born on September 26, 1803, and died on February 7 last, left personal estate of the net value of 18,557*l.* *os.* *2d.*, and the gross value of his estate is 40,658*l.* *9s.* *7d.* He bequeathed the picture upon which he should be engaged at the time of his death, and his palette, knife and brushes, just as they were left, to the corporation of the city of Canterbury, with the request that they should be placed in the Sidney Cooper Art Gallery.

## NOTES AND COMMENTS.

THE Chancellor of the Exchequer was asked on Tuesday whether he was prepared to put a heavy registration duty on flags that were to be imported from abroad for the approaching celebration. If they are to correspond with the specimens which have been seen in London shops it would be advisable if duties which would be prohibitive were imposed. What is more, foreign countries, if they valued their reputation, would do well to impose an export duty on flags for England. The colours adopted have to be according to laws which the heralds have long ago formulated, and it is possible to have all varieties of English flags in correct colours which will be bright and pleasing. But the horrible reds and blues which are likely to afflict the sight of Londoners in a couple of months are not sanctioned by heraldry, and should not be permitted by law. Evidently the foreign printers of textiles are assured of the prevalence of colour-blindness in England, and consequently they produce effects which would not be tolerated in any other country. In one case at least it must be admitted that we deserve the treatment we are to receive. The Japanese, with characteristic enterprise, have been early in the market, and what they have sent us will form a melancholy spectacle of the degradation of the artistic sense. The English demand for Japanese goods for several years has been large, and the incompetence of purchasers to distinguish good from bad in forms or colours has encouraged the manufacturers in their downward tendency, of which the extreme has been reached in the Coronation properties. Authorities may declare the necessity of adopting artistic schemes; but so long as coloured cloths which no savage would accept as barter will be allowed to float in all directions of the Metropolis, it does not matter what may be resolved about the necessity for respecting the laws of taste.

THE death of M. EDOUARD-AMÉDÉE DIDRON, at the age of sixty-six, deprives France of an industrious archaeologist, who conducted the "Annales Archéologiques" during several years. He was also esteemed as a glass-painter, and designs by him were often exhibited in the Salon. M. DIDRON was the author of books on some branches of industrial art, and carried out the decoration of numerous churches and other public buildings. He was an influential authority on all subjects relating to the connection of art with archaeology. M. DIDRON was the nephew and adopted son of ADOLPHE NAPOLEON DIDRON, and may be said to have continued his uncle's work. In 1844 the elder DIDRON founded the "Annales Archéologiques," and conducted it until his death in 1867. His "Christian Iconography" was translated into English, and at the time of the Gothic Revival there was no foreigner whose name was more often mentioned in support of statements at the meetings of archaeological societies in this country.

DURING the last twenty years projectors and others have been speculating about the conversion of the Devonshire Meadows between Chiswick and Strand-on-the-Green into building land. A promenade with fine villas along the river was a common feature in all the proposals. A part of the land was utilised for a sewage-farm, but no indications of houses are yet visible. It is now announced that negotiations have taken place with the owner, and there is a likelihood of forming a model town upon the land. A part of the Duke of DEVONSHIRE'S estate has already been turned into building land, and as the start has been made we presume the only obstacle to the utilisation of the remainder is one of finance. On the north side the meadows are bounded by a road known as Burlington Lane, for the estate was once possessed by the BURLINGTON family, and the architectural earl's villa, which was said to be "too little to live in and too large to hang to one's watch," is found in the grounds on the other side of the road. On account of those associations it is proposed to call the new townlet Burlingwick. About 330 acres will be required. There will be sites reserved for churches, and if the Chiswick authorities wish to increase the taxation by erecting workmen's dwellings they can obtain a moiety of the property at a reasonable price. At present the chief drawback is the river, which at times is not a pleasing sight, but

if a suitable embankment is made and one or two locks are introduced the Thames would then be the leading attraction of Burlingwick.

WHEN TURNER died he left his property, which was thought to be worth 140,000*l.*, for the benefit of art and artists. There is no doubt he intended that the whole should be appropriated for the public benefit. Litigation followed owing to the careless manner in which his will was drawn up, and after four years a compromise was arranged. The National Gallery became possessed of his pictures and drawings. Mr. RUSKIN devoted a very long time to the arrangement of the latter; the least sketch was precious in his eyes, but a great many could not have any interest for the public. There is, however, a prevailing belief that the most valuable examples of his art are decaying in cellars at Trafalgar Square. On Friday last one of the members of the House of Commons inquired of the Secretary of the Treasury whether there were numbers of TURNER drawings stowed away in boxes at the National Gallery; and, if so, whether he would take steps to have them distributed amongst other picture galleries. The reply was in the negative; it was stated that, besides the drawings exhibited at the National Gallery and the collections which are lent to galleries in the provinces, there are eleven tin boxes containing rough sketch notes, chiefly in pencil, on leaves of small pocket-books. But the contents of these boxes have been repeatedly sifted, and everything at all fitted for exhibition selected from them. We do not suppose that the answer, although explicit enough, will set doubts on the subject at rest, but with a view to that object it would be well if some member would endeavour to discover the benefit which was derived from the drawings which are in circulation.

THE use of concrete is now so general in the United States, especially in connection with steel beams, that the material becomes a subject for investigation by theorists. Experiments on its expansion have been carried out under the superintendence of Professor W. D. PENCE in the School of Civil Engineering, Purdue University. It has been usually assumed that the co-efficient of concrete is similar to that for the expansion of steel. But it was established by the experiments that the co-efficient of expansion of gravel concrete is 0.000054 per degree Fahr. and of broken stone concrete 0.000055 per degree Fahr. The co-efficient of expansion of steel is generally taken as 0.000065 per degree Fahr. That may appear only a insignificant difference, but it means about 15 per cent. less for concrete than for steel. In the case where steel beams and concrete are combined, the difference must produce stress in both materials. Concrete of course cannot sustain tensile stresses equally with steel, but Professor PENCE holds that the stress per degree during changes of temperature would not exceed a quarter of a pound per square inch, and if there was a very great change of temperature, say 100 degs., the stress would not be more than 25 lbs. per square inch. In Chicago provision is made for expansion in concrete in retaining walls by having a joint at every 50 or 60 feet. But in small walls it is advised that joints should be provided at every 30 feet or thereabouts. Professor PENCE believes that temperature stresses cannot be serious for the following additional reasons:—(1) The chief range of temperature from that which prevailed at the time the concrete first adhered to the surface of the steel is downward, producing a compressional stress in the concrete section, since the steel contracts more rapidly than the concrete. (2) The changes of temperature in the structure will be gradual, owing to the fact that concrete is a poor conductor of heat. (3) Reinforced concrete beams will sustain on the tension side, without rupture, a proportionate distortion of from ten to twenty times that at which the simple concrete beam would fail. (4) Interior stresses are relieved more or less by the slipping of the metal bars in the concrete.

MIRABEAU REPLYING TO M. DE DREUX-BRÉZÉ.

PARR'S BANK, LIVERPOOL: TELLING ROOM. DETAILS.

WESTOVER, MILFORD-ON-SEA.

# TRURO CATHEDRAL.

following is the report by Sir Thomas Drew, to which we have already referred:—

I have given earnest attention when at Truro, on December 11, 1901 last, and since, to the fractures which have developed in the piers of the cathedral. I have had the fullest and most intelligent information given me as to facts and details of the building by architect, builder and clerk of works.

I have also the fortunate advantage that I was a witness of the building of these piers in September 1900, when I was specially as a visitor to Truro to learn something of the greatest ecclesiastical architect of his time (as I have since, with no reserve, expressed my sincere admiration of the late Mr. Pearson) designed and built his modern cathedral. I have since, with no reserve, expressed my sincere admiration of the modern cathedral design and the honesty of the modern builder's work, and the method of the clerk of works in faithful carrying out of the modern plans and specifications.

I desire to state in the forefront of my report what might be a normal order at its conclusion. While I have no hesitation in giving my opinion as to the cause of the untoward occurrence of fractures—being in fact wise after the event—I have no criticism for the designer of these piers.

I may state here that though well acquainted with the quality of Corsham Down oolite as a weight-bearing material, I want of judgment in the use of this stone did not occur

the characteristic distinction of the building of the Mediaeval architect. A feature of the ancient construction was the adaptation of bedding and jointing as a means to an end, that of seating and adjusting stones in weight-bearing piers, so as to distribute pressure through successive courses.

Thirty years ago attention of architects was awakened to the fact that rigidity of construction, adopted from the modern engineer, was not advance in science, where stone-laying survived as a craft, by an alarming disaster in the failure of the granite columns of the Holborn Viaduct at its opening on November 9, 1869, and which created somewhat of a public panic. As it illustrates the far less important occurrence of some fractures at Truro in 1901, it is worth recalling. The first engineering and architectural opinion of the day was called on to investigate the unforeseen occurrence. The indisputable resulting verdict was as follows:—

"Had the hexagonal piers been built in 13-inch courses, no undue stress would have been thrown on the exterior part of a single layer. Whether they had been built in mortar or in lead, the weight would have been fully distributed course after course, instead of being thrown on a few points, under the angles of a monolith. It is not therefore as an eyesore only, but an offence against structural rule, that we must hereafter carefully avoid the juxtaposition of stone courses of very unequal magnitude. The ancient builders were well aware of this important canon of their craft."

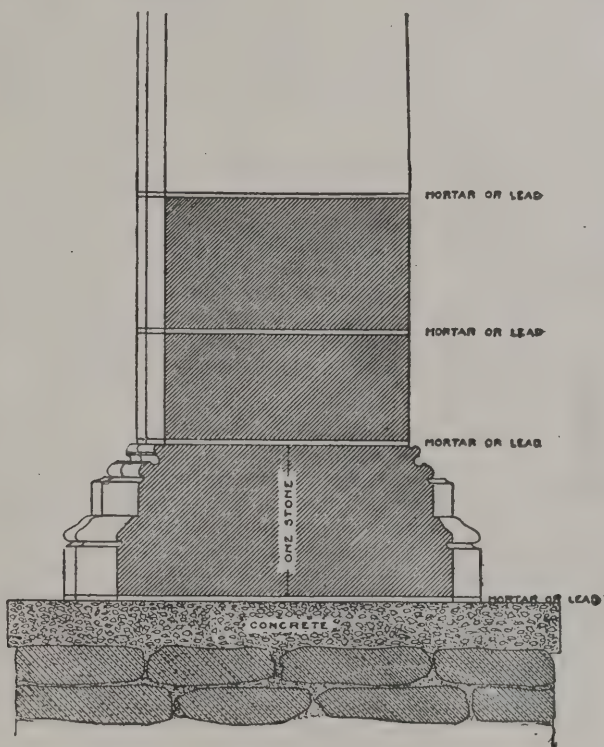

The lesson of that disaster has been forgotten or unremarked

As Built.

3/4 INCH SCALE.

As Restored.

3/4 INCH SCALE.

I knew of the late Mr. Pearson's extensive use of this stone in his churches and in nave piers as proportionately light and strong, and I had too great trust in such a master of design and construction as to entertain a question that I had not perfect experience of the stone he selected to do its work. I have, however, fully investigated this question on its merits and state conclusions for the assurance of the cathedral committee at the end of my report.

I have carefully read the contract and specification as applied to the building of the piers, and the latter is in terms not far from what is generally accepted by modern authority. The building of the piers, and the latter is in terms not far from what is generally accepted by modern authority. The building of the piers, and the latter is in terms not far from what is generally accepted by modern authority. The building of the piers, and the latter is in terms not far from what is generally accepted by modern authority.

It is to be remembered that though many great stone-built churches have sprung up in England in modern times, there is no doubt that so revives the Mediaeval cathedral of the thirteenth century in its design as does Truro Cathedral—in its details of mobile construction restrained by counterweights, of balance, counterpoise and thrusts which were

by modern masons. I am familiar with such failures of monolithic-bearing granite or marble shafts, which are a certain vulgar fashion and offence to structural instinct in churches known to me.

Seeing at my visit in September 1900 that the Truro piers were being built in courses and very carefully laid, it did not occur to me, as an architect, to look for any weak point in the construction, nor did I arrive forthwith at a reason for the development of undoubted weakness on my arrival at Truro on December 11 last.

After prolonged study of the fractures it was plain to me that there was no difference in character of the fractures at Truro Cathedral from those familiar to me elsewhere in monolithic-built piers, where undue stress was isolated on the bases. In this case the fractures started from the bottom of the piers, and not only indicated that they would be consistent only in connection with monolithic-built piers, but moreover pointed to some exceptional bedding in the bottom course.

The cause of disaster, obvious to me, arises from the modern specification as to mortar and bedding, observed with a precision which is quite unusual to my experience of less conscientious builders.

In Mediaeval pier building, which I have had considerable opportunity of studying, the constructive method would have been different, and to the ideas of some modern constructors comparatively rude and barbarous. Beds of piers in old work

are usually laid in comparatively thick swimming beds of mortar, and the mortar is an unscientific mixing of lime and sand by rule-of-thumb, and none too good—not "too good mortar," as an old-fashioned mason would describe mortar suitable for restoration of coursing of bearing piers, which lends itself to a certain elasticity through all beds.

At Truro the mortar, according to modern specification, was to be theoretic perfection as a cohesive cement, using superior hydraulic lime, and with modern grinding, measuring and mixing, producing a scientific cement, such as Mediaeval masons had not. Bed joints, according to our specification, are to be no more than a bare  $\frac{1}{4}$  inch thick of superior cement. The stones are to be bedded in it for their full superficies out to the face of the stone.

The jointing, too, of the piers at Truro is, in modern acceptance, theoretically perfect. The perfectly truly wrought beds of the courses were worked into their seats until a  $\frac{1}{4}$ -inch joint became more like 3-16 inch. The several drums of the columns became so perfectly adhesive (as a glue joint in wood might be) that the pier becomes practically a monolithic one, with the attendant risk of undisturbed pressure all coming in this case on a single bed, and that under the plinth.

The nature of that bed differs essentially from the other beds. It is practically a  $\frac{3}{8}$ -inch bed of asphalt intervening between the surfaces of a rubble masonry foundation pier, more or less irregularly composed and surface-levelled, and the smooth-faced wrought under-bed of the plinth course of the pier.

For some reason at Truro the necessity of the provision of a damp course has been manifested to prevent moisture being drawn from the subsoil. Accordingly, the usual modern specification provision of a layer of liquid-run asphalt comes in as a sort of matter of course. It would not occur to the draughtsman of most modern specifications that there might be cases in which the damp-course layer of asphalt would be better omitted.

It may now be seen that asphalt, a different material in its setting action and hardening from the mortar joints in the rest of the pier, and more or less compressive and defective over any irregularity of surfaces, was an unfortunate insertion at the bedding joint on which stress was concentrated. Under the whole circumstances it can now be seen that the accident is explicable. The tightening of the base stones unequally on their bearing surfaces is manifest, and the fractures starting from the base bed and running up through two superimposed thin layers of inflexible stone,  $11\frac{1}{8}$  inches and  $9\frac{1}{8}$  inches respectively, seem bound to occur.

It is to be noted, further, as perhaps contributory—according to dates furnished me—that these piers were carried up with a certain modern energy and impatience under a certain modern contract, and the weights were perhaps rather soon imposed on the substructure; \* but it impresses me more that the modern mortar was too prompt in its setting quality, and too thin to allow of the automatic adjustment that is afforded by a thick swimming bed of old mortar, permitting the stones to find their seats and distributing stress through successive courses.

A modern method somewhat favoured of bedding wrought stones out to the face and pointing up the joints as the work rises was followed, and it is a practical method in ordinary circumstances with suitable mortar rightly handled. In this case, however, tight bedding under the weak spur-bases contributed to the fractures most manifestly.

The consideration now comes—What is best to be done? It will be advanced by some no doubt with some apparent reason, that there has been no spreading of the first fractures; that the base stones have found their bearing, and are manifestly carrying the weight imposed, and might so remain.

I would not take the responsibility of advising such inaction, and for the following considerations. Truro Cathedral is typically a construction of Gothic ingenuity of forces kept at rest by counterpoises and clever distribution of parts. There are few old cathedrals which do not exhibit some shifting of equilibrium in course of time from settlements, decay of buttresses or counterpoise weights or some structural alterations. In two cathedrals which are my charge there is probably not a thirteenth-century pier standing truly upright. It is not impossible that at some time or another some disturbance might affect true plumb in Truro Cathedral piers, and the least shift of pressure on fractured bases might mean disaster then.

There is also wind pressure to be reckoned with in such structures. An illustrative case is furnished lately within my own observation. A large church had been built to its full height. Its nave piers had monolithic polished shafts, manifestly upright and carrying their superstructure. Here, however, the motive tremor was supplied by an Atlantic hurricane,

\* Capitals of piers were laid four months eleven days after bases were laid. Owing to the casing covering the bases there was no discovery of fractures until June 18, 1891, and no possibility of discovering when they occurred.

beating on the north flank of the nave. At the least tender to a "rocking" pressure on the beds of the capitals and bases, the stones flushed at these points, and the immediate collapse of the whole church, which had cost some thousands of pounds, followed. It was not, in my opinion, required to a catastrophe to an earthquake, as was locally done, but should not be forgotten either that there are recorded cases in very late years of structural disturbances of old churches in England from slight shocks from which our islands are exempt.

With such eventualities, even if remote and improbable in my opinion it is a duty to restore the bases soundly in Truro Cathedral. I cannot think it would be even satisfactory, as a matter of feeling in Truro diocese, if any tradition should obtain of any flaws in its great church.

The work of reparation can be done, and, in my experience of restoration work, the cost involved is not so serious that it should stand against the considerations I have advanced. I should perhaps add for those unfamiliar with such restoration operations, that no comprehensive shoring of the whole nave is involved in effecting local renewals of some stones. The moderate provision of plant required is applicable to one pier or pair of piers at one time and removable to the next.

The staying and upholding of piers and arches while under building was being undertaken in repairs was an operation familiar to ecclesiastical builders of the later Middle Ages. They were called on to exercise it often enough, for the fault of their more tentative and experimental predecessors, as well as their own occasional defaults in materials, gave them frequent opportunities to exercise this art. The ordinary master builder of our time is not usually concerned with such operations, nor can he be expected to command in his service the specialist resourceful workmen who are essential to deal with such restorations. The demands, however, of church restoration for half a century past have called up and kept in existence specialist restoration workmen no less skilful and confident than their Mediaeval predecessors. To such hands only should such a critical work of this kind be entrusted.

It is unnecessary now to enter into details of centreing and strutting, &c., by which a superstructure can be held up while a substructure is under operation, but the procedure of restoration should, I consider, be this.

The fractured stones should be taken out and replaced by sound stones. It involves no question as to Bath stone having been suitable for employment in the first instance if I recommend, for convenience and safety in an insertion, a basalt stone, Portland (Whitbed) or Doulting, and that, for this occasion, the plinth and bases, now in two courses, should be wrought in one stone, 21 inches deep.

The rubble foundation should be lowered to admit of a level "copestone," which in this case might be of strong concrete, 6 inches deep, which would be a seat for the renewed base, and also a damp course in itself.

The above covers in general terms the procedure I would specify, so far as study of the outside of the piers now instructs me. I should withhold opinion, properly, as to what courses above the bases should be disturbed and relaid in differing cases of different piers, and as to the nature and number of the lists to be renewed, and whether in mortar or sheet lead. These are details for consideration from day to day for consultation between the architect and his skilled practical masons, as the interior of the work is opened up and viewed.

My general impression is, that the magnitude of the occurrence of such fractures as these should not be overrated, or should they cause anxiety. Such unlooked-for occurrences are incidents in carrying out many great building contracts which are not heard of, and are of no outside interest, and are right, and are to the builders a vexation not an anxiety.

#### *The Sufficiency of the Stability of the Corsham Down Bath Stone.*

It may surprise some to learn that, in point of fact, the working architect has not any data from which he may go down with professional assurance what weight to the square foot of surface any description of stone ought to bear. Tables of crushings weights there are, experiments on salt cubes of 1-inch,  $1\frac{1}{2}$ -inch, or 2-inch, which can only point to comparative strength as between one stone and another. Conclusions founded on them as to bearing weights on larger masses of stone must be empirical and misleading. Even in these inapplicable tables of the stone books for practical work, these "authorities" differ so widely that it is useless for an architect to consult them. According to one authority in a leading textbook, the safe weight of a superficial foot of Corsham stone should be no more than 4 tons. According to another, based on the same table of crushing weight, it might be  $8\frac{1}{2}$  tons. According to another familiar to most architects for daily guidance, the limit should be 8 tons. When one sees how enormously these limits are exceeded in practical building in everyday work, and when one stands, the value of such authority is discounted. Some stones

stones from Truro for Mr. F. L. Pearson on stones of size are, perhaps, more practical and instructive for than any given before. They have been made by ly, of London, and certified. Even Mr. Pearson's tests, resting table of which I forward, bring out various and results; but I think they might satisfy that good m Down stone may be trusted in piers up to a crushing of 150 tons per superficial foot. Now, following mere ty, which lays down in one case that the safe weight be one-twentieth of the crushing weight, and another, its it as arbitrarily as one-tenth, and adopting the latter time, the safe weight would be 15 tons per foot. But, to the late Mr. Pearson's practice, I have obtained very capable architect of Bournemouth, Mr. Fred. ey, an admirable analysis from actual measurement of ture of Mr. Pearson's fine church of St. Stephen in wn. It shows that Mr. Pearson did not hesitate to tax rs there up to 27 tons 18 cwt. to the superficial foot, and rort is that "there is not the least sign of fracture any-

ve had also an independent computation made of the weight borne at Truro, such as has not been made by a surveyor selected for his experience and intelli- for such inquiry, Mr. W. H. Stephens, of Belfast. His is that the actual estimable weight on the large piers at is 156 tons 13 cwt., and on the smaller piers 130 tons 1 qr. That gives on one greater and one less pier, as pporting a 27-feet 6-inch bay, a weight in aggregate of is 15 cwt. I cannot fairly assign a net working bearing to the pair of piers greater than 13 feet superficial, would be equivalent to 22.4 tons per superficial foot, and be about one-sixth to one-seventh of the crushing weight 150 tons, instead of one-tenth as laid down by arbi- rounouncement of theory.

I confess that my confidence in the sufficiency of the piers ro rests more on my confidence in the constructional and great experience of the late great architect, L. Pearson, than on abstract theories. I am confident ere are reasons enough for occurrence of fractures at without touching any element of inherent weakness in ne used, and they would have occurred all the same, I e, if Portland or Doulton stone had been used.

T data required for any theoretic calculation of the bear- ciency of Corsham Down stone in the piers at Truro, e weight to be borne, are now ascertained and simple. d be interested, if the building committee should think ve to justify confidence by obtaining opinion of more ric experts than I can pretend to give, and on case e for which I can supply the most reliable figures.

## THE PRESERVATION OF ANCIENT BUILDINGS.\*

(Concluded from last week.)

U to pass on to the wider question of structural stability. first of all, see to your foundations. Remarkable although rork was above ground, the Mediaevalists were sorry ns in the matter of foundations, and they seemed to ce no forethought as to the weight they proposed to put em. It follows that underpinning is a frequent neces- but remember that fissures may come from bad bedding a building above ground as well as from bad foundations. ors, bell-ringing is a frequent cause, and if the wall be krom any of these causes, and the underpinning un- ry, you incur much risk and may do much damage by ing it. I have been pressed to underpin the piers of a by my friends the Society because they were an inch or of the upright, when they certainly had never moved ge years, and an examination showed their foundations to ellent. Towards such importunity my advice is to do it but look pleasant. But having satisfied yourself about foundations, the next thing is to repair the cracks and con- the core of the walls. I need hardly mention the tyf liquid grout in this connection, but must warn you tise fresh cement. With a little care and skill grout may eployed so that no evidences of fracture need show. ation by blue bricks is pure faddism. Why, at the same f all time, display our own lack of skill and a building's ? But if you will do so, my advice is not to commemorate tablet.

W have often to deal with leaning walls. The idea that a i dangerous or necessarily going to fall because it leans absolute, if popular, fallacy. The mechanics of the are simple enough. Remove all lateral pressure and

the wall will not fall until the line of the centre of gravity passes outside the base. If the wall be buttressed, there is a still greater angle of safety. Our deductions will therefore be:— (1) Remove lateral roof pressure. (2) Consolidate and if necessary spread your foundations. (3) Spread your buttresses, or add new ones on a homogeneous foundation. (4) Let rebuilding be your last resort.

The disturbance of an ancient work and its architectural features by taking down and rebuilding is almost irreparable. Of course, it is frequently possible to set a wall upright by jacks, but the operation is costly, and demands the greatest care if the windows or other architectural features are dilapidated or fragile. Let us pass to the repair of stonework. We are now upon debateable ground. A beautiful work of art has been erected out of a friable stone, or, perhaps, the pestiferous atmosphere created by modern civilisation has been brought to play upon a stone which would stand quite well in the purer air of barbarism. The decay wrought has very likely added to the beauty of the building by softening its hard edges and giving sometimes that colour, sometimes that romance and glamour which are associated with weatherworn age. The building may, indeed, have reached the acme of its beauty, and yet the point may have been reached when disintegration will be rapid. A few years and the original touch of the mason's chisel will have vanished, together with all record of the contours he created. Is all record of these to be lost for ever to posterity? If the decay is such as to endanger the stability of the structure, is such renewal as may be necessary to take the form of the original, or must such imitative work be rigidly denied to us as a fraudulent proceeding? The panacea for such decay as I have described, advocated by the Protection Society, is whitewash. The panacea of the restorer is, of course, wholesale reconstruction.

Now, a committee of chemical experts and architects has been sitting for a prolonged period in the endeavour to discover some process by which the unfortunate decay in the stonework of Westminster Abbey may be arrested. Where such decay has taken place in stones of which the chief constituent is carbonate of lime, and where the cause is the sulphurous emanations from the modern town atmosphere, which convert carbonate of lime into gypsum, a soluble substance, an arresting remedy has been found in baryta-water (hydrate of baryta). You may see the effect inside the chapter-house, which has been dealt with under Professor Church's able direction. Unfortunately, in other places, where such a remedy was most needed, it proved a disappointment, and it is evident that it can be used only with the greatest circumspection. But the committee's report will be awaited with interest, specially if it determines for us the value of whitewash. If there are any of you who have been bitten by the craze for it, I ask you to hold your hand. To avoid prejudice against it, it is euphemistically dubbed "limewash" by its advocates. It appears to me in this connection that the special glory of an ancient building lies in the colour and in the texture of surface, which time alone confers. Place a fresh surface—a new film over it all—and you may acquire a different beauty—a new beauty—but it is only at the expense of the loss of the old. The texture and with it the sentiment have gone.

The argument is frequently used that as all or most old buildings were limewashed to make a surface for colour painting, to rewash them is legitimate. But surely this becomes restoration in the very sense in which it should be most obnoxious to the anti-restorer. The argument assumes also that a building is in its most-to-be-desired form when in the tentative state of preparation for painting, that the glory which even the greatest builders of old could not give, and which time alone can give to architecture, is as naught to be regarded. The cult of whitewash on old buildings is clearly not to be encouraged, gentlemen, and there is the truth of it. I cling to the fifth principle I have enunciated.

Professor A. H. Church in a communication to me says:—"My present conviction is pretty much as follows. Neither limewashing nor whitewashing is mechanically, chemically or artistically an appropriate treatment for the surface of decayed stonework possessing architectural merit. Some method is required which will involve no tendency to hide, to encrust and, finally, to bring down the rotten superficial layer. The preparation to be used should reconstitute, so far as possible, the cementing material of the original stone without greatly changing its aspect. It should be penetrative, of easy application, and should prevent further decay. Limewash possesses one merit only—so long as it adheres to the surface hostile agencies are thwarted. But it possesses scarcely any penetrative power; it does not appreciably reconstitute the cement of the injured stone, and it does not stop internal mischief."

Dr. Herbert Jackson writes:—"An application of limewash to decaying stonework undoubtedly tends to retard the decay to a certain extent. This is true both of sandstones and limestones which have been affected by sulphuric acid present in the atmosphere of towns. There are, however, reasons why the application of limewash is restricted in usefulness. One is

the difficulty of obtaining an adherent coating, with the result that unsuspected mischief goes on under the limewash, and is not perceived until it has proceeded far enough to cause large pieces of the stonework to become detached, together with the loosely adhering flakes of limewash. This difficulty may to some extent be overcome by using the limewash in the form of a very thin milk of lime and applying it two or three times in this weak state. Another reason why limewash fails to act in a very satisfactory manner is to be found in the properties of the compound formed by the action of sulphuric acid upon the lime. This compound (calcium sulphate) is sufficiently soluble in water to allow of its migration under the influence of drainage, and of its consequent accumulation in parts of the stone which are in a position to receive such drainage. In many cases this action has been proved to have been considerable and to have been the cause of much damage. Notwithstanding the disadvantages connected with the use of limewash, it is probably next to baryta water."

And what of the wholesale restoration? That, to my mind, is equally to be reprehended, and I adhere definitely to my precept No. 1. The stone, decayed though it be, which the builder laid there—be it blackened by soot or glorified by nature's paint-brush—has an intrinsic value and interest which can be given to no new stone which replaces it. I will never be a party to restoration for restoration's sake in the abstract. And yet where structural necessity demands it, the refusal to make the best record which can be made of the ancient work, and the demand that something different which will tell its own story shall be put in its place seems to me foolish and pedantic to a degree. Learn the true spirit of the old work by all the attention and assiduity you can command; respect it; work in it, if so be unfortunately you must; make a record of your copy; date every stone, or insert a recording inscription; but, believe me, you are fortunate—exceptional—if your new work will ever be mistaken for the old, or need recording otherwise than by its own existence.

The restorations which are the really sad ones, as they are also the most numerous, are those in which the keynote seems to have been the desire for newness; an unfeeling travesty of the ancient work has been substituted for it by some mechanic blind to the glory with which time has dressed it, ignorant of the spirit he has to deal with. It follows that he who is to be best trusted to deal with an ancient building is he who is most in sympathy with its spirit. The utter folly of the advocacy of the engineer as restorer, just because he has neither sympathy nor knowledge, stands apparent.

I should always myself advocate the employment of two architects in collaboration on any work of reparation, so that rashness or error or ignorance might be curbed in their effects. One of these should be a man who has proved his fitness, for no monument should be put in the hands of him who has to learn his methods upon it. But in any case I should like to see constituted an authoritative committee to whom the younger man—and his senior, too, for the matter of that—might come for the resolution, free of cost, of his doubts and difficulties. I believe there are many whose sympathies and abilities lie in this direction who would willingly give their time to such a duty. The organisation of the Society for the Protection of Ancient Buildings already exists, and, with my sympathy for its aims and objects, I would like to have suggested that body to fulfil the rôle. But can we urge confidence in a Society which has not restrained itself in the past from fads and fictions, and whose policy and procedure have gained a notorious reputation? I must hark back to attempt an answer to the query as to whether we owe it as a duty to posterity to preserve a record of the ancient detail of a decaying building otherwise than on paper; in other words, shall we let all features decay until all trace of detail is lost? The time may come when the stone decay is such that structural renewal is a necessity. Is posterity then to be unable to recover the form, if not the actuality, of what once existed? Dilapidation may be so advanced and rapid that either destruction or renewal stare us in the face. It may be our regrettable duty to preserve the record in stone of the form at least of some small portion of each variety of work, where necessity demands, even at the expense of the immediate appearance of the rest. But you may of necessity sometimes be called upon to add something new to an ancient edifice to take the place of what was once a part and parcel of its structure. Every remnant of a blocked-up window or doorway may be lost when it is wanted again on practical grounds, or a new buttress, perhaps, may be needed to stay a tottering wall. Then, I say, be reserved, be scholarly, be harmonious in what you design; be individual, but do not let your individuality be insane. I ask you again to observe the fifth principle.

Now the principles I have suggested for stonework apply generally to woodwork. Destruction and decay in woodwork is chiefly due to the original use of sappy timber. It takes between thirty and forty years for sappy oak to disintegrate, and it is well to note that the decay of sapwood is not like dry-rot; it does not injure or extend to the sound wood in imme-

diately contact with itself. Old timbers partially decayed by are not to be abandoned, therefore, for new (often pitch-pine) but to be scarfed by sound oak, and I do not hesitate to say that there are few ancient roofs, I care not how dilapidated, which could not have been repaired thus *in situ*, though without even removing the timbers to the ground, if sufficient skill and knowledge had only been at hand for the process. I show you herewith a view of the beautiful roof of Geddis, Lincolnshire. That roof was in the last stages of decay and dilapidation. The walls were pushed out and cracked in all directions. It was repaired without moving a single timber from its place. I can conceive no greater stigma attaching to an architect than that he finds it necessary to replace an old roof with a new one because the old one is seriously decayed.

Another point often comes before us—the dealing with the interior where modern three-coat plasterwork,  $\frac{3}{4}$  inch to 1 inch thick and more, has smothered the contours of the walls, and overridden or absorbed the quoin stones of the windows and other valuable features. I have even known a case where the not unusual thirteenth-century internal batter of the walls has been straightened out by plaster reaching a thickness of 5 inches at the top and absorbing a stone cornice. This is a come away of course. Obviously the consistent anti-restoration course would be to put in its place something which never existed before—to point up the rubble, for instance. But I am not so the Society in this case, and I heartily agree with you. You must replaster in a thin coat showing the irregularities of the walling. Your coat must not be smoothed down with a straight-edge. My custom is to put it on with a float and to brush it over with a big, stiff, flat brush about ten minutes after it is done. A satisfactory texture is thus secured, and in architecture it cannot be too often repeated, texture is all-important. In your windows recollect the vast importance of the stanchions and saddle-bars, and on no pretext allow the ancient ones which you find to be done away with. The glass-painter with too few exceptions, is the chief sinner in this matter. He has done our old churches inestimable damage, both by the loss of his wares and his application of them. But the old iron work has frequently itself done damage, and care must be used. If it has rusted in the stone it should be temporarily removed, the rust filed away, and while the surface is bright it should be reset in cement. Paint it then with two good coats of black oxide before it has its two final coats of black, and it will not give trouble again, but act as a permanent stay to the mullions and tracery. Stand out as far as you can against the protecting guards to stained-glass windows. Try to convince your clients of the advantage of a few fortuitous leads by a little of repair, after the inroads of an all too infrequently opportunist schoolboy's stone. If we could only get five-sixths of the modern stained-glass windows throughout the world, bested by what a gain it would be to our churches and to our peace of mind. Find that old wire-guards, with their suggestion of carpenter's Gothic, there at least not misplaced, make excellent chicken runs for the parsonage garden. Equally objectionable is the plating of windows with sheets of glass—a system which runs so conspicuously in York Minster, and suggests so forcibly deaconal blindness.

A word further of warning and I have done on this head. If you find cracks in your tower look to your bell-frame. A loose bell-frame is a too frequent source of mischief to a tower, but I do not thereby readily accept the bell-hanger's quite certain statement that an old bell-frame cannot be repaired, but must give way *in toto* to new. There are some remarkable ancient bell-frames in the country which it would be veritable vandalism to destroy, as, for instance, the one at Pitlington, near Durham. Now let us close the consideration of churches by briefly applying these principles to a hypothetical case. You are called upon to "restore" (that is the invariable word used) an ancient church. You will, in the first place, be wise to ascertain the general views of your employers—the incumbent, the warden and probably a restoration committee. You will have to adapt yourself to many diverse circumstances. You may meet genuine ecclesiologists and antiquaries, whose knowledge of the fabric and its history is ample and unique. To work with such is a genuine source of delight. Or you may have to do with enthusiasts in different degrees; those who would make the building conform to the most advanced modern ideas of church planning, careless how the requirements fit in with its past. Or there is the parson, full of enthusiasm and high purpose, who tells us his aims are "Gothic" (which, I warn you, may mean a hankering after some ecclesiastical catalogue). In such case I counsel tactful agreement, with a silent girding on of your armour of steadfastness. Or again, you will too frequently meet those who have a merely perfunctory regard for the beauties and history of the building, and whose only idea is to make it serve at the least possible cost; and finally those—comparable almost with the first I have mentioned—who will loyally do their utmost to second your efforts and adopt your advice. Of these, let me add, there are many, but never enough. In all cases your principles will be constant, but as your tactfulness in pressing them so will vary.

be in attainment. I am reminded of a charming and vicar whose first request to me was to spare him from "dile" about the history of his church. He cared not for all he wanted was to make it stable and useful at the post. I believe I satisfied his demands in every particular. I care to observe the historical demands made upon me or they happened to be the key of the situation, and I told that he now poses as the local archaeologist and reads the history of his church to interested visitors.

I assume, of course, your accurate general knowledge of the building from its earliest days, not only the main which are probably easy enough, but its gradual growth and change. Observe, first of all, the plinths; look carefully at the junctions in internal angles and their respective levels. You may find nave and chancel relatively of the same date, but the plinth junction may tell you which was erected first. Remember always that the doing away with, or the renewal of, the stone in such a position may wipe out for ever the traces of the building's development. Then look carefully at the straight joints in walls, which point with certainty to a plan, and note very exactly any differences of masonry. Then see if the windows are original or subsequent insertions. Our forefathers were skilful, indeed, at these insertions, whether of windows or whole arcades, and your most scrupulous scrutiny will sometimes be wanted. Discover also old floors and of ground. In excavating for the latter you may find any pieces of old leaded glass. I once discovered the link of a curious and interesting traceried window by the discovery of glass of an aperture buried in the earth opposite the window, which had been partially destroyed and built up. There are a few cursory ideas upon what may seem small, but which are sources of great help in the development of a preservation scheme.

A careful examination of roof timbers I have seen the way, without the slightest doubt, of the whole form of an old roof of varying dates, and nearly all its parts, which have been mixed up indiscriminately in an eighteenth-century reconstruction of quite a different form. Be careful of pitfalls. Remember that you may not have been the first called upon to put your will upon the building. There were restorers even in the early centuries, and many a history has been wiped out in endeavouring to make subsequent restorations into original work. I know of two curious columns in a fine church which, separated from the rest of an obvious Norman arcade, are regarded and honoured locally as the last remnant of an Anglo-Saxon fabric. They are clever insertions of the thirteenth century. Difficult elucidation will often be overcome by recognition of subsequent change. Then you have the question to face—what builder are you to employ? Almost certainly your committee will want competition among local architects. Now it is one of the misfortunes of modern methods that an architect cannot spend his whole time upon each of his works. We have to accept that inevitable difficulty. And we are perforce to do his work through the fingers of the local builder.

In the country the local builder builds cottages, the squire's mansion and executes the periodical repairs at the parsonage, and generally does the odd jobs of the district, with some drainage thrown in. I like him and like to employ him in his own line. Where his men gain the intricate knowledge to tackle the preservation of an ancient edifice, where tenderness and knowledge in every touch are essential? There are few, though few and far between, builders who have made it a hobby, and brought up intelligent foremen and apprentices to be experts in it. To such I acknowledge my indebtedness. Your business is to find such, to meet him on his own terms and arrange with him a fair price for the work. The work which has been done—absolutely irreparable—to our eyes by turning on the local builder and undertaker, even the churchwarden, is immense. With the soundest views and endeavours and instructions, the architect cannot overcome the ordinary workman's intrinsic ignorance. Here are the many pitfalls! I pray you take warning and avoid them. Competition in such work is pure madness.

Having completed your difficult undertaking and preserved your fabric in a thoroughly reverent spirit, you are now at liberty to advise as to its furnishings. Let me beg of you to preserve the form of preservation. Preserve it from the garish tile and meretricious brass lectern and all the blatant brasses of the cathedral glass in varied tints, the pitch-pine stalls and, and all those other elements of the taste which have been introduced since the Victorian era, and are the shame of the age. Preserve it also, or do all you can to preserve those in authority to preserve it, from the wiles and suggestions of the church furnisher and the indifferent glass painter, such as he from Munich—and the organ cases of the local builder. Do you not recognise the difficulty of your task? The general tenor of what I have said will apply to the whole class of buildings. I have already referred to the ruin on to use of the ruined Abbey of Dunblane. This was

a very exceptional case, and I cannot say that the result altogether makes one anxious of repeating the process in other possible cases. At the same time I hardly think it can be said that such work is to be deprecated altogether, if it be done with reserve and if it tends to the permanent preservation of the building. The danger comes if there be an inordinate and too likely desire to make all too spick and span, and to replace weatherworn stones, which may still be stable enough, with new, in the desire for neatness. The lovely colour the arcades have gained at Dunblane by exposure gives them a beauty they could never have otherwise acquired, and the architect has shown great judgment in leaving them severely alone.

In the adaptation of old buildings, other than churches, there is generally still greater temptation to interfere with their antiquity in favour of modern comforts. I know an antiquary whose delight it is to preserve ancient and dilapidated cottages from final ruin, and to make them once more serviceable for human needs; and it is surprising how well this can be done, and how simply and inexpensively where the taste is at hand. Such work can, I fear, only be done for love, but I trust none of you will shirk it for love if it comes in your way. This brings me to the third and last class of buildings. Ruins to be preserved as ruins. I have reserved till now the sixth principle—the destruction of ivy. Of course I shall be told that I am advocating the destruction of the picturesque, but it is not so. Quite apart from the destructive qualities of ivy—the entire concealment of architecture by any evergreen growth is merely the rendering of it valueless. It might as well be a rough brick wall, and any beauty such a combination possesses belongs to the ivy and not to the architecture. One is reminded of the seer of Brantwood's words, "The artist who looks to the stem of the ivy instead of the shaft of the pillar is carrying out in more daring freedom the debased sculptor's choice of the hair instead of the countenance." For the artist you may substitute the general lover of the picturesque and of antiquity, who is horrified when the parasitical growth has to give way to the exposure and preservation of its victim.

Of course, in the early days after ivy destruction your building looks bare and unclad, but take heart and counsel. Nature has provided a most happy substitute, which is as harmless as it is beautiful. You may plant *Ampelopsis veitchii* to any extent, the lovely light-hearted and fickle but always tender sister of the stern and solemn ivy. After two or three years of patient tending and watching the growth of a plant which has tested and likes its situation is almost phenomenal. You have the lovely daintiness of the spring leaves, the richness of the summer green and the glory of the autumn sunsets. And when the glory has departed all your architecture is revealed again, with the slender tendrils only adding texture to the walls.

At the highly interesting church of Westwell, near Ashford in Kent, a church where the thirteenth-century groining is done in concrete, this lovely creeper has been permitted to grow over the window glass, which it loves to do. The glass is fortunately transparent. The effect is more beautiful than any modern glass painter has ever conceived, and the contrast between nature's handiwork in glass painting and that of man in the east window, which alone is dim with unhappy saints, is striking indeed. I commend it to you. First, then, in the protection of a ruin, get rid of your ivy. The thick stems should be cut at about 3 feet distances and dressed with corrosive sublimate or any strong destructive chemical. The ivy must not be torn down from the face of the wall until it has lost its power of clinging, and should then be most carefully removed by the aid of scaffolding, and what is still more important, the aid of tender-handed and careful workmen. You will find frequently great ivy stems growing in the very centre of the walls, disturbing the core and pressing out the ashlar. There is no other course but to take out a stone or more, and destroy it by removing all that can be reached and killing the remainder. Again, you will have, perhaps, great dead ivy stems to deal with (for even ivy fulfils in time the course of nature) which have wrapped themselves round the ruin, and can hardly be displaced without disturbance of the stones. I cannot prescribe generally for such cases. They are sometimes most difficult to meet, and I can only recommend the ample use of scaffolding and shoring. I have known cases where the removal of the ivy meant necessarily the destruction of a small feature, such as a pillar. In that case alone the parasite must be allowed to stay and continue to sustain its victim until its life is lived. Posterity must then deal with it as best it may.

Obviously the most important duty is to protect roofless walls from the inroads of rain and frost. The method adopted at Kirkstall was to carry the irregular walls up to more or less the same level and cope with flat stones, slightly weathered. This, no doubt, is practically effectual if the coping-stone is good. But the sacrifice is very great. The building loses its picturesque claim as a ruin, and becomes formal at once. I cannot see that so drastic a treatment is necessary. It is quite possible to remove the soil and vegetation from the rough wall tops and grout them in with cement, leaving their irregular

contour, and it is only necessary to provide for carrying off the rain with fairly even distribution. A careful workman can do this under careful direction. There are those who are fearful of the use of cement in connection with old walls. Its danger consists in its improper use. It must be of the best quality and must be well aired before use, and not used too strong. The grouting in of cracks with cement, and if necessary the pointing with cement, can also be accomplished with no damage to the hoary antiquity of a ruin. In pointing, the generally earthy matter must be well raked out and the cement kept well back from the face. This can be done by means of a stick. Our forefathers were generally alive to the advantages of a sufficiently wide joint to allow of this. We come now to the difficult point of the treatment of reconstructions of an ancient building, necessary for its proper sustenance. Occasions arise where it is absolutely necessary to reconstruct part of an arcade, an arch, or a buttress, or perhaps a vault or some tracery. It appears to be an accepted principle, even by our keenest historic friends, that where old stones exist and their approximate position is known, they may be put back—reused. But the doctrine has been put forward and acted upon that, although you may build part of a feature with its old stones, you may not add to their number by new stones to the same section. A system has been adopted of cutting such added mouldings to an appreciably different section; for instance, at Kirkstall rounds or beads or bowtels are cut into facets. The principles adopted are not easily read. Apparently old square forms may be replaced by new square forms. Large rounds must be replaced by facets or chamfers, but small beads may be sometimes the same as the old, and sometimes cut into facets. Now I do not hold with this system. I protest strongly against it, for I believe it to be false in logic as it is injurious in effect.

The architecture of the building is ruined by the frittering away of its artistic forms in facets. To the uninstructed beholder, when the time has come for the new stone to weather as the old, the difference will mean nothing, but the artist's eye will be always offended. If you are afraid of falsifying history, there are two courses. Either rebuild in rough-hewn masonry, which will tell its tale, or copy the old as nearly as you can, but put a mark or date on each stone if you will leave some imperishable record of your work. It is easy enough. And, believe me, when the time comes—as it will come—that enlightened views on these subjects have prevailed and are general, if you act thus, generations to come will not laugh in their sleeve at you. Kirkstall Abbey furnishes an instance where the preservation of one of the most interesting ruins has been attempted in a thoroughly scientific spirit by an architect and antiquary who holds a foremost place in his own department. The first process was, of course, to clear away all ivy and other parasites, which made the ruin one of the most pictorially beautiful. Following this came the structural support of shaky parts, and the exclusion of water from the walls and groins, where such existed. I do not allude here to the excavations of heaped-up earth, which is a purely antiquarian pursuit, and ought to be undertaken as a matter of course in connection with work of preservation.

The process of protecting the walls from the weather has been, as already said, to carry them up in rough mason's work to a more or less continuous level, and cope them with a flat coping. Where architectural features, such as the external arches of the dorter windows, have been met with in the process, these have been rebuilt with narrow slabs of stone, so as not to be mistaken for ancient work. There is, however, one case where an old arch has been restored in its old form with new stone. I have already spoken of the faceted shafts and arch moulds, where it has been necessary to renew them. The carriage of the southern and part of the eastern side, all that remained of the shaky central tower, was the crux. The north-west tower pier and the nave arcade pier adjoining had fallen, and, of course, the north and west tower arches with them. The south-west tower pier had sunk, and the foundation was evidently insecure. Mr. Micklethwaite completes the disjointed nave, and with it the north tower arch, using faceted forms where old stones are not to hand. To assist the south-west tower pier he builds up the easternmost arch of the south nave arcade and the adjoining aisle arch, and to support the broken end of the tower adopts the bold expedient of erecting a detached pier adjoining the south-west tower pier. This new pier is an oblong block of dressed masonry with chamfered edges, merging in a very architectural manner into the upper portion of the structure.

Now this is thoroughly courageous work, and all courage demands respect. I could wish it had been possible to secure the foundation of the south-west tower pier (as would have been done if the building had been still in use), and thus allow the western tower arch to be thrown across as the northern one has been. Certainly the total result would have been more pleasing and the security greater. I fancy, too, that Mr. Micklethwaite will readily subscribe to my sentiment, "Don't build such a pier if you can help it." I must add my personal

opinion that if such a pier is essential, let it be in rough-hewn masonry. My view also shows the skeleton tracery introduced into the belfry. This, I think, will be an eyesore for all time. I had rather have seen some rough masonry erected to do the work of catching up the overhanging arched fragment, and proper reconstruction of the ancient window—duly recorded as modern, of course. The effect of the method of wall coping is best seen by the view of the east end of the chapter-house. I confess I have my doubts whether so disfiguring a treatment can be justified by any practical or archaeological necessity, avoiding counterfeits. It offends against my fifth principle.

Let me turn now to Bayham Abbey, where a similar but much simpler problem had to be faced. Here the endeavour was to preserve and protect the building as far as could be without altering its form in any way. Bayham is a monastic structure of singularly interesting plan and character. The ruins—and, I may add, the ivy—had reached such a point that great havoc had befallen during the last two or three years, when the owner, Lord Camden, alarmed by the recent collapse of a great part of the last remnant of the interesting choir clerestory, came to the rescue and determined to make the remainder safe. The ivy, of course, was dealt with, as I have already described, but the growth of such that this was no easy affair. Some huge dead branches were ready at any time to bring portions of the structure down. The roots had grown in the very centre of some of the walls and pressed out the ashlar on both faces. One buttress had to be built to sustain the tottering nave. This was done with rough masonry, and rough masonry was similarly to support a large overhanging piece of wall in the south transept. The tops of the walls were grouted in the fissures made good, and the pointing executed as I have described. Lastly, *Ampelopsis* has been planted, and I believe in three or four years only those who actually know what Lord Camden has done will be aware that any hand but nature's has been at work. Nevertheless, I believe the ruin is preserved for centuries.

In passing, let me say, never protect groining found in ruins with a wooden weather roof. Ruins are naturally neglected and such a roof wants attention from time to time. If left alone it decays and becomes an additional weakness instead of a protection. Use always permanent materials.

Gentlemen, the subject I have ventured to bring before you is not less difficult because barely two minds think alike on it, and I can but hope that my views will receive their measure of criticism. But I hope, too, it will be kindly, and will give me the credit of pressing before all else upon the keen resolution the doctrine of "hands off," of recognising an actual as well as a sentimental beauty in time-worn and time-honoured antiquity and of using my utmost endeavours to preserve what cannot be wiped out in an hour, and, like Humpty Dumpty, never picked up again.

But I must draw to a close. You may think that what I have said is elementary, and reminds you only of much that you have, or would have thought out for yourselves. So far as you disagree with the methods I advocate, I hope that you will at least admit that they are logical, and, above all, free from fads. The last man who should be entrusted with the care of the preservation of our ancient monuments is the man of the higher plane, and demands a broader view than lies within the horizon.

Mr. ASTON WEBB, A.R.A., who proposed a vote of thanks to the author for his exhaustive paper, said no one could have dealt with the subject more authoritatively than Mr. Caroe in his experience. No one could have dealt with it so courageously. The paper began by a quotation from John Ruskin, who was the great anti-restorer of his time, as well as a great lover of architecture, especially of old work. One of the greatest distinctions which the Association had received was that Ruskin chose that Society before whom to read his paper on the "Influence of Imagination in Architecture." In all that was said in that paper Ruskin was enunciating the principles dealt with by Mr. Caroe, that anyone who touched an old building must or should entirely efface himself. Though perhaps they had to blame themselves, and much of the criticism of the Society for the Protection of Ancient Buildings was correct, yet in comparison with the wholesale devastation which had taken place in France and Germany and other countries, England had come out of the ordeal of restoration more satisfactorily than those countries. No one in dealing with the subject could avoid referring to the Society for the Protection of Ancient Buildings. All must sympathise with the objects with which the Society was started. Mr. Caroe made an interesting point about the levels of churches and altars; this was often a difficult point, because the level of the altar was often insisted upon, and the lowness of the east end created a problem. The best way to get over the difficulty was to advance the altar and so raise it and the reredos independently of the east window altogether.

THACKERAY TURNER, secretary to the Society for the on of Ancient Buildings, said the paper made two criticisms against the Society, viz. that the Society was able for advocating the use of whitewash, and also that the use of blue bricks in the interior of buildings. e blue, he thought they were justified in trying to pre-building without interfering with the external aspect f the face of a building was touched in repairing there a loss, for they could not touch an ancient building a loss to it, but when repair was necessary they could en the building by taking out portions of the interior work and putting a material in its place which would with the outside face of the wall. It was an evil to do it it was a necessary evil. It did not matter what was used in this work; for it did not show, but blue ere convenient, for where cement was used it adhered firmly. The blue brick was also non-absorbent, and water did not quickly leave the cement used, which had e of setting slowly. As to the use of whitewash, he the reports of Professors Church and Jackson were not urable as to lead them to discard the use of white. He did not want to whitewash every building, and sh need not be used at all; it could be coloured. The considered it a lesser evil to white or colour-wash a than to let it go on decaying. It was the sulphur in atmosphere of towns which destroyed buildings, and if a ome was put on the stonework was protected, and when- essary a fresh coat of limewash could be put on. Professor BERESFORD PITE, who seconded the vote of said he was a little in doubt whether the Association t right body before which such a paper should be read. doubtful whether members of the Association would b likely to have old buildings to deal with, as old build- came fewer and fewer. The restoration of ancient itis seemed to be a highly specialised matter and did not go the work of an architect. The position of an archi- cied in to see an ancient building was anomalous, and difficulty which existed between the antiquarian and the veive elements was a chronic one. The repair and pre- ation of an old building was one thing, and the alteration th addition of new work to it was another, and when both oe done in the same operation and by one and the same e the same employer the difficulty was very great. h CHAIRMAN said the paper was of great interest to all . All took an interest in our old buildings and their rson. The more architects came into contact with the e, the more regret most of them would feel at having to ying to it, and the more carefully they would carry out eir or preservation when the work was necessary.

## ARCHITECTS AND QUANTITIES.

CASE was tried on Friday before Mr. Justice Ridley, in hich the plaintiff, Mr. W. Ralph Low, an architect and ti surveyor, practising at 10 Basinghall Street and e sued Mr. Thomas Tinnelly, a member of the Feltham o Board, to recover damages for slander. The main eci was privilege, and a denial that the words were ed. r Compston appeared for the plaintiff; Dr. Blake Odgers, d Mr. W. Clarke Hall for defendant. e appeared that the plaintiff was employed by the Feltham o Board to prepare plans and specifications and to take u quantities for the erection of a school for them, and accord- o is case, the specifications, as usual, provided that the e of the plaintiff for the preparation of the quantities itographing them should be paid by the contractor. The dit, it was said, on July 16, 1901, convened a meeting at r Board School, Feltham, which he hired for the purpose, at hich he spoke the words complained of. They were e fact that the contractor had to submit to a specifica- d down by Mr. Low, the architect, "by which Mr. Low is fees twice over, and no contractor gets a chance e submits to what I call a downright fraud." Mr. i was also said, got his fees from the Board and the r. These utterances were reported and published in t Middlesex Times, and plaintiff alleged that they con- at he had been guilty of fraudulent and dishonest e. The defence was a denial that the words complained spoken, that the provision of the specification as to the e being paid by the contractor for the preparation of quantities and lithographing was usual. Further, it was ed that the words bore the meaning which the plaintiff e and it was pleaded that they were, if spoken at all, e without malice, in the belief that they were true, and, e addressed to the defendant's constituents and ratepayers eham, were privileged. r Compston, in the course of his opening statement, iced that the defendant had written a letter, in the course hich he imputed that the reporter of the paper had con-

sistently misreported him and had a feeling against him. The learned counsel also said that the plaintiff did not bring the action to obtain money, and if defendant would apologise and withdraw the reflections he had cast upon him, the case might come to an end.

Dr. Blake Odgers said his client never had accused, and did not accuse Mr. Low of any form of dishonest conduct. More than that he could not say.

The plaintiff gave evidence, and a large number of witnesses were called in support of his case to prove the uttering of the words sued upon.

Dr. Blake Odgers, in opening the case for the defence, said there was a difference of opinion among architects as to the practice of members of that profession taking out quantities and being paid by contractors. The Institute of Architects laid it down that, when the work of taking out and supplying to builders quantities upon which the builder acted in executing the designs was undertaken by the architect, he should do so in concurrence with his client, and it was desirable that the work should be paid for by the latter rather than by the builder.

Mr. Justice Ridley said that was only a suggestion. Speaking from his experience as official referee, he did not think the learned counsel could find any explicit rule applying all over the country about it.

Dr. Blake Odgers did not think there was any special rule; he was only putting it as being the opinion of a large number of architects. The defendant did not say the words imputed to him about collaring fees twice over. All he said was that he objected to the architect having his fees paid by two people instead of one.

Mr. T. Tinnelly, the defendant, said he was a railway inspector and a member of the Feltham School Board. He took the view that all the architect's fees should be borne by the Board direct, and that he should have no fees from anybody else.

Mr. Clarke Hall then put to the witness the words complained of, and asked him if he uttered them.

Witness: I absolutely deny it on my oath in toto, or that I used any words which would convey that meaning. I complained that two clauses had been inserted in the specification whereby Mr. Low was to receive part of his fees from the Board and part from the contractor. My objection was to the two part-payments, and I said so. I have no personal feeling against Mr. Low.

Several witnesses were called, who bore out defendant's account of what he said.

Dr. Blake Odgers, at the conclusion of the evidence, submitted that the occasion was privileged.

The learned judge held that that was so, but declined to hold that there was no evidence of malice. There was, he thought, strong evidence if the jury believed that the defendant was not using the privileged occasion as such. If the defendant said that the plaintiff got his fees twice over he thought that was an abuse of the occasion. Therefore, the question came back to whether defendant used the words.

The jury, without leaving the box, said they found the words complained of were used, and that they exceeded the privilege of the occasion—that they were used recklessly rather than out of spite, and they awarded the plaintiff 50*l.* damages.

Judgment accordingly.

### The Keystone and Block Style.

SIR,—In former days, when the practice of relieving the walls of buildings by bands of stone of contrasting colour was imported by the late Mr. Street, this feature became so imitated and made, for a time, fashionable, that the system was jocosely called "the streaky bacon style." It had, at least for a time, an attractive appearance, but did not last long.

We have now, in the Renaissance of the Renaissance, a fashion which, I venture to suggest, cannot be considered anything but a disfigurement, and for which I would propose the above title. The unbroken sweep of the semicircular arch, seen from any point of view, is perfect in its grace and dignity; but the practice prevails of interrupting the arch with a central keystone. For this, although to my mind a disfigurement, there is no doubt ample precedent in Roman work, and a moderate and gracefully wrought keystone is comparatively harmless. This in the Renaissance was sometimes enlarged and rendered more obtrusive, and is now exaggerated out of all scale into huge unsculptured blocks, breaking up the arch with their ungainly harshness; then they become triplicated; then

similar unworked blocks stuck on all round the archivolt; then these disfigurements applied to horizontal lintels; vertical mouldings blocked out in a like manner, as if the builder, lacking moulding enough, and without the skill or means to cut more, had put the stones in in block, until now a whole building is marked all over with these deformities.

In your present number is an instance, although not so gross as some, yet sufficiently painful, where a simple but graceful design, as far as the upper storeys are concerned, is disfigured on the first floor by such blocks interrupting the horizontal architrave over the window-head, where it especially calls for the lightness of moulding that is used for the sides; but more gravely over the horizontal heads of the square upper windows, which, owing partly to the treatment of the architrave at the angles, but chiefly to the heavy triple blocks in the centre, really appear in your illustration to be breaking down under the weight of them.

In the revival of a style there is an unhappy tendency to adopt and exaggerate its defects, and in the now fashionable revival of a revival the same defective features are fastened upon, again exaggerated and more unsuitably placed.

In the development of the arch which graced the Byzantine, Romanesque, and other cognate work, the keystone is noticeably absent, with the best results. May we devoutly hope that this disfiguring fashion may speedily pass away, and that the keystone style may go the way of the "streaky bacon style."

I have been a long time hoping that some art critic might fasten upon this point, but architectural criticism appears to be almost lost, and no wonder now that architecture is a matter of evanescent fashion—Your obedient servant, F. WALLÉN.

96 Gower Street, W.C.:

April 18, 1902.

#### The Barbican Fire.

SIR,—The attention of the executive of this committee having been given to the Barbican fire of Monday last, which in many ways is a repetition of the worst features of the Cripplegate conflagration of 1897, we think it only right on this occasion to call the attention of the warehousemen and ground-landlords, as well as the public authorities controlling these areas and the insurance companies, who have considerable influence on building matters, that neglect is being shown even in the better class of warehouse buildings to the protection of the vertical surface occupied by the window openings overlooking thoroughfares, areas and courts, and that it is imperative that such openings in the vertical surfaces should be protected in some form or the other. This protection can be effected by using less flammable materials for window frames, in many cases by using fire-resisting glazing; and, further, by fitting the openings with fire-resisting shutters or blinds or by equipping them with drenchers. It is obvious that in the Metropolis the risk of fire spreading from house to house, across streets even over 40 feet wide (as in the case of the Barbican Fire) should be limited by preventive measures which, although not inexpensive, become absolute necessities in localities where the householder's danger is not a question merely of accident or neglect in his own premises, but where he has to be constantly on his guard against risk from his neighbours.

With more rapid measures—automatic or otherwise—of summoning the fire-fighting forces, and the instant use of first-aid fire-extinguishing appliances, the possibilities of extensive conflagrations would be more remote, and much that this committee must now consider necessary in the form of better building construction might perhaps be modified. But given existing circumstances, the importance of fire-prevention by better construction, and, more particularly, by a reduction of the spread of fire from house to house, is becoming even more essential now that the City population is decreasing, whilst mercantile structures are rapidly taking the place of dwellings.

We take the occasion to emphasise only the one serious question of the protection of vertical openings, although there are many other points which deserve attention, more particularly the protection of all ironwork by suitable covering; the avoidance of building materials which, when heated by fire, are liable to disintegrate on the application of water, improved forms of roof construction and the protection of skylights. But to deal in detail with these would lead too far.

We desire to point out that under the present circumstances of the Metropolis, the prevention of the spread of fire from neighbouring property is of far greater importance than in many other cities, and that means exist by which this risk can be reduced.—We are, dear Sir, yours very truly,

EDWIN O. SACHS, } Chairman.

ELLIS MARSLAND, } Hon. Secretary.

On behalf of the British Fire Prevention Committee.

Mr. Delissa Joseph, F.R.I.B.A., has removed from 17 and 18 Basinghall Street to larger offices in Portland House in the same street.

#### GENERAL.

Mr. P. E. Morris, A.R.A., died on Tuesday in his sixtieth year. Among his works were *The First Communion*, *Sons of the Brave* and *Fête Dieu at Dieppe*. Of late years Mr. Morris rarely exhibited.

M. Emile Bayard has found that a plate of celluloid can be used for the production of designs as a substitute for copper or lithographic stone.

The First Stone of the additions to the Paris Bourse will be laid some time during May. One of the objects to be deposited will be a plan of the building engraved on copper.

The Dover Corporation passed plans for the provision of municipal Turkish baths, involving an expenditure of over 2,000*l*.

Orders for Buildings to the value of over 200,000*l* are on hand in Bloemfontein, but cannot be started before the supply of labour is improved. Of this the Government works amount to 50,000*l*.

Mr. Alexander Grainger Linn, of Liverpool, who died on March 31 last, after making certain bequests, left the residue of his property in trust for the benevolent fund of the Institution of Civil Engineers. The late Mr. Linn's estate has been valued at 16,989*l* 9*s* 4*d* gross, and the legacy to the Institution of Civil Engineers seems likely to amount to 12,000*l* or 13,000*l*.

Mr. R. Norman Shaw, R.A., and Mr. G. F. Bodley, R.A., accepted last week the invitation of the Liverpool Cathedral Committee to act as their architectural advisers in the preliminary selection of architects and in the ultimate selection of a design for the Liverpool Cathedral.

The Bill authorising the laying of an electric tramway along the Embankment from Westminster to Blackfriars has passed the second reading of the House of Commons.

Mr. B. Andrew Little will read a paper on May 27 before the Society of Designers on "Design, its Demand and Supply in English History."

Two Alternative Routes are being surveyed in Kent for the purpose of a double-line electric railway between London and Dover. One route is via Maidstone and the other via Chatham.

The Local Government Board have refused the application of the Parish Councils of Freshwater and Totland to borrow 24,500*l* to carry out the drainage scheme of Messrs. Bennett & Masters. The Board recommends that the plans of Mr. Chatterton, M.I.C.E., be adopted by the Rural District Council.

The Annual General Court of the Incorporated Society for Building Churches will be held at the Church-house, Deans Yard, Westminster Abbey, on May 15, when the Bishop of London has consented to preside.

An Exhibition of black-and-white drawings by members of the *Punch* staff will be opened at the Woodbury Galleries, 37 New Bond Street, W., on May 5, the whole of the proceeds derived from admissions, by the kind consent of the proprietors of the gallery, being devoted to the funds of the Hospital for Sick Children, Great Ormond Street, Bloomsbury, W.C.

Professor Kuno Meyer will deliver to-morrow at Alexandra College, Dublin, the first of three lectures founded as a memorial to the late Miss Margaret Stokes. He will treat of the civilisation of Ireland, Pagan and Christian, from 4000 to 800 A.D.

Mr. Charles Davidson, who was one of the oldest members of the Royal Water-Colour Society, died on Saturday last in his eighty-first year.

M. E. Deshayes has delivered a lecture in the Musée Guimet, Paris, on "Fantastic Animals in Ancient Chinese Art."

The Plumbers' Company will confer the honorary freedom upon Mr. Andrew Carnegie at the Guildhall on May 14, in recognition of his munificent gifts for the promotion of education among all classes of the community. The presentation will be made in the Council Chamber at the Guildhall.

The Chantilly Museum, which was presented to France by the late Duc d'Aumale, will be opened gratuitously on Sunday and Thursday in each week until October 12.

The Bishop of London dedicated on Saturday All Saints mission church, Pentonville. The old church-building was formerly a cowshed. The new building was designed by Mr. R. A. Briggs, F.R.I.B.A., and built by Messrs. Campbell, Smith & Co., Ltd. The crypt is a gymnasium, and still shafts have been used instead of brick or stone columns for the supports of the roof. No expense has been incurred in decoration.

Mr. W. G. Wilson, A.R.I.B.A., announces that, requiring larger offices owing to the extension of his practice involved in his taking over the business of Mr. Edmund M. Bowyer, he has removed from Staples Inn to 24 Hart Street, Bloomsbury, W.C.

## EDITORIAL NOTICES.

*view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*Authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*Communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**AUSTRALIA.**—May 1.—Designs are invited from sculptors a memorial statue of Her late Majesty in marble or bronze. Information can be obtained at the office of the Agent-General for the State of Victoria, 15 Victoria Street, West-  
minster.

**COVE.**—Designs are invited by the board of management the L. & S.-W. railway servants' orphanage for a building (double-fronted) to accommodate 150 children (boys and girls). H. G. Warne, secretary, Jeffrey's Road, Clapham, S.W.

**HARROGATE.**—May 14.—Designs required for a new town hall. Premiums, 150*l.*, 100*l.* and 75*l.* Mr. F. Bagshaw, town engineer, Harrogate.

**HARTSHILL.**—June 16.—The committee of the North Staffordshire infirmary and eye hospital, Hartshill, Stoke-upon-Trent, invite designs for a home for nurses at Hartshill, Stoke-Trent. Particulars may be obtained on application to Mr. Herbert E. Boyce, secretary and house governor.

**KNARESBOROUGH.**—June 1.—The Harrogate and Knareborough Joint Isolation Hospital Committee invite competitive designs for an infectious disease (other than smallpox) hospital at Thistle Hill, Knareborough. Premiums of 100*l.* and 50*l.* are offered for the two selected designs. Mr. J. Turner Taylor, clerk, Municipal Offices, Harrogate.

**LEEDS.**—Designs are invited for the decoration and illumination of the exterior of the Town Hall, Leeds, to include flags, bunting and all fixtures, for which the cost must not exceed 200*l.* Mr. W. J. Jeeves, town clerk, Town Hall, Leeds.

**LIVERPOOL.**—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

**MEXBOROUGH.**—May 1.—The committee of the Mexborough Montagu Hospital invite plans for the erection of an accident hospital for both sexes, for the treatment of thirty patients, with the needful nurses and servants' accommodation. Premiums of 25*l.* and 10*l.* are offered, the premium awarded to merge in the commission. Mr. C. Brumpton, secretary, Fern Villa, Mexborough, near Rotherham, Yorkshire.

**SCOTLAND.**—April 30.—Designs are invited for a branch library for the Anderston district, Glasgow. Sir J. D. Marwick, town clerk, Glasgow.

**SUNDERLAND.**—Aug. 30.—Designs are invited for proposed police and fire-brigade buildings to be erected in Gill Bridge Avenue and Dun Cow Street. Premiums of 100*l.*, 50*l.* and 25*l.* are offered for first, second and third designs respectively. Mr. Fras. M. Bowey, town clerk, Town Hall, Sunderland.

**WEST HARTLEPOOL.**—June 27.—Competitive designs are invited for a new higher-grade school to accommodate 1,200 children, schoolkeeper's house, &c., proposed to be erected in Elwick Road, Eamont and Belmont Gardens, West Hartlepool. Premiums of 75*l.* and 35*l.* respectively. Mr. J. Robson Smith, clerk, School Board Offices, West Hartlepool.

**YORK.**—May 1.—Designs are invited for a Memorial to the late Queen Victoria to be placed in the Guildhall, York. The design must include a representation of Her Majesty, and be accompanied by an estimate of the cost of the work complete, such cost not to exceed 1,000*l.* A prize of 50*l.* (to merge in the commission) will be given for the accepted design. Mr. W. H. Andrews, town clerk, Guildhall, York.

## CONTRACTS OPEN.

**ASPATRIA.**—May 1.—For erection of two dwelling-houses at Aspatria, Cumberland. Mr. R. Berwick, architect, 35 Lawson Street, Aspatria.

**BARNSELY.**—April 29.—For labour and materials required in wiring and for providing and fixing the necessary electrical fittings to the Kendray hospital, the extent of which will probably be equivalent to 300 sixteen candle-power lights. Mr. J. Henry Taylor, borough surveyor, the Manor House, Barnsley.

**BARNSELY.**—April 30.—For erection of four houses in Sheffield Road, Worsborough. Mr. Arthur Whitaker, architect, Worsborough Bridge.

**BARNSELY.**—April 30.—For laying about 1½ miles of cast-iron socket pipes, 8 inches and 6 inches diameter. Mr. Henry Horsfield, town clerk, Barnsley.

**BEXLEY HEATH.**—April 28.—For the supply of tramway rails and accessories, and the supply and erection of engines, alternators, dynamos, &c. Mr. T. G. Baynes, clerk, Public Hall, Bexley Heath.

**FREE TO ARCHITECTS.  
PRACTICAL TREATISE ON  
HEATING AND VENTILATING  
APPLICATION TO THE  
TURTEVANT ENGINEERING CO. LD.  
QUEEN VICTORIA STREET, LONDON.**

**BLACKBURN.**—April 30.—For erection of premises in Darwen Street, Blackburn, for the Lancashire and Yorkshire Bank, Limited. Messrs. Stones & Stones, architects, 10 Richmond Terrace, Blackburn.

**BRADFORD.**—For erection of a branch bank, offices, &c., at Great Horton. Messrs. Jackson & Priestman, architects, Exchange Buildings, Bradford.

**BRADFORD.**—May 5.—For alterations and additions to the Lorne Street Board school, Wakefield Road, Bradford. Mr. Thos. Garbutt, clerk, School Board office, Manor Row, Bradford.

**BRADFORD.**—April 28.—For erection of litho printing works, Chapel Street and Scoresby Street, Bradford. Mr. Abraham Sharp, architect, Pearl Assurance Buildings, Market Street, Bradford.

**BRADFORD.**—April 29.—For erection of boiler-house and engine-house, with engine bed and boiler settings, &c., at Legrams Mills, Bradford. Messrs. Moore & Crabtree, architects, York Chambers, Keighley.

**BRIDGEND.**—May 2.—For erection of new kitchen, laundry, water-tank, boiler-house, &c., at the workhouse, Bridgend. Mr. P. J. Thomas, architect, Bridgend.

**BRISTOL.**—April 28.—For erection of school premises at Stillhouse Lane, Bedminster. Mr. W. L. Bernard, architect, St. Stephen's Chambers, Baldwin Street, Bristol.

**BURTON-UPON-TRENT.**—May 5.—For the following buildings and works, for the Corporation:—Labourers' dwellings; (contract No. 4) sewerage and making-up street about 150 yards in length; (5) erecting a block of 38 cottages; fire-brigade station and dwellings, new street, highways, &c., dépôt, Park Street, comprising stables for 12 horses, sheds, &c., and dwelling-houses; reconstructing Horninglow Canal bridge (1) brickwork, (2) steelwork. Mr. George T. Lynam, borough surveyor, Burton-on-Trent.

**CALLINGTON.**—May 7.—For erection of a Bible Christian chapel, Callington, Cornwall. Rev. J. Datson, Launceston Road.

**CHADWELL HEATH.**—May 3.—For erection of farm buildings at the Council's asylum, Chadwell Heath, Essex. Mr. Fred. E. Hilleary, town clerk, Town Hall, West Ham.

**CHARMINSTER.**—May 22.—For erection of a house for private patients on land adjoining the county asylum, near Charminster, Dorset. Mr. George T. Hine, architect, 35 Parliament Street, S.W.

**CHELMSFORD.**—May 1.—For erection of a pair of cottage near the railway station, Wickford, Essex. Mr. Frank Whitmore, architect, Chelmsford.

**CHELMSFORD.**—April 28.—For repairs, painting, &c., at the union-house, Wood Street. Mr. W. W. Duffield, clerk to the Guardians, 95 High Street, Chelmsford.

**CHESTERFIELD.**—May 8.—For erection of new stores, &c. at West Bars, Chesterfield. Mr. Geo. Haslam & Son, architects, Euclid House, Ilkeston.

**COLCHESTER.**—May 7.—For extension of the boiler and engine houses at the electric-light station, Osborn Street. Mr. Herbert Goodyear, borough engineer, Town Hall, Colchester.

587 & 589 HARROW ROAD, PADDINGTON,

**WESTON-SUPER-MARE.**—May 6.—For erection of an additional ward, &c., at the fever hospital, Uphill Drove Road, Weston-super-Mare. Mr. Hugh Nettleton, surveyor, Town Hall, Weston-super-Mare.

**WHITLEY BAY.**—April 30.—For rebuilding premises in Whitley Road and Esplanade, Whitley Bay, Northumberland. Mr. F. R. N. Haswell, 77 Tyne Street, North Shields.

**WINDHILL.**—April 28.—For erection of six terrace houses at Park Terrace, Windhill, Yorks. Mr. Wm. Wilcock, architect, 9 Leeds Road, Bradford.

**WORTLEY.**—May 1.—For laying 2,147 yards of 12-inch and 9-inch stoneware pipe sewers, with usual manholes, &c., and also the laying-out of about 2¼ acres of land as a sewage farm, the construction of settling and sludge tanks, fencing, road making, store sheds, &c. Mr. William Dransfield, clerk to the Rural District Council.

AN interesting discovery has been made at the island of Capri consisting of, it is supposed, an underground vault in which the Emperor Tiberius used to confine the victims of his displeasure prior to their being thrown into the sea. The walls are covered with inscriptions, some of which go to show that among those immured subsequently in the prison were the sister and wife of the Emperor Commodus.

A NEW Church house was opened at Wokingham, Berks, on the 9th inst. The new building is situated in the East Hampstead Road, not far from All Saints Church, and is a commodious structure, built from the designs of Messrs. Joseph Morris & Son, architects, Reading, by Mr. E. C. Hughes (the present mayor of Wokingham), in the most thorough and substantial style. The block contains as its principal feature a central hall about 45 feet by 30 feet, which has a dado of specially glazed and coloured bricks, an open hammer-beam roof and pitch-pine wood-block floor. The heating is with hot water by means of radiators, and there are also fireplaces for open fires, lined with salt-glazed brick on the Teale principle. All the woodwork and joinery is stained and varnished. Other accommodation comprises a committee-room, a tea-making room with stores, and lavatories and other conveniences. A covered porch leads to the offices, &c., and the main entrance to the body of the hall, for meetings, &c., is by an oaken porch. A caretaker's cottage and workmen's refreshment room are to be erected on an adjacent site which has been presented by the rector.

## TENDERS.

### AMBLE.

For erection of a club at Amble. Mr. GEORGE REAVELL, jun architect, Alnwick.

R. CARSE & SON, Amble, Acklington, Northumberland (*accepted*) . . . . . £1,710 6

## ELECTRIC NOTES.

THE Earl of Jersey, G.C.B., presided at an inquiry by the Light Railway Commissioners with reference to an application by Sir William Crundall, Sir John Jackson, Sir Weetman Pearson and other influential gentlemen to extend the Dover electric tramways into the country in the direction of Kearsney Abbey, and also along the East Cliffe towards the holiday resort of St. Margaret's. Mr. Dickens, K.C., counsel for the promoters, declared that with the construction of these tramways and the completion of the great national and commercial harbours Dover would develop enormously, and become not only one of the most important, but also the most attractive town along the coast. Sir John Jackson, one of the promoters, considered that with the inauguration of the scheme and the erection of high-class residential houses along the cliffs the sea-front would equal, if not excel, the Folkestone Leas. Other witnesses endorsed the opinion, it being emphasised that the view from these cliffs was unparalleled. From it the cliffs at Calais were discernible. It was announced that the scheme would cost over 60,000£, and it was supported by practically all the public bodies in the town and district. After a lengthy hearing, the Commissioners announced their intention to recommend the Board of Trade to sanction the schemes almost in their entirety.

COLONEL DURNFORD, R.E., Local Government Board inspector, held an inquiry at the Stretford District Council offices in regard to the application of the District Council for leave to borrow 54,000£, in order to provide the district with an electrical supply for lighting and traction. Mr. T. Johnston, chairman of the electric-lighting committee, stated that he con-

sidered there was a great demand in the township for electricity. Mr. Abraham, clerk to the Council, said there were 6,900 houses in the district, of which 670 were rented at 10s. and upwards. Five years ago the population was 30,436, and the rateable value in 1897 amounted to 143,156£, and to-day the total was almost double, being 280,445£. The development of the district had been general. Industrial development had taken place to a great extent in Trafford Park. There were 8½ miles of tramway, and the trams were at present worked by the Manchester Carriage and Tramways Company. The Council had given notice to the company to purchase the tramways. The arbitration on the purchase price was held some months ago, and they were now waiting the award. C. H. Wordingham, electrical engineer, said there was a great demand for the supply of electricity in the district. After considerable opposition the inquiry closed, the inspector intimating that he would report to the Local Government Board, where a decision would be received in due course.

THE North-Eastern Railway Company are about to utilize the well-known "Coopkarnal" waterfall of the river Easington, which passes under the railway from Darlington at a point close to the Kirkby Stephen station, for the working of a turbine and dynamo to supply an extensive electrical installation at the railway station and mineral sidings at Kirkby Stephen. The current will be conveyed overhead to a large battery in the station buildings, and will be distributed to the various lights, motors, &c., through armoured underground cables. It is intended to supply the station offices, workshop, locomotive sheds, signal cabins and signal posts with the electric light, whilst the cattle mounts, points and turntable will be lit by means of arc lamps on iron poles. An electric luggage lift is also to be fixed, and an electric motor will replace the present steam-engine for driving the machinery in the workshop, a motor being so arranged that it can be driven as a dynamo from the old steam plant, and so keep the accumulators charged should the water supply fail.

FOR some time negotiations have been in progress between the tramways and the electricity committees of the Corporation of Glasgow with a view to the latter taking from the former a surplus supply of electric power produced by them. An agreement has now been come to under which the electricity committee agree to take a maximum of 50,000 Board of Trade units per annum, while the maximum demand is not to exceed 1,800 kilowatts, and not to be less than 1,500 kilowatts for the

# The "ONE" Range.

PATENT 1331/01.

M. F. CO. LD. R.

These Ranges are Exhibited by the following London Firms:—

R. ADAMS, Newington Causeway;  
CLARK, HUNT & CO., Shoreditch;  
O'BRIEN, THOMAS & CO., Upper Thames Street;  
R. H. & J. PEARSON & CO., Ltd., Notting Hill Gate;  
ROWNSON, DREW & CO., Queen Victoria Street.

Agents for Liverpool:—

THE WELL FIRE CO., Ltd.

The above shows the heat concentrated under the boiler and the waste heat passing under the hot plate.

This Independent Range is fitted with hot water circulating boiler, as shown in the sections, and the heat of the fire passes direct under the bottom of the oven.

A Fire Brick Dome and damper is fitted over the fire, which enables the heat to be concentrated at pleasure on the hot plate or boiler, the waste heat of either passing under the other, thereby utilising what is usually lost.

The above shows the heat of the fire concentrated on the hot plate and the waste heat passing under the boiler.

The casing and oven door are lined with slag wool and a third oven can be arranged if required.

THE BANK, LIVERPOOL: TELLING ROOM. DETAILS.

WESTOVER, MILFORD-ON-SEA.

The plant is at work, it being understood that it will only be used for the heavy peak load of the winter afternoons, running over a period of from a half-hour to 2½ hours. The power is to be taken from the Coplawhill sub-station into the Electric Works. The Tramway Department is to charge 1½d per unit plus 5 per cent. per annum for the capital expenditure necessary for the transference of power, which may amount to 1,800l. The total annual cost is estimated at 1,023l., while the electricity committee expect their net saving at 20,000l. The agreement is for 25 years from the 31st prox., and thereafter to be terminable on 12 months' notice being given by either committee. It may be noted that the Tramways Department have no expectation of being able to utilise for at least 10 years the power which is being sold to the Electricity Department.

## TRADE NOTES.

The Pancras Ironwork Co., Ltd., have just completed the erection of the new iron and glass covered way at the Theatre, in connection with the alteration of the levels at the Savoy Hotel and the Strand.

The Chipping Hill School, Witham, Essex, is being heated and ventilated by means of Shorland's patent Man- grates, supplied by Messrs. E. H. Shorland & Brother, Manchester.

The ventilation of Westfield public school, Westfield, Wiltshire, has been carried out by means of Mackay's direct-acting ventilators, supplied by the sole makers, Cousland & Mackay, ventilating engineers, Glasgow and Manchester.

The Fireproof Partition Syndicate, Ltd., of 10 York Buildings, London, E.C.4, the makers of the dovetail corrugated metal- ing partitions, have lately erected under Messrs. Thos.

Aldwinckle & Sons (architects), the fireproof partitions at the Gore Farm Small-pox Hospital, Dartford. The partitions were put up in an amazingly short space of time, surprising architects and builders alike. The firm are also, under the same architects, erecting partitions at other small-pox hospitals.

THE "Cyclo" machine for whitewashing and painting large surfaces, such as the walls and roofs of factories and warehouses, has recently been introduced by Messrs. Thomas Harrison, Ltd., Thornton Road, Bradford. It consists of a strong barrel or drum on wheels, an air pump and a length of small hose with a special nozzle, which delivers the whitewash or paint in the form of a fine spray. It is claimed that one machine will cover as much surface in the same time as could be done by ten men using brushes, and the fine spray being directed to and entering every nook and crevice insures the work being better done. The machine is complete in itself, carries its own paint and is very portable.

## BUILDING AND BUILDERS.

AT a meeting of Dumfries School Board on Tuesday estimates were accepted for alterations at St. Michael's Street school, involving an expenditure of slightly over 3,000l.

THE Bridlington Town Council have decided, by ten votes to seven, to apply to the Local Government Board for permission to borrow 37,000l. for sea-front improvements, including the extension of the Prince's Parade.

THE foundation-stone of the new mission church of the Good Shepherd, Small Heath, Birmingham, was laid on Tuesday. The new church, which will be erected in the English style of architecture of the fourteenth century, is estimated to cost 8,000l.

THE engineering department of the North British Railway Company are engaged at present erecting a new station at Camelon, which is intended to serve the inhabitants in the west end of Falkirk. It is expected that the new station will be ready for opening in the course of the next few weeks.

AT a meeting of the Doncaster Rural Council on Tuesday, Messrs. D. Balfour & Son, C.E., were instructed to complete the schemes for the disposal of the sewage of Askern, Bawtry and Bentley, with estimates, and to apply to the Local Government Board for their sanction to loans for carrying out the works.

Council Chamber at Hemel Hempstead, fitted and furnished by HEWETSONS.

THE foundation-stones were laid on Saturday afternoon at Bradford of a new Primitive Methodist chapel, which is being erected at the top of Smith Lane, Daisy Hill. It is estimated that the new structure, which is designed in the Gothic style of architecture, and is to seat over 500 persons, will cost about 2,000*l*.

AT the annual meeting of the Guardians at Stratford-on-Avon tenders for the erection of a new infirmary in connection with the workhouse were opened. Altogether twenty-two tenders had been sent in, and ultimately, on the proposition of the chairman, that of Mr. George Whateley, of Stratford, was accepted, the amount being 3,540*l*.

THE Bill confirming a provisional order of the Local Government Board, which extends for three years the period allowed for the construction of the marine drive and promenade along the North Bay, Scarborough, has passed through committee, and was ordered to be reported, without amendments, to the House.

THE Building Act Committee of the London County Council has been directed to report as to an amendment of the Building Acts with reference especially to (a) the constitution of the tribunal of appeal; and (b) the powers at present possessed by landowners under certain circumstances to cover open spaces to the public detriment.

THE Edinburgh Town Council have resolved to acquire the Synod Hall premises at a cost of 30,000*l*. for the erection of a city hall, for which the late Mr. Andrew Usher bequeathed 100,000*l*. Mr. J. A. Williamson, Deputy-Superintendent of Public Works, prepared a series of draft plans to assist the Council in arriving at a decision.

THE foundation-stones have been laid of a new Wesleyan chapel at Bradley to replace that which was destroyed by lightning some eighteen months since. The estimated cost of the new edifice is 4,600*l*. The building, which is in the Gothic style of architecture, will accommodate when finished 620 persons—about the same number as its predecessor. The architect is Mr. C. W. D. Joynson (Wednesbury), and the builder Mr. W. T. Lees (Darlaston).

LAST May, Leigh, Atherton and Tyldesley plasterers, numbering about forty, went on strike because the masters refused to advance their wages from 9*d*. to 10*d*. an hour. Some months later the men offered to resume work for an immediate advance of 3*d*. per hour and another 3*d*. in six months. This also was refused. Representatives of masters

and men met on Tuesday at Court's Hotel, Leigh, and the agreed to immediately resume work at the old rate of wages and work with the men imported from elsewhere. Masters agreed to reconsider the wages question in November. Work has now been resumed.

THE Dundee authorities have approved of plans for erection of a bridge over the Caledonian Railway line at west end of Dundee to connect the extended esplanade Perth Road at Ninewells, and these are now awaiting formal assent of the railway authorities, with whom the negotiations have been satisfactorily carried through. The bridge will be sufficient to carry vehicular traffic, and where it is built a most convenient outlet from the west end of Esplanade will have been provided, and the traffic from west end to the centre of the city, which at present passes Perth Road, will be better distributed.

AT the annual meeting of the Colwyn Bay District Council held on the 17th inst., the chairman reported that a committee of the Council had secured a splendid site on the Con Road, in the centre of the town, one acre in extent, for purposes of municipal buildings, and he suggested that designs be invited from the "best architects in the kingdom" for buildings, premiums of 60*l*., 40*l*. and 20*l*. respectively be offered for the three best designs. It was unanimously decided to apply for the sanction of the Local Government Board to carry out the scheme and to raise loans for the purpose, purchase to be completed by November 1.

THE new schemes of the North-Eastern Railway Company for the improvement of the Hartlepool dock accommodation include the removal of the present quay between the harbour and the Victoria Dock, affording at high-water spring tides the uniform depth of 24 feet. Fish quay accommodation will be provided on the east and south sides, and the staiths will be supplanted by new ones on a scale capable of lifting 40 tons at once, suitable provision being made for smaller vessels. A new dock will be constructed near the Central Dock, so that quay room may be added as required. The south quay will be 1,550 feet long and 150 feet wide, and the west quay 350 feet long. The east end of the dock will have equal depth with the Central Dock, and be devoted to use of the timber trade.

THE town clerk of Harrogate has received the draft provisional order of the proposed sewerage scheme which forms the subject of a Government inquiry at Harrogate a short time

DON'T USE IN FROSTY WEATHER.

ESTABLISHED 181

Originally the Corporation decided to go in for a comprehensive scheme and treat the whole of the sewage of the town at disposal works at Ribston, six or seven miles away. On receipt of the report of Mr. Fox Strangways on the state of the district, the big scheme was dropped, and it was decided to take a portion of the sewage to the north side of the town and the remainder to Ribston. For this purpose works have been scheduled in the parish of Killinghall, and in the borough of Harrogate, and half an acre in all, at a total of 86½ on the north side. On the south side works are scheduled—83 in the parish of Spofforth and Little Ribston.

New municipal offices are shortly to be erected in Dorking. They are to comprise a post office, a suite of rooms and a chamber, of which the Urban Council will become the owner, and a pair of shops. An attractive block of buildings has been designed by Mr. W. J. Shearburn, architect, of Dorking, and the structural portion of the work has been entrusted to Messrs. A. J. Thompson & Co., of London, at a cost between 7,000*l.* and 8,000*l.* The post office will have a frontage, one to South Street and the other to Junction Road, the entrance to the public department being at the latter. On the ground floor are provided postmen's rooms, and messengers' offices, &c., with a sorting-room 42 feet long, with lantern light along the top. At the lower end is a van entrance in Junction Road, communicating with a sorting-room. In the basement are the battery-rooms, &c., the instrument-room being located on the first floor. The council offices are situated over the post office, and comprise a committee-room, clerk's department, surveyor's office, &c., together with a council chamber, 38 feet by 28 feet, this suite of rooms a separate entrance will be obtained from South Street. A pair of double-fronted shops form the frontage of the scheme, and over these will be constructed the residences, consisting of dining-room, drawing-room, kitchen, scullery, pantry, &c., five bedrooms and bathrooms, and cold water.

Mr. H. H. LAW, C.E., held an inquiry on the 22nd inst. on behalf of the Local Government Board at the Town Hall, Dorking, on-Trent, into the application of the Town Council to the Local Government Board for works of sewerage at Stapenhill and Dorking, 1750*l.* for a machine stoker at the pumping station, 1750*l.* for provender machinery at the sewage farm. Mr. J. Gregory (barrister) appeared for the Corporation,

and Professor Dewar, together with the officials, was also present for the local authority. Stapenhill and Winhill are portions of the borough on the east bank of the Trent, with a population of 10,000, but the locality is unprovided with any proper system of sewerage. The present scheme has been in hand for many years, but has been held in abeyance on account of strenuous opposition. It was anticipated that much opposition would be shown at the present inquiry, but only Councillor Croad appeared as opponent, and explained that he was so present at the request of ratepayers. It was explained that the scheme for which the money was required would provide for 25,000 people—the estimated population in 1941. The sewage would be taken under the river Trent and discharged on to the farm at Egginton, six miles away. After some remarks from Councillor Croad, the inspector said he was bound to inform the latter that the Corporation had an area, containing at least 5,000 people, which was quite unsewered, and the sewage passed through the watercourses and so into the Trent. That was altogether illegal, and the Corporation were bound to alter such a state of affairs. Having intimated his intention of visiting the site of the proposed sewerage works and the farm, the inspector declared the inquiry closed.

### VARIETIES.

THE Capital and Counties Banking Co. are erecting a new bank at Chelmsford. The architects are Messrs. Clare & Ross, of West Street, Finsbury.

FOR the new school which is about to be built at Muswell Hill for the Hornsey School Board, Mr. J. Farrer, of Coleman Street, London, has been appointed architect.

THE annual meeting of the Norfolk and Norwich Archaeological Society was held at the Guildhall, Norwich, on Friday last, General W. E. G. Bulwer, C.B., presiding over a large number of members.

MR. C. HARSTON, F.R.I.B.A., of Bexley Heath (and of Messrs. A. & C. Harston, architects, Leadenhall Street, E.C.), was at the Easter sessions at Maidstone sworn in as a Justice of the Peace for the county of Kent.

THE new Wesleyan school at Hallroyd, Shipley, which has been built from the designs of Messrs. Danby & Simpson, of Leeds, is now open. The building, which has cost 3,200*l.*, will

be used also as a chapel until the completion of the big scheme, which is estimated to cost 14,000/.

AT Tuesday's meeting of the Paddington Borough Council, Mr. Arthur W. J. Russell, assistant town clerk, was promoted to the office of town clerk at a commencing salary of 700/ per annum, in succession to Mr. Frank Dethridge, who retires at Christmas next.

AN inquiry has been held in Dublin relating to an application of the Dublin Corporation for a loan of 10,000/ to enable them to make advances to borrowers under the Small Dwellings Acquisition Act, and a loan of 25,000/ for the erection of a central fire-station at the corner of Tara Street and Great Brunswick Street.

THE chancel of the church of St. Luke the Evangelist, Burton Lane, York, was consecrated on Saturday afternoon by His Grace the Archbishop of York. This portion of the church has been erected at a cost of close upon 3,000/, and will seat 300 worshippers. When the whole scheme is completed and the nave erected there will be seating accommodation for 800 people, and the total cost has been estimated at 8,000/.

THE Bishop of Gibraltar consecrated on the 5th inst. the church of St. John the Evangelist at Smyrna. The Consular church was a few years ago pulled down, and after the chaplaincy had ceased to be a Consular one the British community built a new church near the Aidin railway station. The honorary architect was Mr. S. Watkins, engineer of the Ottoman Railway Company. The church is in the Early English style, consisting of a chancel and nave without aisles.

THE South parish church, Greenock, after having been closed for several months to allow of extensive alterations being carried out, has now been reopened. Most of the improvements have been carried out at the eastern portion of the building, and these include a new chancel, with a stone traceried window to be fitted with stained glass, a new oak pulpit, a transit exit staircase from the church, two large classrooms, vestry, &c. The scheme has cost about 2,000/, and an increased accommodation of 200 has been given.

THE King's reconstructed private apartments at the Epsom grand stand were on Tuesday, the 22nd inst., used by His Majesty for the first time, together with the new electric passenger lift, which will henceforward probably prove to be the most favoured approach. This is the first occasion on

which a modern luxury of this character has been provided such a situation, and it is noteworthy that the machine benefits its purpose, is entirely of British design and manufacture. Its construction was entrusted to Messrs. A. Smith & Sons of London, and the lift was under the personal charge of Messrs. Major and P. H. Stevens on behalf of the manufacturers.

THE 1902 issue of the "Advertisers' Ready Reckoner" (C. J. Walker, 24 Coleman Street, E.C.) contains a number of new features, amongst them being:—The country section, showing the prices charged for advertisements in the leading country weekly newspapers. Specimen types, with their names, &c. A measuring scale showing the number of lines to the inch set close from bourgeois pearl. An industrial map of England and Wales showing where English and Welsh industries are carried on. Population statistics of the United Kingdom. An article on "How to Achieve Success in Advertising." Hints on "Ad Writing." A ready reckoner showing total cost for a series of advertisements of from 6 to 312 insertions at prices varying from 6 10s. per insertion, &c.

WHILE some building operations were going on at the Royal Hotel, Temple Row, a portion of a brick arch fell in, revealing an ancient well. A man who was working at 6 inches from the spot had a narrow escape. The well proved to be about 103 feet deep, and it is splendidly built, well served and remarkably clean. It is lined with bricks such as were used 300 years ago, and are not made now. Only 14 feet away is another excavation, which appears to have been used for depositing refuse, and indicates a curious idea of sanitation that once prevailed. Another discovery of interest to antiquarians was the unearthing of portions of pebble paving a few inches below the floor of the scullery, which is supposed to have been a courtyard in the old coaching days, when the Royal was an important house of call.

A NEW fire-station was formally opened at Stockport on the 10th inst. It occupies a very central position in Market Square, from which point main roads radiate to all parts of the town. It is the centre of the electric tramway system, and car-sheds are in the rear of the new building, and central tramway offices are to be erected with frontage in line and harmony with the fire-station. A conspicuous feature of the new structure is a drying tower, rising to a height of 100 feet. The style of the main building is Gothic, faced with Accrington stock bricks, with Scotch redstone dressing; the main entrance

5 Laurence Pountney Hill, Cannon Street

of stone, carved with the arms of Stockport and other emblems. The building is divided into four blocks, engine-house, stables, firemen's dwellings and work. The cost has been about 12,000/.

the 12th inst. Inchinnan parish church, near Renfrew, being completely renovated, was reopened for worship. The renovation is being carried out at the expense of Lord Rowand, and it will cost over 15,000/. Dr. Rowand, Edinburgh, was entrusted with the work of renovating the style of architecture chosen is fifteenth-century Gothic. The portion of the building opened on consists of a choir 22 feet in length, a central tower square internally, with north and south transepts and a choir organ chamber above. The nave is to occupy the site of the old church, and its reconstruction will be completed immediately.

A new branch library, erected from designs by Mr. Percy W. Wainwright, Leeds, at the corner of Stock's Hill and Wesley Street, Armley, Yorks, was opened on the 17th inst. The new building is surmounted by a clock tower of bold design. The reading-room is 60 feet 9 inches by 76 feet, and is lighted by windows on either side, and a double range of ornamental lights in the curved and panelled ceiling. All the fittings and furniture here have been specially designed by the architect. Under the main reading-room is a reading-room 22 feet 9 inches by 36 feet, for the use of boys and girls. The building is equipped with some 8,000 volumes, is a fine feature of the new building, with its glass dome and its designed bookshelves and galleries. There are also comfortable ladies' reading-room and a librarian's room.

On the 13th inst. the Senior Prebendary of Durham, Canon Tristram, D.D., dedicated a very handsome altar presented to St. Cuthbert's Church, Durham, by Mr. A. H. Shiel, of Snipeley Hall, as a memorial to his two sons, Mr. J. H. A. Shiel. The design is by Mr. C. H. Fowler, eminent ecclesiastical architect of this city, and the work was carried out by Mr. Milburn, of York. Bath stone was used for the foundation of the reredos, cream alabaster the frame, whilst the panels are of Dumfries pink stone. The inscription on the reredos is as follows:—"To the glory of God in loving memory of Hugh Angus Shiel, born 31st March 1882, and died on October 26, 1900; and of John Angus Shiel, his brother, departed this life at Snipeley Hall, in his 4th year, on November 5, 1894."

THE new nurses' home which has been erected at Gravelly Hill, Birmingham, in connection with the Aston union workhouse is now open. The building has been constructed to plans prepared by Messrs. C. Whitwell & Son, of Birmingham, by Mr. T. Johnson, builder, of Great Brook Street, at a cost of 9,900/. It occupies a position facing Feltham Road, to the south of the infirmary buildings. Accommodation is provided for upwards of forty nurses. On the ground floor the eastern end is given over to the rooms that will be occupied by the medical officer and steward, and to the west of the entrance hall there is the superintendent nurse's room, and the rooms of the other nurses and probationers, with the usual rooms for meals, kitchens, &c. On the first floor there is the sleeping accommodation for the medical officer and steward, and bedrooms for forty-two nurses are on the top floor. The heating is by hot-water radiators.

THE monthly meeting of Glasgow Archaeological Society was held on the 17th inst. in the rooms of the Society, 207 Bath Street, Principal Street, presiding. A paper by Professor Medley on "Wayfaring Life in the Middle Ages" was read by Mr. W. G. Black, hon. secretary of the Society. The paper described the roads that were in Britain in the Middle Ages, and afterwards passed on to tell of royal journeyings, caravans, the character of the different classes of travellers, the jugglers, minstrels, robbers, hermits, friars, pardoners and other types of people who spent a large part of their time on the road. Afterwards Mr. Charles E. Whitelaw read a paper on "The Origin and Development of the Highland Dirk," in the course of which he described in detail, and with the help of illustrations and specimens, the many different kinds of dirks which have existed and which now exist.

THE accounts of the London and Lancashire Fire Insurance Company for the past year, to be presented to the shareholders at the annual general meeting to be held on the 30th inst., have just been issued. The net fire premiums amounted to 1,134,214/., and the net accident premiums to 39,550/. The underwriting surplus on the working of the two departments amounted to 164,462/. Interest on investments yielded the sum of 44,539/., and the total credit balance, therefore, on the entire operations of the company for the year is 209,001/. This amount, after adding the balance of 451,772/., brought forward from the previous account, but deducting (a) 85,253/., being outlay consequent upon the purchase of the Equitable Fire and Accident Office, Limited; and (b) the

interim dividend of 17,831*l.* paid in November last, makes an available total of 557,689*l.* The directors propose:—(1) To open an accident fund, and to credit it with the sum of 20,000*l.* (2) To pay, on May 7, a dividend of 9*s.* per share (against 8*s.* per share last year) free of income tax, making, with the interim dividend already paid, a total distribution for the year of 57,951*l.*, or 13*s.* per share; and (3) to carry forward the remaining balance of 497,569*l.* to the next account. The financial position of the company will then stand as follows:—Capital paid up, 222,887*l.* 10*s.*; reserve fund, 750,000*l.*; accident fund, 20,000*l.*; balance carried forward, 497,569*l.* 6*s.* 9*d.*; funds, 1,490,456*l.* 16*s.* 9*d.*; capital subscribed, but uncalled, 2,005,987*l.* 10*s.*; total security, 3,496,444*l.* 6*s.* 9*d.* It is the present intention of the directors to increase the interim dividend for 1902, next November, by a further 1*s.* per share, making a total annual distribution of 14*s.* per share, free of income tax.

### AUCTION NOTES.

MR. ALFRED RICHARDS will sell on June 9, at the Mart, a building estate of nearly 600 acres in the neighbourhood of Winchmore Hill, and comprising "Grovelands"; the Winchmore Hill woods and Old Park; the Lodge estate, Palmer's Green; the "Hermitage" and "Cannon Hill," two charming residences in the Old Southgate village; the Home Farm estate of about 62 acres at Winchmore Hill and the Waterfall estate of about 24½ acres at New Southgate; also the old wayside hostel, the Fox, in the Green Lanes, Palmer's Green. The sale may well be alluded to as one of the most important sales of building estates that have taken place for many years past, as it is very seldom so large an area of land within such a short distance from town comes into the market.

MESSRS. BAXTER, PAYNE & LEPPER announce the sale on Tuesday next of the first portion of the Eden Park Estate, consisting of fifty-four plots of valuable freehold building land at Beckenham, Kent, situated in a picturesque, rural and healthy locality, near the Beckenham polo ground and golf links, and a few minutes' walk from Beckenham and Elmers End railway stations. The estate is suitable for the erection of detached or semi-detached residences and a few shops.

### BUILDING IN MEXICO.

IN a recent consular report, Consul-General Barlow, stationed at Mexico, says the great cost of building in Mexico is due not only to the high cost of building materials, but also to the exceedingly inefficient character of those who have to be employed in the work of construction. He states that it is about twice as much, on a gold basis, to build a house in the city of Mexico as it would be to do the same work in most of the cities of the United States. This, we say, is partly due to the higher cost of materials. Bricks cost from 14 to 16 dollars a thousand; and lumber of a somewhat inferior quality from 60 dollars per thousand feet. But one of the great obstacles to cheap construction is the inefficiency of the labour, which, while apparently cheap, is, according to our consul-general, fully three times as expensive as in the United States. American contractors engaged in the building business in Mexico state that from their personal experience they know that one American mason, whom they have to pay 8 dollars a day in Mexican silver, which would be equivalent to about 4 dollars per day in gold, will do as much work in bricklaying as twenty Mexicans, who can be hired at 1.25 dollars a day in Mexican silver. Mexican carpenters are paid from 1.25 dollars in silver per day, and one of them considers that he has done an extraordinary day's work if during that time he has been able to hang one door. There is one class of work in which the Mexicans excel, and that is stone-cutting, and apparently, a Mexican stonecutter who earns 1.25 dollars in silver in a day can do as much work and as good work as an American stonecutter who has to be paid about eight times that sum.

### NEW WORKHOUSE INFIRMARY FOR SOUTHAMPTON.

THE new infirmary building which has been erected in Shirley Warren for the Southampton Corporation was formally opened on the 15th inst, amid weather conditions which left much to be desired. The site occupied by the new building is on the high ground lying between Shirley and Bassett, its altitude being about 140 feet above sea-level at its highest part. Its area is about 36 acres, and it has the advantage of being always in a ring fence, having good public roads on three of its boundaries. The new infirmary buildings have been placed on its highest ground, and consist of the following group of

Entrance lodge, nurses' home, observation block, male cases, the administrative blocks, maternity female sick pavilions, three male sick pavilions, engineer and steward, and the laundry, boiler-house, tuary and workshop group. The sick pavilions are to the administrative blocks with covered ways. number of beds provided for is 300, about sixty to on, but should circumstances require it (such as the f the added areas within the Southampton Poor-law number can easily be added to by the erection of more pavilions, the administrative portions of the being built on a scale to admit to this. Each a two-storey building, and the whole five contain varying sizes, from twenty-four beds to three beds mit of the proper classification of the inmates as aracter, age and complaints. Each pavilion is pro- two staircases to minimise fire risk, and wide for convalescents' use, from which some of the best he neighbourhood can be obtained over the river New Forest, Lordswood and the town. All the re placed with their long sides facing approximately est, by which arrangement the wards will always full benefit of all sunshine. On the floor of each ices have been provided as follows:—Ward kitchen, range, larder, &c., bathroom, lavatory, with station wheels for patients unable to use bathroom, linen-oom for convalescents, slop-sink room and the usual commodation, the latter being in detached sanitary roached from main buildings by means of enclosed he pavilion halls are provided with lifts for food, coal, ey and the corridors are heated by hot-water coils, rds with central down-draught hot-air ventilating large open fires. Every ward is well ventilated, ards throughout finished with adamant plastering e colours being a soft green to the upper part with do and dark line to the lower part, all doors being hogany colour varnished, and all other woodwork ur, the general effect being bright and cheerful. s of rooms, ceilings and floors are rounded. The block has provision for eight beds on one floor, with ore wall space for each bed than in the other he finish, however, being similar to that described. istrative department contains accommodation for tee of management, the medical superintendent om only, as he does not live on the place), the

assistant medical officer, the matron, chaplain, porter and ser- vants generally, kitchen department, with larders, mess-rooms, &c., steward's department, with large general store (two storey), nurses' dining and cloak-rooms, matron's office, store and sewing-room, dispensary, anæsthetic operating-rooms, recep- tion wards and clothes stores for male and female patients, &c.

The nurses' home is a detached three-storey building and gives accommodation for about thirty nurses, probationers, &c.; it provides a small bedroom for each nurse, and contains, in addition, a general sitting-room, lecture-room, assistant matron's bed and sitting-room, small kitchen, bathrooms, &c. The home is not intended to provide dining accommodation, as all meals will be taken in the dining-rooms provided adjacent to the kitchen of main buildings.

The grounds have been tastefully laid out with roads, plantations, &c., levelled and planted in accordance with a scheme submitted to the Guardians by Mr. Rogers, of Red Lodge, and advantage has been taken of the large amount of surplus soil from the building excavations to level up the ground in front of the nurses' home to form a tennis court, and this, with a few of the smaller areas near the buildings has been turfed, the larger areas being trenched and sown for grass. The general contractor for the whole of the work, exclusive of electric lighting and the laying out of the grounds, but inclusive of the engineering and laundrywork, was Mr. H. Cawte, of Shirley. The architects were Messrs. Mitchell & Gutteridge, of Portland Street, from whose designs and under whose personal superintendence the whole has been executed. A brass tablet has been placed near the entrance of the administrative block recording the names of the Guardians and various officers, as well as the architects and contractor.

### NORFOLK COTTAGES.

THE sanitary committee of the St. Faith's District Council have been inquiring into the housing accommodation of Great Witchingham. The condition of the village can be judged by the following extracts from the report:—

In view of the complaint of the medical officer of health as to the scarcity and the insanitary condition of the cottage accommodation in Great Witchingham, the committee visited this parish on March 3, and made a general inspection. So serious was the state of things revealed by even a cursory examination that the committee felt that a full and detailed

## TAYLOR'S PATENT JUNCTION "

## GHAN'S PATENT GEYSER

6 HOLYWELL ROW, FINSBURY, LONDON, E.C.

NEW CATALOGUE FREE ON APPLICATION.

THE ARCHITECT. Handsomely Bound in Cloth, Price 12s. 6d. Office—Imperial Buildings, Ludgate Circus, E.C.

statement of the facts of the case was necessary, and they decided to extend their inquiry so as to cover all the cottages in the parish. In all, seventy cottages have been visited and examined. We have taken into account only such dwellings as are rented at 6s. and under.

Six cottages grouped together have a shallow surface well, sunk a few yards from the edge of a stagnant pool behind a mill from which it is fed. A pair of thatched cottages under one roof have outer walls cracked and dilapidated, and the building in bad condition generally; upstairs one room 6 feet high. Two new houses, each having two rooms downstairs and two bedrooms, eight occupants in one of the dwellings—man, wife, daughters of 27, 15 and 3, and sons of 17, 12 and 6. The other house four occupants—man, wife, girl of 17, boy of 15. Another group of five thatched cottages: bedroom accommodation very poor; in four of the dwellings the roofs slope down to the floor, making part of the floor space unavailable, and the windows very small and recessed into the thatch. Water from shallow well, not properly covered. In another dwelling the drainage goes into a dead well just outside living room, door broken, causing chronic overflow of filthy liquid refuse.

Yet another group of three houses form three sides of a tiny square in which storm water drains towards houses and floods up to the doorways, mixing with overflow from a defective dead well. Three other houses in this group were referred to in the report of the medical officer of health. As to the water supply, the committee found that there were two shallow surface wells, one for each set of three houses. The water on analysis showed that both wells are saturated with sewage, old and new. The water from one of these wells is used at the bake-house (for which purpose one of the group is used) in mixing the bread for the neighbourhood.

In one dwelling of a group of eight, each of which has two rooms up and two rooms down, there were seven occupants—four adults, a boy of fifteen and two girls, while there were also seven occupants in the old parish workhouse, which is yet parish property—with an attic as one of the two bedrooms. The only deep well in the parish serves a group of six outlying cottages, all of which have rooms on each floor.

Two cottages are described as built on a tongue of land between a narrow stream on one side and a ditch on the other, and as being practically on the water level. Here is the description of the premises:—"The bedrooms are 13 feet by 7 feet by 7 feet high and 9 feet by 12 feet by 7 feet, the stair

hole taking up much of the floor space in one. The so dilapidated that one can stand in the bedrooms and outside through the great jagged cracks. The privy is out over the stream, and has no receptacle, but a plank board which shoots out all excreta and refuse through a hole in the wall into the water. A few yards from this a plank has been let down to the stream, and a plank put across the stream to the occupiers to dip up water, this being their only supply. Besides the dilapidation of the outer walls, the roofs are so broken that they are patched over with mud to prevent the occupants of one seeing through into the of the other. Smoke passes freely."

Two other cottages afford this parallel picture:—In one the accommodation the worst visited. Bedroom merely a hole in roof. No staircase, but steep ladder over a door. Old sacks and quilts hung up and stuffed over the door to prevent decayed rubble from falling on bed. Two long by 7 feet wide floor-space, with roof sloping direct floor up to a peak; floor-space diminished by the stairs. Downstairs, sacks laid by door to keep weather out. The whole in a very rotten state, directly against the small boxed-off room used as pantry.

Another cottage is described as having a living room downstairs built against churchyard, and under ground 4 feet. Churchyard drains towards the cottage, and the water soaks through wall, which is in a rotten and stinking condition.

A pair of cottages owned by New College, Oxford, each one room up and one down, "Rubble walls cracked and bulged. Bedroom floor dragged out of gable by displacement of walls, and highly dangerous. Four and three occupants respectively."

In one of another pair of cottages, which have two rooms up and two down, there are nine occupants, a mixed lot of boys and girls. Steep ladder staircase, gables bulging and dangerous, floor parted from walls; privy accommodation bad and dilapidated. In the other cottage what is supposed to be a second bedroom is a dark end of the room, unventilated, without ventilation or light, except for a small glass let into the partition into the main room. Small room downstairs (brick floor) used as bedroom (11 feet by 6 feet 7 feet high). Floor so damp that fragments of mattress down are rotten and mildewed, and occupier complains that damp rots the mattress on the bed. No water supply, but water by permission from well that supplies the New College.

THE Latest and most Complete Lists of Builders open and the Lists of Tenders received are given week in the pages of this Journal. The Subscription, including postage, is by annum, or 10/- for six months; or you can order your newsagent for 4d. per week. Published EVERY FRIDAY by GILBERT & CO. LTD., at the Offices, 6-11 Imperial Buildings, Circus, London, E.C.

others have one bedroom each. There is a well across the lane for these cottages, but it has been for some time, and the only supply is from a well in the garden, into which a spring runs. The report concludes as follows:—

Most of the houses are clustered together in the main street. The houses here are so oddly stuck down at all angles so cramped and crowded in together, as to appear an urban slum than a rural village. Few of them have back ways, and refuse is dumped down into odd little patches of ground to such an extent, as analysis at Nos. 26-31 shows, that the soil is saturated to some depth. All the wells sunk in these odd patches of ground are shallow surface wells. A further general complaint against almost all the cottages is the brick pavement of the front rooms. These bricks are generally cracked and broken. With low ceilings and under-thatched roofs, it strikes one to enter these rooms, which are damp and dark, and when washed retain the wet for days.

Now, we point out that of the seventy cottages in the street, only two bedrooms, fourteen have only one, and six have three. Four of these six, however, have only one room downstairs for all purposes, and the alleged third room is generally a small and dark partitioned-off space in the main room. So that in reality there are not more than one or two rooms in the parish suitable for the accommodation of a family of boys and girls, for which a minimum of two rooms is essential for health and decency. There are many cases of overcrowding, and several others in which the overcrowding limit may not be passed, the want of sleeping accommodation for big boys and girls is And in addition to these there are eighteen cases of existing houses ought to be absolutely condemned for human habitation for structural and sanitary reasons. These are the cases numbered 1, 2, 26, 27, 28, 29, 30, 35, 59, 60, 64, 65, 66, 67 and 68 in our detailed report. These are only the very worst cases, in which action is imperative.

The difficulty of dealing with them is that there is no accommodation at present available for the displaced people. The Council put its full powers into force in all these cases and simply turn a large number of people houseless upon the street. The law now throws upon the District Council, in such conditions, the duty of providing accommodation as this. The need for accommodation is obvious

and urgent; and in view of all the circumstances of the case we recommend:—

“That the District Council do apply to the Norfolk County Council for permission to adopt Part 3 of the Housing of the Working Classes Act.”

### THE STORY OF A COTSWOLD CHURCH.

FOR many years past, writes a correspondent of the *Birmingham Daily Post*, the ruinous condition of the fabric of Guiting Church has been a matter of notoriety in the Cotswolds, and now that another effort is being made to raise a fund for its restoration the grievances which wrecked former endeavours in that direction are being again stirred up. As far back as 1890 the diocesan architect (Mr Walker) was engaged to make an inspection and report on the church, and he prepared plans and estimates showing that a sum of 1,000*l.* at least was required to be expended upon the edifice so as to insure comfort and decency for the worshippers, some 700*l.* of this being necessary to put the main building in order, and the other 300*l.* for repairs to the chancel. From that time to this practically nothing has been done either to the church or to the chancel, and only the other day the local inspector of nuisances had occasion to make complaint to the Winchcombe Rural District Council of the condition of the building.

The present appearance of the chancel, both internally and externally, is little short of disgraceful. Externally, there is a big hole in the roof through which the rain pours, and this portion of the building requires complete overhauling. Internally, the condition of the chancel is left to the imagination, a boarded screen hiding it from view, though a closer inspection would reveal amid general ruin the scaffolding which once gave hope of a speedy restoration. The chancel is the most dilapidated part of the edifice, but the same causes, time and weather, which have operated to bring about its decay, have also had their effect upon the nave and other portions of the building, and if twelve years ago the architect found it necessary to prescribe repairs involving a total outlay of 1,000*l.*, it may be reasonably inferred that an even larger sum might now be required.

As to the circumstances leading to the present deadlock, the responsibility for the repair of the chancel rests, it is stated, with two lay rectors, and, rightly or wrongly, the failure of the rectors to carry out this obligation is said to be the reason why the necessary funds for the restoration of the body of the church

are not forthcoming. When the architect prepared his plans and estimate in 1890, showing that about 300*l.* would be required to put the chancel alone in order, the restoration committee approached the lay rectors with this proposition, that instead of paying the whole of the sum which might properly be asked of them, they should pay 100*l.* each and forego the right of sitting in the chancel and of entering by the priest's door, and that they should also agree to the chancel being repaired at the same time as the main portion of the church. Both rectors appear to have at first agreed to these conditions, and one of them, Mr. Walker, paid over his 100*l.*; but the other, Mr. Ashwin, subsequently wrote intimating that, after consulting with Mr. Walker, they had "thought it best to undertake the repairs to the chancel themselves," while they also made it plain that they had no intention of giving up the privilege of sitting in the chancel after it had been restored. The difficulty resulting from this changed attitude has never yet been overcome. The Bishop of the diocese was asked to intervene to compel the lay rectors to do their duty by the chancel, but without effect. The Bishop's secretary (Mr. Bonnor) wrote:—"I have done all I could in the matter short of taking legal proceedings against the lay rectors, and without the Bishop's express orders I cannot plunge his lordship into litigation, the result of which may be that he will, if unsuccessful, have to pay the costs." What makes the matter all the more deplorable is that there was, according to the treasurer (Mr. John Waddingham, whose father had offered 500*l.* to the restoration fund), sufficient money available for the complete restoration of the church, yet apparently through this difficulty with regard to the lay rectors' seats in the chancel, nothing beyond the sticking up of scaffold-poles inside and outside the church has been done in the course of twelve years. When the late squire of Guiting died, Mr. John Waddingham, his son, wrote to the Bishop offering to subscribe 500*l.*, as his father had offered before his death, on condition that the lay rectors were compelled to carry out their obligations; but the Bishop again declined to resort to legal proceedings, and, the chancel having been then boarded off from the nave, Mr. Waddingham, at his own cost, put the other portion of the church in such a condition that Divine service in the building was possible, and so things have remained till now. The present curate-in-charge (Rev. G. B. Sharpe) naturally wishes to see the original scheme of Mr. Walker carried into effect, and has issued an appeal for funds, in which he says:—"The state of the chancel is in no way attributable to the present patrons. It came to them thus upon

the decease of the late patrons. But, as farmers suffer depression in agriculture, and in other ways, they are to do their utmost, as also the people of the village. Waddingham has published a statement showing the events according to his view twelve years ago, and intending subscribers before giving their money to pay to the church and see it for themselves.

### A CONTRACTOR'S WILL.

SIR THOMAS LUCAS, first Baronet, of 12A Kensington Gardens and Heatherwood, Ascot, for many years a partner in the firms of Lucas Brothers and Lucas & Aird, died on March 6 in his eightieth year, leaving personal property valued at 594,306*l.* 10*s.* 10*d.*, and the whole of the residue of his estate, valued at 775,984*l.* 5*s.* 9*d.*, and his will, dated June 27, 1901, codicil of February 20, 1902, has been proved by Dame Amelia Lucas, the widow; Sir Arthur Charles Lucas, first Baronet, of 30 Wilton Crescent, and Reginald Jaffray, of Queen Anne's Mansions, Westminster, the sons; Sir Rahere Paget, Bart., of 4 Paper Buildings, Temple; William Trotter, of King's Beeches, Sunningdale, five executors.

He bequeathed to the Albany Memorial Chapel at Ascot 500*l.* for the endowment fund, or for building a parsonage house, or for such other purposes as His Majesty may select; to the Lowestoft Hospital 250*l.*, to the Lowestoft Convalescent Home 250*l.*, and to his wife 3,000*l.* for family pictures, plate, linen, china and jewels, and for life or widowhood of Heatherwood, with the furniture, &c., therein, and other household effects at Kensington Palace Gardens, of the value of 1,500*l.*, the income from 175,000*l.*, or an annuity of 2,000*l.* in event of her again marrying, these benefits for Lady Lucas be in addition to the provisions made for her by her previous settlement. Sir Thomas further bequeathed 150,000*l.* for his son, Sir A. Charles; 25,000*l.* in trust for his daughter, Kate Golder Maudslay; 10,000*l.* in trust for each of his daughters, Constance Mary Penn, Amy Florence Mary Alice Fryer; the advowson of the rectory of Ascot and a life policy for 10,000*l.* to his son, the Rev. Francis Lewis Lucas; 200*l.* each to Sir John R. Paget and William Trotter; 500*l.* each to Amy Dorothy Penn and Constance Penn; 500*l.* to Mrs. Mary Saffery; 250*l.* to Gerald

2,000l. in trust for Constance Julia Barclay; 1,000l. to John Middleton, and other legacies. to the interest of Lady Lucas in the sum of 50,000l., part thereof, in trust for his son, Charles, and the remainder to his sons, Reginald Edward Lingard, Ernest Murray, Francis Granville Evelyn Penn. All other his estate and effects he left for his sons, Reginald Jaffray, Edward Lingard, Ernest Murray, Francis Granville Lewis and Evelyn Penn, but sums already given or advanced to all his sons are left into hotchpot.

### ELECTRIC TRACTION.

A lecture was delivered last week before the members of the Institution of Mechanical Engineers upon the above subject by Mr. Philip Dawson, M.I.E.E. The lecturer showed, says the *Manchester Chronicle*, how much slower the United Kingdom had been in the adoption of electric traction than the Continent; but great strides had been made in the last ten years, and were now being made. The most successful tramway was probably that which had been installed at Bristol, which commenced running in 1896, but there were now over eighty lines in the country while some twenty-five more were under construction and would shortly be open. There were 1,252 miles of electric traction in operation, 846 in course of construction, and 4,500 motor cars either in operation in the country. The total invested in electric traction at the end of the year was 51,000,000l., and the capital invested in power distribution was about 20,000,000l. The Metropolitan Electric Railway itself put in nearly a quarter of a million horse-power at its power-station plant, equipped a thousand miles of track and put nearly 3,000 cars into operation. The Chiswick Electric Railway, now under construction to work the Metropolitan and other allied lines, would operate nearly 200 electric cars, probably an average of 150 tons each, over a track of 15 miles of double track, averaging from fifteen to twenty miles an hour. The capital already involved for this scheme was about 16,000,000l. and that amount would be very largely increased. Dealing with the methods of applying electricity to traction, he said they were three, viz. the overhead, the conduit and the third rail. The third it was not necessary to deal with.

Only one scheme beyond an experimental stage had been carried out under it in Paris, and that was now being taken up, while the conduit system, which under the best conditions was many times the cost overhead, could for that reason only be used in very populous areas, and was not suitable for general use. Among the points dwelt upon was the need of excellence of workmanship and stability in the permanent way of equipment, but he said that every part of electric tramway work had now been so carefully considered that there was in the present day absolutely nothing experimental about the whole subject. A very large amount of experience had been gained, and everything had been standardised, so that there need be no hesitation as to the results which would be obtained through the installation of the ordinary direct current system. In concluding his lecture, the speaker said that until it could be satisfactorily proved that electric traction would reduce the work and expense, it was certain that none of the large railway companies would adopt it for long-distance travelling. He did not think himself that any of the high-speed railways at present proposed could be made financially successful for long-distance travel. It was expense rather than time which would be the determining factor. They were by no means near the limit of speed of steam locomotives in this country, and he contrasted the speeds attained here with those, for instance, on the Pennsylvania Railway and on the Northern Railway of France. Long-distance electric traction was no doubt a fascinating subject, but should not be at the present moment considered practical. They were entirely unprepared at the present moment to undertake the electrification of main lines. It had not been shown it would pay if it were done, and they really did not know how to do it. On urban and suburban lines the case was entirely different. There the traffic was ready made, awaiting greater facilities which electricity alone could furnish. Here, as with tramways, there was knowledge and experience to point the way in which the work should be carried out.

The Mayor, in speaking of the pleasure with which he had listened to Mr. Dawson's lecture, said they regretted the present attitude of Cheltenham in regard to the Gloucester scheme for laying down a system of electric light railway. They seemed to be somewhat in opposition to Gloucester, although he might say they regarded that opposition on the part of Cheltenham perhaps more in sorrow than in anger. Notwithstanding opposition, he hoped to be able to carry out their scheme in due time, and add their little quota to the fifty millions of capital invested in these great undertakings.

**MASONRY FOR RAILWAY BRIDGES.**

THE following suggestions for specifications of masonry have been prepared by a committee of experts for the American Engineering and Maintenance of Way Association:—

All stones used for masonry shall be sound, durable, well seasoned from sources approved by the engineer, and shall be laid on their natural beds.

Mortar for laying up stone masonry, unless otherwise expressly stated, shall consist as follows:—Either one part by volume measured loose of approved Portland cement to three parts of good, sharp sand, or one part of approved natural cement to two parts good, sharp sand, all to be very carefully measured and mixed, and to be used within one hour after mixing, and always before it shall have commenced to set.

Mortar for pointing shall consist of one part Portland cement to one or two parts of sand.

*Finished Cobings, Parapets, Bridge-seats and other finely dressed special Stones.*—Work that comes under this head shall be of selected stone of the best quality, free from defects, shall be very accurately cut, being finely bush-hammered where called for, and as per plan and dimensions given. To be laid to  $\frac{3}{8}$ -inch joints.

*First-class Masonry.*—First-class masonry will be laid in Portland cement mortar, in regular courses, each stone being carefully cleaned and dampened, if desirable, before setting. The face stones shall be rock-faced, with edges pitched to a straight line, and no projections exceeding 3 inches. A draft line, 2 inches wide, shall be cut at each angle in the masonry. The beds throughout and the joints for 12 inches back from the face shall be dressed to lay to  $\frac{1}{2}$ -inch joints. No course shall be less than 12 nor more than 30 inches in thickness except the coping, and the thickness of any course shall not exceed the course below it. Stretchers shall not be less than 3 feet long, and not less than 18 inches wide, nor less in average width than  $1\frac{1}{4}$  times their height, and at no single place less in width than height.

Headers must not be less than 4 feet long, where the wall is of sufficient thickness, and the majority shall exceed that length. Where the wall is not over 5 feet thick, they shall extend entirely through the wall. Headers will extend at least 20 inches beyond the width of the adjacent stretchers. The usual arrangement shall consist of headers and stretchers, alternately arranged, so as to thoroughly bond together the face stones and the backing; for rare exceptions, two stretchers will be allowed to one header, by special permission, to cover

each such case. The stones of each course of the face shall break joints at least one foot with those of the course below. No hammering will be allowed on any stone after it is set. Each stone must be set upon a full bed of fresh mortar, laid broadest bed down, and brought to a firm and level surface without spalls or pinners.

*Backing.*—The backing shall consist of large-sized stones laid in full mortar beds, and breaking joints as to thoroughly bond the work together. The spaces between the larger stones shall not be over 6 inches in width, and shall be thoroughly filled with small stones and spalls laid in full mortar. All spaces flushed full with mortar or good cement grout. Courses shall correspond with the face stone, but may be laid up in part by two thicknesses, providing no stone less than 8 inches thick be used. In cases approved by the engineer, satisfactory Portland cement concrete with large aggregate embedded in the concrete may be used for backing.

*Second-Class Masonry.*—Second-class masonry shall be laid in cement mortar. The face stones shall be rock-faced, no projections over 3 inches, edges pitched to a straight line, shall have parallel beds and rectangular joints. The beds shall be dressed to lay to  $\frac{1}{2}$ -inch joints for 8 inches back from face shall be dressed to lay to  $\frac{3}{8}$ -inch joint. The stones need not be laid up in regular courses, but shall be laid level on their natural beds, well bonded, having at least one header 3 feet 6 inches long, every three stretchers with joints well broken; no stone shall be less than 8 inches thick, and no stone shall measure less than 12 inches in least horizontal dimensions less than 12 inches, nor less than its thickness.

*Backing.*—The backing shall consist of well-shaped stones, not less than 6 inches thick, and of which at least one-third shall measure 3 cubic feet, to be laid in full mortar bed, joints well broken, well bonded together and with the face stone. All spaces to be thoroughly filled with small stones and cement mortar.

*Third-class Masonry.*—Third-class masonry shall be laid in dry or in mortar according to the direction of the engineer. It shall consist of good quarry stone laid upon the natural beds, and roughly squared on joints, beds and faces, the breaking joints at least 6 inches; the walls shall be bonded together by headers, occupying one-fifth of the area of the wall front and rear, and extending through walls, or less in thickness; no stone shall be used in the face of the wall less than 6 inches thick or less than 12 inches on the least horizontal dimensions.

## THE WEEK.

ct of the catastrophe in Ibrox Park is that the es of Glasgow have become anxious about the of similar stands where crowds gather. The Master accordingly arranged for an examination of several s. The reports are not reassuring. It was found er was decayed, that supports were out of repair, and stand was too weak, that terracing needed and reconstruction—indeed, it would appear that the existing structures would sustain the fatal test o Ibrox Park. In England it may not always be to make a similar examination of stands in fields orts take place, but, wherever it can be done, us parts should be carefully scrutinised. The be erected in London to enable people to view nation ceremony will, we hope, have stability, but wise to thrust the responsibility on the borough They are not long enough in existence to have a staff of scientific officials for such a purpose. ict surveyors claim that the control remains with heretofore, and has not been altered in any y the recent decision of the Law Courts. A case prepared, and will be submitted to the High soon as possible, so that this important question sible authority in these matters may be decided elay. For the sake of the public we hope the veyors will be successful.

NE has now its "Musée Bonnat," which has ted and furnished with works of art by the great who is a native of the city. The building is in Bassano and was designed by M. PLANKAERT. er is also a collector, and some of his pictures n seen in the winter exhibitions of the Royal Among the works presented to Bayonne are by REYNOLDS, HOPNER and LAWRENCE. The ortant of the Italian works is a Virgin and Child o LIPPI. There is also a figure of CHRIST by LA FRANCESCA. Designs by the principal masters and Germany form part of the collection. There atuettes, Etruscan vases, ivories, &c. French art ed under several aspects. There are numerous y INGRES, and others by his rival DELACROIX. onzes by BARYE, FREMIET and DAVID d'ANGERS e collection. M. BONNAT has contributed some and etchings by himself. The Musée will always emorial of an artist who in portraiture has not ased in modern times, and whose figure-pieces s remarkable.

ave already expressed an opinion about the of the Amesbury Parish Council to have all removed from the different tracks over Salisbury h the public were accustomed to use when visit- enge. It would be well if the ancient stones and around were national property, but by law ivate possessions, and therefore must be respected oclosed demesne. The Amesbury Council invoked f the Wilts County Council. The Marquis of Hon. PERCY WYNDHAM and Mr. FULLER, M.P., onsequence deputed to make inquiries. Their e now completed. Mr. WYNDHAM states that in ent the public who visit Stonehenge do so as in the same way as many places of interest or visited on land in private ownership, without its intended or supposed that a public right has lished by their so doing. He is therefore against y council's taking action, but expresses no opinion her or not it is advisable that Stonehenge, under condition of its surroundings, should be enclosed. es the hope already expressed by the county at Stonehenge should become the property of the ord BATH says that he is of opinion that the hich their attention was called were in the nature ass, to which perhaps no importance had been owing to the slight traffic and inconvenience

caused. He is strongly of opinion that, even if it be decided that the tracks are rights of way and that the enclosure blocks them, it would be extremely undesirable for the county council to take over the powers and duties of the Amesbury Rural District Council. Mr. FULLER states that in his opinion immemorial and unchallenged usage has established a public right upon all the tracks in question, and that presumption of dedication may be held to exist, and that the present fence, in so far as the tracks in question are concerned, is an illegal obstruction and ought to be removed. He does not think, however, that the county council would be justified, without a further and fuller inquiry, in taking any action in the matter. The roads and bridges committee, to whom the reports were given, will consider the subject before making any recommendation to the county council.

THE art of the wood-engraver has not so generally succumbed to reproduction by photography in Paris as in London. There are still masters who are encouraged by amateurs, but their plates are *objets de luxe*. The interest which continues to be taken in xylography has made it necessary to hold an exhibition of the art in the Ecole des Beaux-Arts, which is to be opened to-morrow. It will be more comprehensive than any others relating to wood-engraving which have been organised. We hope English work will be adequately represented. There was a time when Frenchmen were not afraid to acknowledge their envy of the success of the English engravers on wood, but although they could not imitate the peculiar neatness of the English blocks they were able to show more force, owing mainly to the co-operation of draughtsmen who were painters. Wood-engraving was at its best when used for the illustration of books, and the French publishers favoured the art because it was an obstacle to the counterfeiting of books in Belgium. As there was no means of reproducing cuts except by copying them, the printers in Brussels had not the courage to undertake the expense, and French works of a costly kind were not driven out of the market by pirated editions.

ONE of the streets in Paris which branch from the Rue St.-Antoine is the Rue Beautreilles. It joins at one end the Rue des Lions, which leads into the Rue St.-Paul. They are all near the Lycée Charlemagne. There is now no church dedicated to St. PAUL in Paris, but the Jesuit church in the Rue St.-Antoine is known as St.-Louis St.-Paul. The old church was named St.-Paul des Champes, because at that time it was in the country outside Paris. Then it served for the Hôtel de St.-Paul and the Palais des Tournelles. Attached to it was a cemetery, and among those who were buried in it or beneath the floor of the church were RABELAIS, FRANÇOIS and JULES MANSARD, as well as several of the prisoners in the Bastille. It is recorded that on November 20, 1703, the "Man in the Iron Mask" was interred there under the name of MACHIALLI. The church was demolished in 1800. The neighbouring Rue Beautreilles was so called from the trelliswork of the hotel, which is stated to have been the old Hôtel St.-Paul. That palace was erected by CHARLES V. in 1364, and resembled a large farm with residences for the king, the princes, the dignitaries of the State and the principal officers of the Court. From the buildings there were underground passages leading in various directions. No. 17 in the Rue Beautreilles is now in course of demolition, and a more remarkable building is not easily discovered. Human remains appear to be met with whenever the ground is turned up. The operations have revived an interest in the legend of the "Man with the Iron Mask." It is suggested by people that the coffin or some other indication would be met with if a systematic examination of the place were made. It is not to be expected that the mysterious prisoner carried with him to the grave any clue to his identification, but if from the remains it could be ascertained whether MACHIALLI or MATHIOLI was a man of about forty in 1703, then he could not be the twin brother of LOUIS XIV., and one of the interpretations of the mystery would be set aside as baseless. The inquiry would have a more personal interest than any other undertaken of late years.

## ARCHITECTURE AT THE ROYAL ACADEMY.

THE painters and sculptors were supposed to be reserving their forces for Coronation year. It is possible that in consequence some people may anticipate wonderful pictures and statues, and will be disappointed when they see the present exhibition at the Royal Academy. The work of architects is produced under different conditions, and is rarely speculative. The few amateurs who will visit the architectural room during the season must not on that account be too exigent. They should remember that the character of a year's architecture depends on the commissions which have been received. During the last year they have not been remarkable. The exhibition in consequence does not contain examples which demanded exceptional skill in design.

In considering the contents of the architectural room, it is always well to begin with the drawings which have been submitted by Academicians and Associates. Mr. NORMAN SHAW and Mr. WATERHOUSE are not among the exhibitors. Mr. AITCHISON is represented by a drawing of City offices in a Neo-Grec style, but it is so simple there would be no chance of its admission if it bore the name of an outsider. Mr. JACKSON contributes a design for an organ-loft and screen, with two stall ends which flank the entrance and have a novel effect in the room. Mr. BOPLEY has a drawing of a new church at Kensington which is only interesting for its windows, and a small drawing of the monument to the late Duke of WESTMINSTER. Mr. BELCHER enjoys the advantage of having his five drawings hung together—an arrangement which it would be well to adopt with other exhibitors. They consist of a country house, business premises, a board-room and two gardens. Mr. ASTON WEBB (with Mr. INGRESS BELL) shows the general scheme of the new buildings for the University of Birmingham, but the drawing must be regarded as serving only as a diagram or slight indication of what is contemplated.

There are 233 drawings and models exhibited. It will be quickly perceived that they can be formed into a very few classes. About one-half of them are dwelling-houses; there are several churches, some business premises and schools. Designs which may be looked on as relating to public works never occupied so little of the walls. Municipal buildings are also rare. In fact, if the churches and the houses were excluded there would not be many designs left to suggest the tendency of architecture at the present time. Whether the rejected drawings were as restricted in their nature cannot be determined, but it might easily be assumed that the exhibition acquired its peculiar unambitious character in order to correspond with some prearranged scheme. Indeed, in some cases it would not be difficult to imagine that representatives of a ratepayers' association were allowed to have a voice in the selection. There are school buildings, for instance, to be seen which can be carried out on most economical terms, for they are wanting in the qualities which are usually held to belong to architecture.

From the general correspondence between so many of the drawings the characteristics of the buildings are not easily described, for the terms which serve in one case are applicable to many others. Country houses, for example, have now assumed so generic a form that without the aid of drawings and plans it is almost impossible to discriminate between them or to explain to what extent ingenuity is apparent. It would seem as if almost every exhibitor accepted definite limitations, and put a check upon invention in order to insure acceptance.

The "Shoreditch Town Hall," by Mr. W. G. HUNT, is of that type of Italian which finds favour with public bodies, the chief consideration being a tall tower. Mr. GUY DAWBER has two views of "Westhope Manor, Shropshire," a large country house partly half-timbered and having several gables. The "Golf Club House, Halifax," by Messrs. WALSH & NICHOLAS, is somewhat indefinitely drawn, and there is nothing unusual in its appearance. The "New Police Station in Hyde Park," by Mr. J. D. BUTLER, is an official drawing of a long plain building with a verandah. Mr. A. N. PRENTICE shows a house in Bedford which is unpretentious, but unlike some others is not suggestive of being readily blown away. Messrs. ERNEST GEORGE & YEATES contribute two drawings of

new works at Welbeck Abbey. "The Duchess's Bedchamber," by Mr. J. D. BUTLER, shows a coffered ceiling elaborately decorated. The chimney piece is a fine design, and the door seems to be carved in the wall. The appearance of the room is charming. The dining-room has an arched roof; at the end is a buffet with a gallery. If the style can be considered as Elizabethan, the treatment is especially the ornamentation, has more of the freedom and delicacy than was usually introduced into England during the sixteenth century. By the same architect is "Foxcome, Oxford," the additions consisting of a low tower, an immense hall with large windows, a morning-room. "The Public Library, Holbeck," by Mr. BAKEWELL, is effective from the contrast between the red brick and terra-cotta dressings, and the arched square windows. "The New Gaiety Theatre and Restaurant," by Messrs. ERNEST RÜNTZ & Co., has the advantage of a corner site; the end is rounded, and the building assumes a definite architectural character which is free from the irrelevancies which of late are thought essential for a theatre. Gloom would appear to be the quality which was sought after by several architects last year. The new Banking Premises, Sunderland, by Mr. W. H. BRIERLEY, has the lower storey in stone, almost black, while above is a light yellowish sandstone. The contrast possibly is less violent in the building. Among the houses which will be found here is one at Oxfordshire, by Mr. C. M. PEARCE; a block of four in Hampstead of a gaunt character, by Mr. H. FIELD; a house in Wimbledon, with a very large ornamental form over the window on the first floor, by Mr. W. T. WALKER; a timbered house at Ardingly by Messrs. WHISTLER & CASTLE; and one at Wrotham, Kent, with windows which seem almost continuous across the front, by Messrs. NIVEN & WIGGLESWORTH. "The Cottage Home for Poor Law Children," by Mr. C. M. SHINER, has the appearance of the workhouse about them. A restaurant at York, decorated in dull green and white, is by Mr. A. J. BAKER. The "Font and Decoration," by Mr. G. J. LACY, shows marble columns beneath the font. The roof and walls are painted, and the whole composition suggests a satisfactory baptistery. Mr. E. M. HICKS's "Design for a Sunday School Church" recalls the work of the late J. D. SEDGEMAN. There is much tracery, which in parts becomes almost boyant in character. Mr. JACKSON's design for an organ-loft and screen at St. Mary's, Oxford, has arches below rather long cusps; figures and ornament are introduced into the spandrels and the organ-case is elaborately carved.

Messrs. BRIGGS & WOLSTENHOLME's "Offices for John Dempster & Co., Liverpool," is a stately building which befits merchant princes. The style is Italian, and there are broad distinctions which suggest different uses in the upper and lower parts. The monumental slab over the entrance to the minster Abbey, which is a memorial of the late Mr. J. PEARSON, R.A., is by Mr. W. D. CAROE; it is inlaid with brass cross with borders of fine ornament. In Mr. J. D. WOOD's "Offices, Oldham," colour is employed to suggest "The City Offices," by Mr. G. AITCHISON, cannot be accepted as worthy of a professor of architecture; the treatment especially is very feeble, indeed almost chaotic. "The Royal Villa, Le Coq-sur-Mer, Ostend," by Mr. A. MITCHELL; it is of English country-house type, and is free from the extravagances which are found in villas in the district. The openings in the wall were, no doubt, dictated by local circumstances. W. M. BRUTTON's "32 and 33 High Street, Marylebone," is a pleasing effort to deal with a narrow frontage. The shops below do not give the impression that the building supported on panes of glass, and the entrance at the first floor deserve to be noticed as elegant in treatment. In this drawing are houses by Mr. CECIL BROOKS, Mr. A. CORBETT, Messrs. FARQUHARSON & EVIL, Mr. P. R. & Co. Mr. L. STOKES's Ascot Priory is modernised but there is a clock-tower, day-room, cells, and a large corner with figures above it. "The Shannon Factory, District," by Mr. E. O. SACHS, is rather foreign in treatment, but there is an honest endeavour to overcome the monotony of similar buildings in England without much increase in expense or interference with requirements. E. B. WETENHALL shows three fantastic porches for country houses. The additions to Alexis Street, Southwark, by Mr. T. J. BAILEY, becomes from

the bricks more sombre than is usual with London schools, which is saying much. Messrs. FREEMAN & CO. have employed timber instead of stone in the roof of a new church in Essex. "Christ Church," by Professor BERESFORD PITE, is interesting from the way in which it is expressed in it, the lines of the semi-circular windows leading on to a central dome. In the "St. Clapham Church," by the same architect, three bays are divided exteriorly by pilasters, and panels are introduced over the windows. "The British Hospitaller Church, Constantinople," by Mr. H. PERCY ADAMS, is inspired by local spirit, for if compared with an English building of the same class the parts would appear to have been composed by chance. Everything, however, seems bright. There is a large house at Leamington by Mr. H. O. CRESSWELL, arranged on a convenient plan. The "South Drawing Room, Mantle-piece in a House near Piccadilly," by Mr. J. COOPER, is remarkable from the size of the two windows, which perhaps were meant to symbolise seal; it is rare that sculpture is shown so well in a drawing or etching. "A Suggested Treatment of the Mall," by Mr. F. INIGO THOMAS, might have been prepared for the general competition for the Queen VICTORIA Memorial, if one were allowed. The arrangement of the drawing of the roads looks more formal on the drawing than would be if realised. There is an architectural screen in front of the Palace, from which rises in the centre a statue of the QUEEN. Such a memorial would be far less expensive than any of those which were entered in the competition. The chancel screen for St. Peter's, Potter's Bar, by Mr. R. W. PAUL, is so light, it could not be objected to as an obstruction; in the frieze roses and other emblems are introduced; a rood is introduced at the top of it. Mr. J. C. HIDE's "Design for a Public Building," obtained the Academy gold medal in 1899; a drawing is included in the group, and the drawing is vigorous. There are two admirable church interiors by Mr. FELLOWES. In both, red brick and light stone are employed. In St. John's, Sidcup, the roof is coloured a soft green; there is a screen, and the angles near it have several small storeys. In Christ Church, Sydenham, the screen is carried to the roof, the lower part having only two thin piers, above there is rich tracery. The two form a strong contrast if compared with the "Interior of a Small Priory," by Mr. C. H. M. MILEHAM. It is Romanesque; there are several altars and galleries with curtains, and the altars are presumably are connected with a convent.

(To be continued.)

## THE CORONATION STONE.

It is often difficult to account for the reverence which is paid to single unhewn stones in remote ages. We can well imagine how simple people would consider stones which fell from the clouds as having mysterious powers, and they would preserve them and carry them about with them as if they were celestial communications, of various interpretations might be offered. But many of these stones which were respected could not be classed as such, and we must therefore endeavour to explain the reverence attached to them on a different basis. The stone in the Coronation Abbey, which is placed under the seat of the Coronation chair, is one of the puzzles, and it will be considered inopportune if we now refer to its history.

It is stated that the stone was deposited in Westminster Abbey. The entry in the Leland Collection relating to it runs as follows:—"Edwardus cathedram regalem Scotie in Westmonasterium transtulit ut illic esset sedes missarum celebrandarum." The stone, it will be observed, is not actually deposited, but only a chair or seat which was to be used after celebrating mass at the shrine of the Virgin Mary. But in the same year there is reference to the inventory of the Crown jewels which were kept in the Tower of London. It is described as a large stone upon which the kings of Scotland were crowned, "una petra super quam Reges Scotie solebant coronari." The regalia had been acquired by EDWARD I. when the

luckless BALIOL was stripped of his royal robes in a most ignominious manner. Sir WALTER SCOTT says:—"It cannot be doubted that the English king retained possession of these royal insignia, since he was at the pains to transport to London the celebrated marble stone used at the Coronation of the Scottish kings—an emblem of his victorious usurpation neither so valuable nor so portable." HUME in his "History" says there was an ancient tradition among the Scots that wherever the stone was placed their nation should always govern, and on that account it was carefully preserved at Scone as "the true palladium of their monarchy, and their ultimate resource amidst all misfortunes." At the present time it is not easy to understand the state of mind which could connect the safety of a whole kingdom with a piece of sandstone; but it must be granted that the Scots were not unique in the superstition. The part performed by the stone in primitive Coronation ceremonies cannot better be described than in the words of Sir WALTER SCOTT:—

It happens that the Scottish writers, seldom very full in recording matters of mere ceremonial, have left us no particular account respecting the rites of coronation. One remarkable part of the ceremonial, as practised in the early monarchy, seems to have derived its origin from the ancient Celtic ceremony of placing the new chief, or thane, upon a stone or rock when assuming for the first time the command of his tribe. Indeed, the stone itself, termed in the Gaelic Lia Fail (the fated grey-stone), is said to have been originally brought from Ireland by Fergus, and (according to the Book of Howth) was vocal in heathen times like the pulpit of Mahomet or statue of Memnon, and emitted a sound when the lawful heir of the crown first was placed upon it. The priests, with the art which they so frequently practised, seem to have adopted, and, after their own manner, sanctified this custom; and hence the usage of placing the new-made monarch of Scotland upon the fated stone, which now altered its character without losing its sanctity, and was credulously believed to have been the pillow of the Patriarch Jacob when he beheld his vision in the field of Bethel. This part of the ceremonial, the only one very peculiar to Scotland, was abolished by the transference of the fatal stone to Westminster, it being of course impossible to find any substitute for so venerable a relic. This loss was sustained several years before any part of the present regalia had an existence, and the sight of the Scottish palladium in the Abbey of Westminster is still an affliction to the eyes of the more zealous Scotsman.

The first question that arises is, Whence did the stone come to Scone? JOHN of Fordun, in his Chronicle, relates:—"There came over from Ireland a certain king, bringing with him into Scotia the regal chair carved out of marble, and in it he was there crowned their first king by the Scots. All subsequent kings who succeeded to the throne followed his example, and duly assumed the crown in that same chair. This was the chair which SIMON BREC first brought to Ireland." KENNETH McALPIN is by some authorities believed to have installed the stone in the church at Scone about A.D. 850. This tradition was adopted by HOLLINGSHEAD. In his "History of Scotland" he records how "King KENNETH having thus destroyed the Pictish kingdom together with almost the whole nation, caused the marvellous stone (which SYMON BRAKE sometime brought out of Spain into Ireland, and the first FERDUS out of Ireland into Albion, as before related) to be brought now forth of Argile where till that time it had been diligently kept into Gourie, which region before appertained to the Picts, there to remain from thenceforth as a sacred token for the establishment of the Scottish kingdom in that countrie: he placed it at Scone upon a raised plot of ground there because the last battle he had with the Picts was fought near unto that place." It would appear to be probable that the stone was placed within the abbey for safety, but on occasions when it was required it was brought outside to a mound or mote-hill. There is little doubt that in Scotland and Ireland the open air was preferred to the enclosure of a building whenever great events had to be transacted.

It is not related how the stone was acquired in Ireland. An interesting paper on "The Coronation Stone at Westminster and the Lia Fail at Tara" was read before the Royal Society of Antiquaries of Ireland on March 25, 1902, by Mr. P. J. O'REILLY. But in it there is nothing to show whether the stone is to be considered as a trophy which

was won in an invasion, or whether it belonged to one of the Irish clans that emigrated to Scotland and brought the stone with them. In Ireland, where there were a great many small kingdoms and principalities, each was likely to have its special Coronation stone. That is suggested from the account by SPENSER, the poet, of the institution of a chief:—"They use to place him that shall be their captain upon a stone always reserved for that purpose, and placed commonly upon a hill, in some of which I have seen formed and engraven a foot, which they say was the measure of their first captain's foot, wherein hee standing, receives an oath to preserve all the auncient former customes of the countrie." There is a fine ballad by THOMAS DAVIN entitled "A True Irish King," in which he chants the accepting of office in ELIZABETH'S reign by one of the O'NEILLS. Mr. O'REILLY tells us that the chair used on that occasion survived until a comparatively recent period. "The chieftain of Tir Eoghain was inaugurated by his hereditary brehon, the O'HAGAN, placing a gold sandal on his foot, while he was seated in an inauguration chair upon the Hill of Tullahogue; and FYNES MORYSON tells us that Lord MOUNTJOY, who spent five days at Tullahogue in A.D. 1602, 'broke down the chair whereon the O'NEILLS were wont to be created,' it being a rude seat of stone placed in the open field."

It is well to remember that in theory at least the right to chief power was conferred by election. Less regard was given to primogeniture in Ireland than in most other places. The candidates would necessarily belong to the same family as the late chief, but the circle of those who were eligible was wide. As jealousy prevailed in families, and contests between neighbouring districts were constant, the election of a chief was not a rare occurrence. MOORE asserts that among the supreme kings of Ireland prior to the introduction of Christianity, not one-seventh died a natural death, the remainder were slain in battle or murdered. In the principalities, septs, or clans the chief power was equally uncertain in its duration. It was, therefore, advisable to have something permanent, if only a big stone, to serve as a throne or hallowed spot, and one would be used by so many chiefs in the course of a century, an immense number of associations would quickly gather about the stone and impart a peculiar character to the rough mass. As the head of a sept on his election could divide the whole of the lands at his discretion, the Coronation stone would be a symbol of his power over the earth's surface, and one, too, that was not inapt, for at the present moment it will be found that boulders which are relics of the Glacial Period encumber many parts of the island.

Every three years it is supposed there was a general convention of the princes or chiefs at Tara. Sometimes, however, there were intervals of a century or more between the gatherings. The Lia Fail or Stone of Destiny stood there. That stone was reported to have been carried to Scotland by FERGUS, the son of ERC, when he founded the colony now known as Argyle. It is difficult to believe that a stone to which so much virtue was said to be attached could be removed at an early period. It is more likely that the stone which is now in Westminster Abbey was not derived from Tara, but from some other part of Ireland. The mysterious properties for which the stone was valued beyond its use in rites, such as roaring under the feet of a true king, cannot have been more than jugglery. The tradition that the Lia Fail once served as JACOB'S pillow, and was carried in the migrations of some of the tribes of Israel, is not supported by any Irish legends. Nor is the legend about its possession by a Greek who found his way to Spain, Ireland and Scotland more credible. MOORE says the parallel to the Lia Fail is to be found in the atioze, or silvery stone of the Persians, to which a similar charm, in the choice of their kings, used to be attributed by the Magi.

There is probability for the version which supposes that the stone was prized in Scone because it had been used as a pillow by St. COLUMBILLE. There is a boulder in Iona which is described as Columbcille's pillow, but, as Mr. O'REILLY says, "It is, however, exceedingly doubtful that the latter would have been left upon the island when his relics were removed from it to Ireland and the mainland of Scotland in the early part of the ninth century, to secure them from the Norsemen, who then frequently

attacked and plundered Iona." Dean STANLEY considers the theory of the saint's connection with the stone reasonable, "and if so," he adds, "it belongs to the mass of the first authentic Western consecration of a Christian prince—that of the Scottish chief AIDAN."

As archæology has failed to throw light on the origin of the stone the aid of science has been invoked. In 1851 Dr. MACCULLOCH, the geologist, described the stone as a calcareous sandstone, exactly resembling that which forms the doorway of Dunstaffnage Castle. Professor R. S. S. says the stone is "a dull reddish or purplish sandstone containing a few embedded pebbles." Sir A. GEIKIE is of opinion that while stone of the kind exists in the Scottish coast of Argyle, and the stone is almost certainly of Scotch origin, and quarried out of some of the sandstone districts between the coast of Argyle and the mouths of the rivers Tays and Forth, there is no geological evidence to show that the stone not have been taken from the neighbourhood of Dunstaffnage itself, though it closely resembles the reddish-purplish sandstone of Dunstaffnage. There is red sandstone in Ireland, but it is met with mainly in Munster, and is not within many miles of Tara. There are some who believe in the North of Ireland, the part which would be nearest Scotland, but they do not crop out, and would therefore be available for men who were ignorant of geology. The question whether the sandstone is of English or Irish formation is therefore hard to determine, but a geologist finds little difficulty in concluding, while the late Director of the Geological Survey, that the stone was derived from somewhere near Scone. The scientific evidence should, however, explode the belief that the stone was used as a pillow by JACOB. The conclusion which Mr. O'REILLY comes to is practically a compromise, and follows:—

I would suggest that when Aidan, the first Christian monarch of this line of Scotie kings, determined to have himself inaugurated on Iona, a place at which no Scotie chief had yet been crowned, he might well think it prudent to conform as far as possible with the custom of his ancestors, and endeavour to retain in some degree a portion of the ceremony which his inauguration might seem to lack legality in the eyes of the people's eyes, and for that purpose might have had come to Iona a slab which had either been originally brought from Ireland or had else been quarried out of the sandstone of Dunstaffnage, on which his ancestors were probably inaugurated, and the slab thus brought to Columb's monastery might have remained there and have become known as "Columb's pillow," which afterwards was divided between the Columban churches of Ireland and Scotland at the partition of his relics in the ninth century. This suggestion seems to be a not impossible explanation of the existence of conflicting traditions that indicate a dual connection between this stone and Dunstaffnage and Iona, making it at once the "pillar-stone of Columb," the inauguration-stone of pagan chiefs who lived before the Christian time, and of the veneration with which it must have been regarded when King Kenneth deposited it at Scone, and the custom of crowning the Scottish kings upon it. If this explanation of the existence in Ireland of other red stones connected with the tradition with St. Columbcille would also be accounted for, and if this suggestion should coincide with fact, King Eadgar who descends from Fergus Mac Erc and the latter's Dalriadan ancestors, when crowned next June at Westminster will be seated above a stone on which his remote ancestor King Aidan sat some 1,300 years ago when Columb, laying his hand upon his head and blessing him, inaugurated him on Iona.

When the stone was brought to England at the end of the thirteenth century the use which is about to be made of it was not contemplated. It was a trophy of victory, and was offered as such to the Abbey in order to serve a humble purpose of a seat for a chantry priest. According to Dean STANLEY, EDWARD I. ordered a chair to be made of the stone. When a desire was expressed for its return to Scotland there was, it is believed, a promise made to that effect. But it was without avail. There is evidence both that the stone were never much esteemed in England. Sir ROGER COVERLEY is made to express the opinion of the earl of Argyll of the eighteenth century when, after the cicerone had told the story of "Jacob's pillar," he asked "What answer they had to say that JACOB had ever been in Scotland." Instead of answering the difficult question the guide said the knight to pay his forfeit for seating himself in the chair. Sir ROGER whispered that their friend WILL WARRICK

d have contrived to get a tobacco stopper out of or other of the chairs. It is remarkable that about fifty ago FRANCIS WEY, the French writer, relates that a who was a member of his party also endeavoured to ate the chair, and he evidently shared in her annoy- when her knife was confiscated. He describes the as "assez sale et peu élégant," but, as he says, it has fine longevity for a wooden chair.

When it has served in the forthcoming ceremony, we something will be done to demonstrate to all visitors istoric importance of the stone apart from its mythic iations by preparing a different setting for it, but it d be a graceful act to return it to the country which most claim upon it. Why should Scotsmen still have dure the affliction of seeing an object so prized by retained in England in spite of the treaty of 1338 solemnly provided for its return?

## THE ENCYCLOPÆDIA BRITANNICA \*

VERY man who desires to witness an increase of human power must be glad when his encyclopædia nes obsolete, although it may involve a loss to himself. rk of that kind is at its best when it represents the e cycle of knowledge of the time when it was pre- l. In recent years the cycle has been widening st continuously, and yesterday's measurements may e applicable to-day. All classes of knowledge do not r to advance at an equal rate. But the extent of is stationary is decreasing. Even theology endeavours come expansive. Wherever investigation and experi- are applicable the law is progress, and as MACAULAY "a point which yesterday was invisible is the goal to- and will be the starting-post to-morrow."

he nine editions of the "Encyclopædia Britannica" e taken as recording the state of knowledge between and 1889. From the extent of the work and the ion of the alphabetical principle it would be more ct to say that the latest completed edition relates to a d between 1875 and 1889. For sciences which come the first letter of the alphabet, the results of the rs of students during a quarter of a century have to plained, and in some instances they are of marvellous rtance. It is, therefore, courageous on the part of the ctors of the tenth edition to assume that the readers ave recourse to the preceding edition, and hence it is sary to regard only what may be called the victories ence in its most comprehensive sense since 1875. lan adopted has the advantage of enabling students to themselves acquainted with the latest developments man endeavour in many fields without undergoing the r of considering those aspects of the subjects which ceased to possess more than an historic interest. will be evident from a brief glance at a part of the nts of the first volume of the continuation.

ne of the earliest articles we meet with is "Abyssinia." re informed by Count GLEICHEN that since 1875 st has shifted from the northern to the southern ces, and several new sources of information have opened to us. The history is brought down to 1901. "Royal Academy" is not generally credited with a progressive institution, but it has had to submit to iversal law of change. Laymen and Associates are allowed to hold offices which formerly were mono- d by Academicians. The number of Associates has raised to a minimum of thirty, and since 1884 they e placed on the retired list. The schools continue to rom 5,000l. to 6,000l. a year, and the average annual nt of pensions is about 2,000l. As usual the amount me is not stated. The number of works offered ibition has grown from 3,011 in 1868 to 13,462 in "Accumulators" have to keep pace with the ce of electricity. "Acetylene" with its applications

he new volumes of the "Encyclopædia Britannica," constituting ibination with the existing volumes of the ninth edition the dition of that work, and also supplying a new, distinctive and dent library of reference dealing with recent events and ments, the first of the new volumes being Volume XXV. of mplete work. Published by Adam & Charles Black, and the

may be mentioned as a subject which for the Encyclopædia is new, as it was only in 1892 that the process of making calcium carbide was discovered. "Acoustics" is a topic which has interest for architects, and the investigations up to the end of the nineteenth century are described. How they are to be turned to account in building has yet to be as- certainated. "Aeronautics" has received an impulse of late years, and photographs are given of the machines by M. SANTOS-DUMONT and others. "Africa" cannot now be regarded as the Dark Continent, for while in 1875 Great Britain possessed 241,461 square miles, in 1900 the British area was 2,713,910, and the influence of possession there makes for light. The French increase in area is more remarkable, for the respective numbers are 168,250 and 3,804,974. Nearly two millions, however, are called Sahara, which means much. There is a change suggested by the article on "Agriculture," for cattle are now recognised personalities, and have their photographs taken. Mathematicians will, no doubt, be delighted by the forty closely printed pages relating to "Algebraic Forms," by Major MACMAHON.

The subject of "America" will appeal to archaeologists, for the anthropology of the continent is dealt with by Professor O. T. MASON, of Washington. The ancient inhabitants have received much attention. Already it has been ascertained that there are nearly 200 linguistic families in America, embracing over 1,000 languages and dialects. Pictorial language appears to have been widely used from north to south. It is remarkable that no iron tools existed prior to the invasion of the whites. The immense buildings were erected without mechanical appliances. "The architectural Mexicans, Central Americans, and especially the Peruvians, had no derricks or other hoisting devices, but rolled great stones into place along prepared ways and up inclined planes of earth, which were afterwards removed. In building the fortress of Sac-sahuaman heights had to be scaled; in Teahuanaco stones weighing 400 tons were carried 17 miles; in the edifices of Ollantaytambo not only were large stones hauled up an ascent, but were fitted perfectly." The dwelling was dominated by the tribal system. Stone working was general; the sawing was by means of sand with a thin piece of harder stuff. There was much waste, but there was an unlimited supply of material. The metallurgy is a mystery which puzzled the Spanish goldsmiths. They contrived to make pottery without the aid of a wheel. Fine art was attempted, and in "the Valley of Mexico the human figure, animal forms, fanciful life *motifs* in endless variety were embodied in masks, yokes, tablets, calendars, cylinders, discs, boxes, vases and ornaments." Their great buildings are most impressive, although sometimes the mass of masonry to chamber space is about as 40 to 1. With so vast a field it is no wonder that organisations of explorers are engaged. Professor E. B. TYLOR deals with general "Anthropology," in which he treats at some length of the Tasmanians. He maintains that previous to their coming in contact with European settlers they were not the broken outcasts they afterwards became, but led a normal and not unhappy life.

The article on "Classical Archaeology" is by Professor PERCY GARDNER. He describes the explorations in Athens and other parts of Greece and in Rome. Not until the sixth century B.C. did art become definitely Hellenic. Professor GARDNER says an important fact is overlooked in the Darwinian search after origins, and most attention has been given to qualities which Greece possessed in common with other races in the same early stage of civilisation, for "in many respects the art of Greece is incomparable—one of the great inspirations which have redeemed the world from mediocrity and vulgarity. And it is the searching out and appreciation of this unique and ideal beauty in all its phases, in idea and composition and execution, which is the true task of Greek archaeological science." The article contains forty figures which will be novel to most readers. It is to be regretted that more examples of British success are not forthcoming, but the insignificant sums which are at the disposal of the explorers are not sufficient for great undertakings. The article on "Modern Architecture" is by Mr. STATHAM, who describes "Queen Anne" and its developments. In the course of it we are told that "the real cause of

failure, as far as modern architecture is a failure, lies partly in the fact that it is practised too much as a profession or business and too little as an art; partly to the deadening effect of public indifference to art in Britain." The American high buildings are recognised as a new contribution to architecture, but are said to be false, and may probably prove to be dangerous. Some foreign examples of buildings are also included. Mr. PHÉNÉ SPIERS treats of the archaeological discoveries relating to architecture in Egypt, Persia, Greece and Rome. He agrees with M. DE VOGUÉ in the conclusion that the Pointed arch was derived from Egypt and Assyria, and was employed by the Saracens in Sicily. In Palestine, prior to the crusades, while the doors and windows had circular arches, the vaults were pointed. Professor WALDSTEIN explains the results of the excavations by the Americans from 1892 to 1895 at "Argos." Mr. TILTON concludes that the image of Hera, which was the work of POLYCLETUS, including the base and throne, would be about 8 metres; the goddess herself 5.50 metres; the face, arms, feet and neck were probably of ivory, while the rest of the figure was draped in gold. There are articles on "Art Galleries," "Art Sales," "Art Societies," "Art Teaching," the last by Mr. W. CRANE, as well as one by him on "Arts and Crafts." Mr. J. B. BOURCHIER describes "Ancient and Modern Athens." Our readers will of course understand there are many other articles on technical subjects which are no less important, although they may be remote from construction.

The illustrations in the new volumes will not only be numerous, but more varied in character than in any cyclopædia with which we are acquainted. Some important paintings will be represented by whole-page copies. Efforts will also be made to suggest colour. The maps have the clearness and accuracy of those forming the *Times Atlas*. In the older editions it was the custom to keep the engravings separately, but by incorporating them in the text greater clearness is insured. The new encyclopædia is a vast undertaking, which requires the co-operation of at least 1,000 contributors, besides a staff of editors, departmental editors, associate editors and sub-editors. As a treasury for reference it will be unique, and for students who are business men it will be invaluable, since without loss of time they will be able to realise the latest and most advanced conclusions on every subject.

A work so colossal recalls the early attempts to produce "rounds of knowledge." It may seem incredible that the great French encyclopædia, which was believed to have been one of the agencies in bringing about the Revolution, was suggested by a simple dictionary of medicine by an Englishman named JAMES, which DIDEROT translated. Then he found there was another encyclopædia by EPHRAIM CHAMBERS, and he resolved to prepare one which should be superior to it in all respects. The first volume appeared in 1751, and six years afterwards the work was suppressed on account of its dangerous character. The volumes were printed surreptitiously, and were reprinted in other countries. It was not until Madame POMPADOUR was able to discover from the pages the difference between the rouge employed by ladies in Madrid and the rouge used in Paris that the danger of confiscation was removed. D'ALEMBERT abandoned the "Encyclopédie" through apprehension of a prison, and DIDEROT was advised by VOLTAIRE to flee to Russia in order to escape the stake. How unlike in its reception was the attempt to disseminate knowledge a few years afterwards in Scotland. The first edition of the "Encyclopædia Britannica" appeared in three volumes in 1771, and from that time the editions have grown in bulk and value to correspond with the progress of knowledge. Who can estimate the benefits conferred by the volumes on English-speaking races throughout the world? In its latest form the work realises the dream of D'ALEMBERT, which was to provide a sanctuary in which the knowledge acquired by men should be protected against the power of time and revolution.

**Mr. William Sterling**, who was assistant to the professor of architecture in University College, committed suicide at his chambers, York Buildings, Adelphi. He was an able designer, but did not gain the success he deserved. He was in his forty-first year.

## THE SOCIETY OF ARCHITECTS.

THE eighteenth annual dinner of this Society was held Friday evening last in the Banqueting Hall, Private Restaurant, Mr. Silvanus Trevail, J.P., president, in the chair. There was a large company, among whom were the Bishop of Southwark, Lord Monkswell, Sir W. B. Richmond, K.C., R.A., the Archdeacon of London, Sir Wyke Bayliss, F.R.S., Major-General Hamley, C.B., the Hon. W. F. Massey, M.P., Alderman Sir William Treloar, the Mayor of Lambeth, St. Pancras, Stoke Newington, Camberwell, Shoreditch, Chatham, Rochester, Battersea, Bethnal Green, Finsbury and Fulham, Judge Rentoul, Col. F. J. Hext, T. P. O'Connor, M.P., Mr. W. A. McArthur, M.P., Mr. Edward Hain, M.P., Mr. Thomas B. Bowring, Mr. Edward Terry, General Manager of the London and South-Western Railway, Mr. Noel T. Kershaw, the Worshipful Master of the Company of Carpenters (Mr. John Wilson), the Electrical Engineer of the London County Council (Mr. J. H. Rider), the President of the Bristol Society of Architects (Mr. F. W. Wills), Mr. Wm. A. Hart, Mr. J. Barr-Robertson, Monsieur Van Houtte, Mr. C. A. V. Conybeare, Mr. Charles H. Collier, Mr. Robert B. Huxham, Mr. Rashleigh Phipps, the Worshipful Master of the Company of Tylers and Bricklayers (Mr. Ellis Marshall, hon. secretary), Mr. E. Farman (solicitor to the Society), W. C. Williams, Mr. L. Schlenheim, Mr. Arthur E. Cornish (city engineer, Norwich), Mr. G. Gard-Pye (vice-president), Mr. John E. Veale, J.P., Mr. William Digby, C.I.E., Mr. Abraham Cohen, Mr. Harold Oakley, Mr. William Beck, Mr. Douglas Archibald, Mr. Frederick B. Hollis, Mr. G. Bertini, Mr. H. W. Bacon, Mr. J. S. Hesselstine, Mr. John Cutler, Mr. L. A. Atherley-Jones, M.P., Mr. E. J. C. Morley, M.P., the General Manager of the Peninsular and Oriental Steamship Company, Mr. Walter H. Harris, C.M.G. (ex-sheriff of London), Mr. H. H. Bartlett (ex-president Master Builders' Association), the Clerk of the London County Council (Mr. G. L. Gomme), President of the District Surveyors' Association (Mr. B. Tabberer), the Superintending Architect of the London County Council (Mr. William E. Riley), Mr. W. Thomas (vice-president), the President of the Institution of Builders (Mr. William F. King), Dr. H. G. Walker, Mr. P. A. Gilbert Wood, Mr. T. R. Featherby, Mr. R. D. Bach, Mr. G. E. Bond, Mr. John Lanyon, Mr. Alfred Curran, Mr. Frank Dodd, Mr. John D. Mason, Mr. H. C. Sedgwick, Mr. W. Hofer, Mr. Maurice Strauss, Alderman C. Skinner, Councillor J. D. Driver, Mr. C. Day (borough surveyor, Chatham), Mr. H. G. Quartermain (hon. treasurer), Mr. T. Walter Emden, L.C.C. (ex-president), Mr. J. R. Manning, Mr. W. R. Manning, Mr. E. L. Fearn, Mr. W. E. Fearn, Mr. J. H. Richardson, Mr. Edward Cornish, L.C.C., Mr. Joselyn Brandon, L.C.C., Alderman Jno. Gleeson, Mr. Cromwell Edwards, Mr. R. W. Roques, Mr. John Stead, Mr. R. H. Cabell, Mr. Albert E. Fridmore, Mr. D. L. Fox, Mr. J. Richardson, Mr. O. Marsland, Mr. C. Palmer, Mr. H. H. Richardson, Mr. Ernest C. Isborn, Mr. Charles Chubb, Mr. W. R. Pertwee, Mr. A. F. Goddard, Mr. F. V. Fox, Mr. John R. White, Mr. John H. Champness, Mr. W. Tucker, Mr. C. D. Collins, Mr. E. A. Scanes, Mr. T. G. Jones, Mr. H. Prosser, Mr. T. R. Richards, Mr. R. G. Bare, Mr. John W. Dyson, Mr. Fred. Foster, Mr. Philip Condy, Mr. Herbert Warren, Mr. Frank C. Warren, Mr. E. H. Dring, Mr. H. C. W. Blyth, Mr. R. H. Spalding, Mr. John B. Maxwell, Mr. John Brewer, Mr. J. H. Bartlett, Mr. Walter Symonds, Mr. John Roberts, Mr. George Lory (secretary of the Local Cornish Association), Mr. R. A. J. Bidwell, Mr. R. Clifton, Mr. Clifton R. Davy, Mr. W. E. Wright, Mr. Charles E. Jackson, Mr. W. R. Mallett, the President of the Manchester Society of Architects (Mr. A. Darbyshire), the President of the Master Builders' Association (Mr. C. J. Lohmeyer), Mr. Arthur H. Pethick, Mr. Bernard Strauss, Mr. W. Cooper, Mr. L. F. St. John, Mr. Edward Keenor, Mr. C. Mason, Mr. A. H. Scott and Mr. C. McArthur Blount (secretary).

The President proposed the toast of "The King," which was received with enthusiasm and passed with musical honours.

The second toast, "Queen Alexandra, their Highnesses the Prince and Princess of Wales, and the Members of the Royal Family," was also proposed by the President, Signor Bocchi's orchestra rendering "God Bless the Prince of Wales."

Sir W. B. Richmond, R.A., proposed "Minister of Religion." He said there were probably no men who worked harder than the clergy. That they had in their time committed errors nobody could doubt, sometimes in theological matters, sometimes in matters of taste, but the whole basis of their influence upon the world had been for good, because at the root of their teaching there was one paramount truth, and that was love. The growing necessities of a poorer population demanded from the officers of religion much greater influence in the direction of charities than they were able to promote in the interests of art. The church is a

did much good work, but it was doubtful if it did as much for the interests of the general population, and especially the clergy and ministers of religion were to-day. He recommended that religion should be based on the purity and simplicity of the designs employed in church building.

The Bishop of Southwark, who responded, said they were not, he believed, because they claimed to be the architects of the morality and the character of the English nation. It was true that their methods of building and their canons of architecture did differ and vary even among themselves. The object, however, of each section and division of the clergy was to elevate the people to the ideal. This could only be accomplished by unity of action. The unity of religion would come about by a militant attitude of section against section, it would not come from voices railing down the ideal of the opponent and imputing wrong motives to one man's work, but it would come from the intellectual attitude of mutual respect, which meant respect for one another.

Archdeacon Sinclair, who also responded, said he was of the opinion that the toast was proposed by the sympathetic mind of Sir John Richmond. The architects had suffered at the hands of the clergy. Sometimes the vast schemes of architects were cut and cut short partly from ignorance on the part of the clergy and partly from want of money; more often it was the lack of funds. There was a conference held some time ago for the complete rebuilding of the parish church at Islington. A design was submitted by Mr. Reginald Field, but his first scheme would have cost 30,000*l.* to carry out, a sum of money far beyond what was likely to be available. After various changes the design was adopted. In carrying out the building it was not absolutely necessary for one generation to finish the whole of their church in a few years. There could be a noble plan, the progress of work ruled by time and money.

Mr. Frank Dodd submitted "The Houses of Parliament," and with the names of Lord Monkswell, Hon. Massey-Mainwaring, M.P., and Mr. E. Hain, M.P.

The Hon. Massey-Mainwaring in his response said that as architecture was concerned in reference to the House of Commons, the members of that house had to thank architects for the magnificent building they had given them. It was true that there was no more glorious edifice to look at than their Houses of Parliament, but inside the arrangements were not altogether satisfactory. Sanitary measures and ventilation did not seem to have been insisted upon in the construction. All must have been a strong feeling when they considered that out of the building emanated all the power and greatness of the State.

Mr. W. A. McArthur, M.P., proposed "The Imperial Palace of the Empire." Major-General Hamley, C.B., and Mr. F. J. Hext responded.

Mr. T. P. O'Connor, M.P., gave the toast of "The London Architectures," coupled with the names of Alderman Sir William Carter, Mr. G. L. Gomme, clerk to the London County Council, Mr. E. Barnes, J.P., mayor of St. Pancras, and Dr. White, mayor of Lambeth.

Mr. Wyke Bayliss, in proposing the toast of the evening, "The Society of Architects and Architecture," said he counted it very happy thing for architecture that the control of the art was in the keeping of architects themselves. Pure architecture, as art, had always suffered when it had been controlled by religion. The Parthenon was not conceived by the mind of a priest, nor was Westminster Abbey. The painter thought in two dimensions of space. The architect thought in three dimensions, the solid, with three dimensions of space. The work of the painter was set with colours of his own choosing, but the work of the architect was set by the chemistry of the materials, or should be, at their best when he had finished his work. The palette of the architect was set by the chemistry of the materials which began when he left off. Chartres Cathedral was as beautiful to-day than it had been before. Nature had been painting it for 600 years or more. This did not mean that it was better than another. It showed that the two arts were different, and they must therefore be treated and judged differently. The Society had that day been visiting a great architect, and he would like to put on record an incident connected with one of the founders of it—the late Cardinal Manning. His Eminence was one day looking through with great interest at a folio of sketches of Italian churches, but it was not until he came to St. Peter's that his heart was thoroughly drawn out. He said that the secret of his admiration for that church lay in its clearness, simplicity and unity—one great hemisphere surmounted by one great hemisphere. That was all, but it was enough. This idea of Cardinal Manning corresponded closely with the original conception of Michel Angelo. The architect had something more to do than to hop over a line of paper with a pair of compasses like a devil on two wheels. He carried something more than a 2-foot rule. The architect of the cathedral of St. Peter's expressed this:—"So I built me with the measuring-rod of the Seventh Angel, and Paradise measured the walls of the new city of God."

Was the angel with measuring-rod seen by St. John really Michel Angelo, who, having served his apprenticeship on earth, found fulfilment in heaven?

The President, in his reply, thanked the many representative men who had gathered around him that day, particularly the metropolitan mayors who had shown their sympathy with architecture. As regarded the needs of London, he did not go back one iota from the improvements suggested in his presidential address of last year. London, with all its wealth, size and importance, was still a city not up to its privileges. They were, however, beginning to improve London by building new thoroughfares. When the authorities had accomplished a little of this improvement they would see how much more there was to do. Rome was not built in a day, and he was full of hope when he saw the beginnings of advance. He was glad that the mayors were there backing up by their presence the architects who had suggested the improvements. His criticisms were made in a no unfriendly spirit, his sole desire being to bring London to a par with such examples afforded by Vienna, Paris and American cities. In the matter of street improvements the architect played an important part. Their Society wished to raise the standard and qualifications of all architects. They had promoted a Bill in Parliament to raise the standard of the profession by registration. The adoption of the measure deserved the assistance of all authorities in the interests of the public generally as well as those of the profession of architecture.

Mr. A. Darbyshire, president of the Manchester Society, also responded.

Mr. W. Scott Scott proposed "The Arts and Crafts Allied to Architecture."

Mr. W. F. King responded.

Mr. W. W. Thomas gave "The Visitors."

Mr. W. Digby responded.

The dinner came to a conclusion, and the guests with great vigour joined in singing "Auld Lang Syne."

## THE LATE THOMAS OLIVER.

ON April 24 Mr. Thomas Oliver, architect, died at Newcastle-on-Tyne, in his seventy-eighth year. The son of an architect, he was trained in the art and set up at first in Sunderland in 1847. Eleven years later, on the death of his father, he went to Newcastle. His practice was extensive. Among his buildings are the Prudhoe Convalescent Home, Whitby, the Saltburn Convalescent Home, the North Riding Infirmary, the Mechanics' Institute, Newcastle, and a number of Board schools at Newcastle, Gateshead, South Shields and throughout the northern district. Many churches were built and restored under his direction, and in the early part of his career a number of chapels were erected from his designs. In addition he was architect of many public institutions and private residences. Mr. Oliver was the founder of the Northern Architectural Association, and was its first secretary—a position he held till 1870, when he was elected president. In 1872 he again took up the duties of secretary till 1876, and for the next three years he was president. In 1883 he again held the position of secretary. He afterwards declined office. He was presented by the Association with a gold watch and chain on his election as president in 1877. He entered into partnership with Mr. R. J. Leeson in 1879. He was a widower, and had been twice married. He leaves one son (Mr. Geo. Dale Oliver, of Carlisle, county architect for Cumberland) and five daughters.

The Prince and Princess of Wales visited the galleries of the Fine Art Society, in New Bond Street, to view the exhibition of Mr. Briton Rivière, R.A.'s, drawings of animal life, and Mr. A. Wallace Rimington's collection of water-colours of England and Spain.

Mr. William Mather, M.P., has offered to present to the Gordon Memorial College at Khartoum the complete equipments necessary for the establishment and organisation of departments for manual training and technical instruction. These equipments will consist of machines and hand-tools for wood and metal-working, a small foundry and forge, a boiler and steam-engine, a dynamo to generate electric current, and electric motors to drive the machine tools, pumps and hydraulic appliances, &c. The object and design of these departments will be to promote classroom studies of natural science and general knowledge, with a view to giving the Soudanese boys now being trained in the primary schools such a practical education beyond the preliminary stage as shall enable them to apply their knowledge to the development of the natural resources of their country.

## NOTES AND COMMENTS.

THE restoration of the Market Cross of Chichester was again considered at the meeting of the Town Council on Friday. The Mayor proposed that the work required on the structure, which is at present in a dangerous condition, should be undertaken as a memorial of the Coronation, and that the funds should be obtained by subscription. One member recommended the substitution of copper bars and bolts instead of iron, as the extra cost would not be more than 100%. Another councillor said the cross was an obstruction, and it ought to be removed to a position where it would be less of a danger, a suggestion which other speakers described as monstrous and deserving of condemnation by the civilised world. If the cross is so important it is strange so little care was taken to preserve the masonry. Eventually it was decided to make an appeal throughout the district for subscriptions towards the cost of restoration, which will amount to 450%.

A QUARTERLY meeting of the Royal Society of Antiquaries of Ireland will be held in Dublin on Monday next, when the following papers will be read:—"Notes on Three Bone Pins found at the bottom of Ballinderry Lake, co. Westmeath;" "High Crosses and Abbeys in Leinster and Munster;" "Stone-Age Settlements in Meath;" "The Giant's Grave, Loughloughin, near Broughshane, co. Antrim;" "The Inquisitions taken on the Death of William, Earl of Ulster, A.D. 1333, and the Occupation of Connaught by the Anglo-Normans." They suggest that a wide field yet remains for the exercise of the energies of archæologists. On Tuesday there will be an excursion to Slane, co. Meath, where there is much which is interesting within a limited area. The place is said to have been known as Ferta Fear Feic, from trenches and earthworks formed for burial in Pagan times by the slaves of FECCOL FERCHERTNI, a heathen prophet. ERC, son of DEG, a bishop and brehon to St. PATRICK, established a hermitage in Slane about 540; a monastery, college and seat of a bishop were founded on the traditional spot where St. PATRICK lit his pascal fire, visible at Tara. The monastery was several times ravaged by Norsemen from 833 to 1170. Its round tower, full of people and relics, was burned 948, the Danes, under their leader BLACAR, having suffered a severe defeat and lost 1,600 men the year before. The English, under RICHARD FLEMYNG, built a castle in Slane about 1175. The see was merged into the Bishopric of Meath in 1216. In 1513 the present college and monastic church were rebuilt for Franciscan monks by CHRISTOPHER BARON, of Slane. On the river Boyne currachs resembling the ancient canoes may still be seen.

THE trade-union policy of interfering with the interests of individuals, whether members of a society or outsiders, has not met with much favour of late in the law courts. A case heard at Manchester before Mr. Justice WILLS is the latest indication of the spirit which now prevails among judges. The plaintiff, JOSEPH THOMAS, is a joiner, and he sued the Amalgamated Society of Carpenters and Joiners for unlawfully procuring his dismissal from employment. In 1900 plaintiff applied to become a member of the Society, and paid a fee. For a time he was compelled to accept work in a non-union place. Afterwards he sought full membership when he was able to pay the full payments, but in vain. He was at work when a deputation of delegates waited on his employer, and announced a strike unless THOMAS was dismissed. The employer reluctantly complied. Since December 1901 THOMAS could obtain work for no more than a fortnight. Mr. Justice WILLS said the question for the jury was whether the action of the delegates was taken to promote the legitimate interests of the society or vindictively to punish the plaintiff for having taken piece-work. The jury found for the plaintiff and assessed the damages at 100%. The injunction was also granted restraining the society from interference with the plaintiff.

## ILLUSTRATIONS.

## NEW DINING-ROOM, COWLEY MANOR.

VERY large and important alterations and additions have for the last two years been carried on, and are now nearly completed, at the above interesting old manor house, in the grounds of which is the source of the river Thames. The drawing illustrated shows the treatment of the new dining-room, a room 42 feet by 23 feet. The panelling, doors and chimney-piece are of Cuba mahogany, the carved swags and shields being of lime-wood. The work has been carried out by Messrs. H. H. MARTYN, Cheltenham. The heavily-enriched plaster ceiling and frieze above the panelling have been executed by Messrs. G. JACKSON & SONS, of London; and Messrs. CLEMENS JEAKES & Co. carried out the heating work. The general contractors were Messrs. J. PARNELL & SON, of Rugby. Mr. R. A. BRIGGS, F.R.I.B.A., of 12 Norfolk Street, Strand, W.C., was the architect, from whose designs and under whose superintendence the work was carried out.

## ALTERATIONS TO CHURCHYARD, ST. ANDREW-BY-THE-WARDROBE, QUEEN VICTORIA STREET, E.C.

THE artistic treatment of the open spaces of the City and more especially, perhaps, of disused churchyards, has added most materially of late years to the convenience and pleasure of those whose daily round of toil is spent within the restricted area of "the square mile." The churchyard of St. Andrew-by-the-Wardrobe, Queen Victoria Street, was originally unseen from the street, its growth of pretty shrubs being obscured by a high brick wall. This obstruction has been removed and the space thrown open to the street. Our illustration shows the alterations that were projected in connection with the churchyard. The original design, which is the work of Messrs. BANISTER FLETCHER & SONS, architects, 29 New Bridge Street, E.C., has not been carried out in its entirety owing to the cost of the work. The illustration shows a rearrangement of the existing steps by the formation of two flights of side steps and the construction of a balcony, the lower portion of which would form an alcove, while the upper part would provide an open space available for seating accommodation. The present arrangement is, however, confined to the removal of the existing ugly brick wall and the erection of stone gate piers and wrought-iron railings in consonance with the general design of the church. The ground behind the railings has been sloped up to the terrace in front of the church itself. This ground has been turfed and laid out as a garden. The fountain shown in the sketch also forms part of the original design.

## MESSRS. GOSLETT'S PREMISES, 127, 129 &amp; 131, CHARING CROSS ROAD, W.C.

THESE new premises have recently been erected on Charing Cross Road for Messrs. GOSLETT, the well-known builders' merchants. The site has a frontage of about 53 feet and a depth of about 40 feet. The materials used are Portland stone and red brick facings, and the roofs are covered with green Westmoreland slates. As to the exterior, the ground and first floors have been grouped together, and an attempt has been made to make the portion as bold as possible; they serve to indicate the showrooms. On the upper floors are the offices and showrooms. The general contractors were Messrs. LAWRENCE & SONS, who have most efficiently carried out the design. Mr. GILBERT SEALE is responsible for the carving to the main cornice. Messrs. WAYGOOD supplied the hydraulic lift, the N.A.P. Window Company supplied the steel casements. Mr. BANISTER F. FLETCHER, A.R.I.B.A., was the architect.

## LUNTREATH CASTLE, STRATHBLANE, N.B.: DINING-ROOM BILLIARD-ROOM.

## CATHEDRAL SERIES.—RIPON: VIEW OF THE SOUTH SIDE OF THE NORTH SIDE OF THE NAVE, SHOWING DOUBLE BUTTRESSES.

# THE ARCHITECTURAL ASSOCIATION.

MEETING of the Association was held on Friday, the 25th ult., Mr. G. B. Carvill, vice-president, in the chair. It was announced that Mr. C. Harrison Townsend had been elected a member.

The following donations to the New Premises Fund were received:—Mr. W. H. Lever, 25*l.*; Mr. John Murray, 10*l.* 10*s.*; Henry White, 10*l.* 10*s.*; Mr. C. de Gruchy, 5*l.* 5*s.*; E. J. Rider, 5*l.* 5*s.*; Mr. L. Jacob, 3*l.* 3*s.*; Mr. E. J. Taylor, 2*l.* 2*s.*; Mr. Francis R. Taylor, 2*l.* 2*s.*; Mr. A. C. Selby, 1*l.* 1*s.*; Mr. T. T. G. Donaldson-Selby, 1*l.* 1*s.*; Mr. H. Flower, 1*l.* 1*s.*; Mr. A. T. Griffith, 1*l.*; Mr. H. W. H. Paton, 1*l.* 1*s.*; Mr. H. C. Strange, 1*l.* 1*s.*; Mr. Horace White, 1*l.* 1*s.*; Mr. C. H. Vernon, 1*l.* 1*s.*; total subscriptions to date, 145*l.* 6*d.*

E. A. GRÜNING read a paper on

## Arbitrations.

I have had the honour of being invited by your committee to read a paper on "Arbitrations." This I do willingly; but I have written books and read papers on this subject for many years, and I therefore propose to speak simply on arbitration from the architect's point of view, and to confine myself to such as may occur in the ordinary practice of an architect. I propose also not to go too deeply into the question of precedents, or of law. In fact, as far as possible, to confine my remarks on the knowledge I have personally gained from my practice.

Arbitration was really the earliest species of law. In early times the king or head of a tribe was the arbitrator in civil and criminal cases. True, he had extraordinary powers, which his successors at the present day do not possess, and sometimes I cannot help thinking it would be a mercy if he did, and were able, in the same way and by the same means, to shorten cases which are otherwise very protracted. In course of time law superseded arbitration, but a custom set in, by which arbitration has become more than a merely recognised means of settling disputes, being now clothed with legal powers, which until recently did not exist. Although many arbitrations had taken place under agreement, the beginning of this change arose with the legislation of the Law Procedure Act of 1854. But the Arbitration Act of 1889 did more than anything to put arbitrations on a legal basis, and to invest them with a dignity and importance till then they had not possessed. Without going into the detailed provisions of this Act, it may be said that the arbitrator has all the powers of a judge of the High Court, the power of committal to prison for contempt of court, and proceedings are as strictly defined as those of the courts. An arbitrator cannot be deposed except for misconduct or corruption. The object of arbitration is, or should be, to simplify the settlement of disputes. The arbitrator should be an expert in the subject which he has to decide, the object being to avoid waste of time in informing him of the customs of professions and trades, and bringing evidence necessary to prove such matters, which he should of his own knowledge be able to decide upon at any such evidence. Arbitrations, too, should not, if possible, be allowed to involve questions of law, and if they do arise, are better dealt with direct by the courts, though I shall afterwards show how an arbitrator can deal with them in case of need.

There are three classes of arbitration—first, with two arbitrators and an umpire, the decision of the umpire alone being necessary; secondly, where the decision of the umpire in conjunction with one of the arbitrators is necessary; thirdly, where there is a sole arbitrator. With regard to the first, excepting cases to which we shall refer hereafter, it is desirable to have two arbitrators and an umpire, unless the arbitrators conduct the case on behalf of their respective clients. It is not so if counsel or solicitors are employed, and in such cases the two arbitrators merely sitting with the umpire is practically more ornamental than useful. Under the third head there is only one class of arbitration, namely, that of party walls, under the Metropolitan Building Act of 1894. It is necessary that two of the three surveyors should be awarded. Under the third head, where there is a sole arbitrator, this is in many respects the best method of arriving at a rapid decision on the points in dispute.

The matters which come to the arbitration of an architect are of two kinds—party walls and structures; and I use the word surveyor in the sense in which Christopher Wren was surveyor to the fabric of St. Paul's, which has been held by his distinguished successors to the present day—can be classed as follows:—

Party walls under the London Building Act of 1894; party structures; questions arising out of the various Acts and amendments thereto; questions relating to party walls; building contracts; dilapidations; professional relations between architect and client, and compensation cases. Under this head would be included insurance claims.

With regard to the dangerous structures, this is a new

form of arbitration, arising under the Act of 1894. Formerly all such cases were under the jurisdiction of and were tried at the police-court of the district. It is now open to any one conceiving himself aggrieved by the receipt of a dangerous structure notice to give notice under Part 9 of the Act, provided he does so within seven days, requiring the matter to be referred to arbitration, and Clause 107 of the Act prescribes the method in which this shall be done. It is practically a repetition of the procedure in party walls, with the exception that the award is signed by the arbitrator or umpire only. In this case, if the owner of the alleged dangerous structure does not demand within seven days after service of the notice the appointment of an arbitrator, the matter reverts to the police-courts, as under the former Acts.

We now come to arbitrations on questions of light and air, by far the most difficult of any with which an architect or surveyor can be called on to deal. The state of the law on this subject could not be more unsatisfactory than it is, owing to the conflicting decisions of various judges and the reversal of the judgments of the Court of First Instance by the Courts of Appeal—notably in recent cases. Efforts are being made to obtain a revision of the law as to easements of this class by a joint special committee appointed by the Royal Institute of British Architects and the Surveyors' Institution, with the assistance of two eminent King's Counsel. A Bill will be introduced into Parliament, we hope, in the current session, and I think every one will wish it success in simplifying matters of such great complication and difficulty. The main principles of the proposed Bill are settlement by arbitration, the proceedings being similar to those under the Factory Acts; the elimination of extravagant claims for special uses of ancient lights; the extinction of claims of this class in future buildings not already possessing ancient lights, and the simplification of means of objecting to such rights being acquired by the simple means of giving a statutory notice of objection instead of the present cumbersome and barbarous means of erecting and maintaining screens or other physical obstructions. Arbitrations under this head arise under different circumstances. The arbitrator or umpire may be appointed by agreement; he may be appointed by the judge of the Court in which the case is tried, or he may be required simply to report to the judge his independent opinion of the case. In this sense he is practically an arbitrator, inasmuch as the judge would probably, and in nearly every case, give his judgment in accordance with such report if confined strictly to questions of fact. The duties of the arbitrator here are very wide, and he can and should often do much to bring the parties together by suggesting a reasonable compromise, either by the modification of the defendant's proposed building, by reasonable compensation for the injury likely to be inflicted, or often successfully by suggesting an improvement to the plaintiff's building—of course, in the latter case to be carried out at the expense of the defendant.

The next class we have to deal with are dilapidations. These are more strictly matters of account. The repairing clauses in leases and agreements are often vague, and it is, therefore, often difficult to arrive at a decision. The arbitrator must determine on the items of claim which he intends to allow, and after that price them according to the best of his knowledge.

A more delicate question than that arising between architects and their clients cannot be conceived. Often these cases are painful to hear, and to decide; they usually take the shape of an alleged overcharge on the part of the architect, resisted by a counterclaim for his negligence, and damages arising therefrom. The procedure is the same as in other arbitrations, but in this—more than in any other class of cases—there is apt to be personal feeling and recrimination. In my own experience most such cases arise where the so-called architect is not a member of the Royal Institute of British Architects, but nevertheless attempts to use, and often to unduly interpret and strain to the utmost the schedule of professional charges.

With compensation cases the architect has comparatively little to do. These claims generally arise with reference to properties taken under the authority of an Act of Parliament. They may arise as a consequence of damage caused by the construction of neighbouring buildings or works, both as regards structural damage and consequential injury; and there may be other causes of complaint. But, as a rule—and particularly as to compensation for compulsory purchase—these are left in the hands of surveyors or agents, pure and simple. I mean agents dealing with properties and accustomed to assess the value of land, and the rental values of land and buildings. I am sorry to say that, with the occasional exception of the plaintiff's case in actions for injury to light and air, there is no class of arbitration or trial in which such exaggeration takes place as in compensation cases. This would seem to arise under the idea that a jury or an arbitrator would average the claims made against the counter offers. It appears often in these cases quite impossible to give conscientious evidence, as that would be of no use to the party represented. In fact, the witnesses too often consider that they are advocates

rather than experts. A well-known judge once remarked that there were three classes of witnesses—the truthful, the perjurer and the professional expert.

With regard to the duties of arbitrators and umpire. Should arbitrators be employed, their duty is to prepare each his own case: to boil it down and simplify it so as to only produce the salient points of real importance at the hearing. I have already said that arbitration is intended to simplify the settlement of disputes, and I cannot too strongly advise anybody engaged in this class of practice to be most particular and most careful in preparing the case for his side, fully setting forth his case without bias or exaggeration. More than this, he should, if he can, endeavour to ascertain and to work out the opponent's case so as to be ready to meet his opponent's arguments. He should have every drawing, every paper that he has to produce during the case, readily accessible and at hand, in order to avoid waste of time. In party-wall cases, before the third surveyor is called in, accurate drawings should be made of the wall, both in plan, elevation and section. The wall should be plumbed to ascertain how far, if at all, it is out of the upright; and the nature of the materials of which it is composed should be, as far as possible, ascertained. The surveyor to the building owner should also be prepared to state exactly what he really proposes to do, which cannot always be disclosed by the statutory party-wall notice, as this has to be given in advance, and it is not always possible at first to ascertain the exact circumstances of the case and condition of the structure in question.

Now in speaking of the duties of arbitrators as such, where there is an umpire, I may as well say that under this head I include the duties of architects or surveyors who have to prepare their side of the case for hearing. In all of these cases the same care should be taken in preparation—no points should be overlooked, and the points likely to be raised by the opposite side should be foreseen. The two architects, whether acting as arbitrators or not, should before the hearing agree facts as far as they possibly can; they should verify each other's drawings. In cases of light and air they should prepare a model, to be jointly agreed upon by both parties, and they should do everything to avoid disputes as to fact at the hearing, so that time will not be wasted in producing a lot of evidence to prove anything which ought not to require proof at all.

With regard to the Factory Acts, arbitrations are a procedure of comparatively modern form. They arise out of the operation of the original Factory Act and of numerous amendments of such Act, and are confined to determining the necessary provision for means of escape in case of fire, and to certain sanitary arrangements, both of which appear formerly to have been much neglected. Many difficult cases arise, owing to practical considerations, and the necessity of obtaining rights of way or access to the premises of neighbouring owners. I must say that the London County Council, as the statutory authority, though gradually improving in this respect, sometimes render these matters very difficult to decide by incorporating in their notices requirements, conditions and provisions with which it is absolutely impossible for the owners of property to comply. But that procedure of some sort was imminently necessary is quite clear. These questions bear very hardly on owners of property, who might in many respects be more leniently dealt with than they are at present. In this case the presence of umpire and two arbitrators is necessary at the hearing. The parties may or may not be represented by solicitors or counsel. The decision, however, rests solely with the umpire. As in all other cases, there is an appeal to the courts, but this appeal can only be on points of law and the validity of award, but not upon the facts as originally decided.

Troublesome matters are arbitrations arising out of builders' contracts. Here, again, much can be done to shorten a reference by agreeing beforehand to such items as possible, and also by agreeing in what order the claim and counterclaim, if any, should be taken, so that in case of need an interim decision may be given, shortening disputes only too likely to be prolonged. It is no unusual thing for the hearing of an arbitration on a building contract to last for any time from twenty to forty days, when anything that either party might have gained is completely swept away by costs. In these protracted cases nearly always personal feeling is introduced, which does not tend to promote a rapid settlement. Under the form of contract now in general use, the arbitration can only be opened after completion of the works, or when either party is dissatisfied with the architect's final certificate. But there are many cases in which much friction can be avoided and time saved by a hearing during progress of the works. The architect of a building must always remember that he is not only the agent of his client or employer. He must also during progress of the works, as above mentioned, hold the scales of justice between employer and contractor. Questions as to material and workmanship may arise which it is difficult to determine later on, when much of the constructive work has been covered up.

As to dilapidation arbitrations, I think I have already said nearly as much as I need. These rarely get into the courts; they are generally settled by the surveyors on behalf of claimant and landlord, and tenant or defendant, an agreement being come to before negotiation as to the name of the third party or umpire, whose decision shall be final. They are matters of little interest, rarely involving any special principle of law, and really only being a money dispute.

With regard to disputes between architects and clients, I think I need add no more to what I have already said. Compensation cases the procedure is practically the same as in other arbitrations already noticed.

I have, therefore, so far, I think, defined the various methods of procedure, the duties of the umpire and arbitrators, including under the latter head the architects and surveyors employed to advise their respective clients.

We now come to the preparation of awards. The duty of the arbitrator or umpire is to ascertain that he is properly and legally appointed; to receive and take into possession the documents or agreements referring to the appointment; to ascertain generally the nature of the claim and counterclaim, if any, so as to avoid what I may call fishing claims, and to regulate the order in which the case shall be heard. The arbitrator or umpire may be appointed in various ways: he may be appointed by a judge of one of the High Courts; he may be appointed by agreement or by some person to whom his nomination has been referred, such as the President of the Royal Institute of British Architects or of the Surveyors' Institution; he may be the person specially nominated in a building contract as the arbitrator. The preliminary points being settled, he must proceed with the hearing, first arranging as to whether witnesses are to be sworn, and must show great patience in allowing all matters to be brought forward, and, at the same time, firmness in stopping irrelevant matter and personal recrimination. He sometimes may, in questions of light and air particularly, be able to make a suggestion which practically puts an end to the case, and it is his duty, whenever he can do so, to shorten the proceedings by means of proposing a fair compromise. He should avoid interfering in the conduct of the case, leaving each party to conduct his own case, and only speaking when it is necessary to give a decision on a point of procedure or to settle or define a doubtful answer. He should particularly avoid showing any leaning to either side, and should allow no expression of opinion as to the merits of the case to escape him. In some cases it may be necessary for him to give an interim decision, or to state a case for the opinion of a superior court prior to proceeding further. For instance, he may have to decide in a disputed account whether or no there is a contract; but this should not be done unless absolutely necessary. At the conclusion of the hearing, having given both sides a fair and impartial opportunity of bringing forward evidence and statements, he should reserve his decision, in order to reflect through the evidence and his own notes. These he should make himself, shortly, both of the arguments of either side as well as of the heads of the evidence. If shorthand notes are taken throughout the whole of the proceedings, his own short notes, embodying only the salient points, are much easier of reference than a verbatim report. It is always well to agree, with regard to shorthand notes, whom they shall be paid for in the first instance, and that they shall be accepted as correct by both parties. It is perfectly useless to have two shorthand writers, one on either side. Generally speaking, it is convenient to have shorthand notes taken of the whole case, without necessarily having them transcribed in their entirety. It saves a great deal of time to have the speeches of counsel and arguments transcribed, as it is impossible for the arbitrator or umpire to follow these exactly with his notes without causing great delay. The heads of evidence he must himself be able to take down. In purely technical cases, such as dangerous structures, party or party fence walls, arbitrators or umpires should be capable of drawing their own awards. In fact, the Act would seem to preclude the employment of solicitors or counsel in these cases. The award should always begin with a recapitulation of the origin of the dispute; under what circumstances it has arisen, whether under contract or otherwise. This part, generally called the preamble, should be accurate and should enumerate the whole matter concisely. The award itself should be drawn carefully in as few words as possible, setting forth the items in dispute in separate paragraphs, one paragraph to each item rather than a connected sentence, stringing them all together, and is sometimes necessary to attach and refer to diagrams, plans, &c. In it the arbitrator must recollect that he is both judge and jury, and, in fact, he has more power than a jury. A jury's decision can be upset on the ground of misdirection by the judge who sums up. An arbitrator has no one to sum up to him, and his decision on the facts is absolutely final, except as I have mentioned in party-wall cases. In most cases except those above named, it is advisable to employ a solicitor to draw the award, furnishing him, of course, with all doc-

necessary to draw the preamble, but not with more than ads of the decision at which you have arrived. If a legal is strongly contested during the hearing, it is better to it once that if such point is insisted upon you will make ward subject to a special case to be stated to one of the or courts. An arbitrator must also remember that he is together in the position of a judge. He has to decide on and not on law, and for that reason it is unadvisable and al that he should in any way give any hint of the reasons have induced him to come to his decision. I have heard that this is cowardly, and that a man should be prepared e his reasons for anything that he does, but I cannot see his accusation is correct. The arbitrator has to do his according to his conscience, and the very essence of his yment is to put a final end to the dispute. His simple on on a point of fact is an end of this, whereas if he gave is he might leave the matter open to continued and pro- further litigation. Where a case is stated for the opinion e superior court it is necessary to give alternative deci- -that is, if the court rule one way, then the decision will and so, the alternative decision being given in case the rules the other way

to costs of arbitrations, these generally follow the decision, many cases both parties may be equally in the wrong, may be necessary to give some decision as to how costs be allotted. Both parties cannot be equally in the right e last word on awards. In making an award do not e or attempt a compromise. As far as possible give your one way or the other. Nothing is so unsatisfactory th parties as striking a balance, or "splitting the nce"

re must also be taken to issue the award within the is prescribed by the Arbitration Act. But the umpire or ator has power to enlarge the time for this, provided es so in writing prior to the expiry of the prescribed l

ow, having spoken of arbitrations, I should like, with permission, to speak on the question of their avoidance ilding contracts, for instance, the necessity for arbitration arises out of carelessness, either in the preparation of ngs, specifications and sometimes of quantities, or out of ant of proper notes made during the carrying out of the s. It is only fair to a builder or contractor that at the t of the job he should know fairly well what he has to do. m it will make a great difference in organising his work n ordering his materials; in fact, it may make the ence to him between profit and loss. Builders are human and if they see a loss before them you are not likely to s good work out of them as if they see a profit, and any actor will tell you that he can work cheaper for one archi- than he can for another. In the first place, contract ngs should not be looked upon as pretty pictures r from an artistic point of view. Every line should efinite, and should mean something; every colour d be an indication of material; shading should be ed; the drawings should not be mixed, details being imposed upon small-scale drawings. Everything should et out as far as possible with the view of giving workmen actually employed what amounts to a book hey can read. Drawings and draft specifications should mpleted before being placed in the hands of the quantity yor. Generally the quantities form no part of the con- but it is only fair that the notes made by the quantity yor during the progress of his work should be carefully dered and added to the drawings and to the specification. quantity surveyor should also have ready access to the tect during the process of taking out quantities, in order any point not clear on drawings, &c., can be made so e the work is tendered for. An architect should as far as ble avoid all alteration of his design during the progress e works, and ought to have made up his mind beforehand e wants to have. Alterations are a fruitful source of te, though they often cannot be avoided on account of the yncrasies of clients. The next great cause of dispute s out of the question of giving orders for extras, omissions variations. It is almost impossible on works to give a n order for every variation and instruction required, but lerk of the works or foreman can be instructed to make of these as they occur from day to day to submit them to rchitect on his next visit, and if the architect initials them can be then acknowledged to be orders in writing under rms of the contract. The proper provision of full-sized detail drawings and other details at the earliest stage of orks is of great use to the contractor, and the showing of deration to him in facilitating the setting out of the work e ordering of goods is an inducement to him to do his conscientiously.

f course builders are also often in fault, raising contentions inwarrantable claims. The only remedy for this is steadily use to entrust them with further work.

With one more remark I shall conclude. A constant source

of trouble in contracts is the attempt to please our client by trying to get a larger amount of work or more elaborate work done for him than an architect can properly expect for the amount placed at his disposal.

Mr. A. O. COLLARD, who proposed a vote of thanks to the author for his paper, said that he should have liked Mr Grüning to have made more references to his own personal experiences. That would offer a good opportunity for any of the members present to raise questions, and in that way to obtain an inexpensive opinion. It was a commonly quoted saying that poets were born and not made. This was also held to apply to artists, but it was no less true of the arbitrator. In taking part in an arbitration it was strongly advisable to avoid the introduction of any legal points, for being usually irrelative they only added to the confusion. There were many architects who were deprived of the faculty of clearly explaining themselves to people, although the whole matter was clear in their own brain. This being so, it was evident that the more an architect knocked about the world the greater chance he had of supplying this deficiency, which was the reason of many troubles. Should any architect be anxious to acquire a personal knowledge of arbitration, the best course was to obtain a lady client and then to accept the contract of a litigious builder. But for students there was no reason why they should not get initiated into the mysteries of arbitration in the same manner as young barristers learn the law, by making a study of it on the spot. The attendance at arbitration cases to see how the architects conduct their cases would be time well spent, even if it had to be taken from the drawing-board, admirable as that institution is. For his part he was of opinion that it ought to form a part of the curriculum of the Association.

Mr. H. T. HARE, who seconded the vote of thanks, remarked that Mr. Grüning's paper had especial value owing to the extreme dryness of all works which treated of arbitrations. The vexed questions concerning ancient lights would be much simplified if the angle of 45 degs. could in some way be recognised by all as the status. There had been several attempts made to improve the law of ancient lights, but there was only one real way, and that was by its total abolition. America had no such law, and no one was anxious to propose one. With regard to what the previous speaker had said about arbitrators being born, not made, it was equally true to quote what Ben Jonson had added when someone made the same statement with regard to poets—that that was so, but all the same they required an endless amount of making.

Mr. C. H. BRODIE was of opinion that bills of quantities ought to be part of the contract, as by that arrangement there would be much less disputing. The committee of the Royal Institute of British Architects had drawn up, and would shortly have ready for use, a form of agreement in which the quantities form part of the contract. He said he considered the Tribunal of Appeal was an excellent instance of the way to deal with arbitration cases. In those cases which came into the courts of law there was frequently a surprising amount of ignorance of technicalities shown by those who had to determine the questions at issue. The state of the law which dealt with ancient lights was nothing short of a scandal. With regard to the adoption of the angle of 45 degs., he thought that it must be perpendicular as well as lateral. A book was soon to be published by the Institute dealing with dilapidations, and this he strongly recommended to the members' attention.

Messrs. H. A. SATCHELL, H. LOVEGROVE, H. J. LEANING and G. B. CARVILL also spoke.

Mr. GRÜNING, in returning thanks, disclaimed the possession of any inherent talent for the duties of arbitrator; it was really a question of luck. When beginning his practice he had got involved in several lawsuits, which both gave him an unusual knowledge of the law and also a reputation of being a fighter. He did not believe that any rigid rule as to the adoption of the angle of 45 degs. would be practical; each case must to a certain extent depend on its own circumstances. He expressed great willingness to help by his advice on matters of arbitration whenever any junior members of the profession found themselves confronted with difficulties. The Tribunal of Appeal was as much a court of law as any court in the world.

The Sanitary Conference held at Manchester have adopted the following resolution with regard to "Garden Cities":—"That whereas the housing problem can be solved and the congestion in crowded centres relieved by a concerted movement of manufacturers, co-operators and others to new areas, arrangements being made for securing to the migrating people the whole of the increased value which their presence will give to the sites, and the area being carefully planned so as to make adequate provision for the individual and social needs of the people, especially with a view to securing for all time the combined advantages of town and country life."

## SOME ANCIENT HAMPSHIRE PALACES.\*

FROM the title of this paper more, perhaps, may be expected than can be gathered even from treasured archives or from what remains of these once important manor houses of the See of Winchester.

With the exception of Wolvesey Castle at Winchester, the other buildings are but fragments of what were once important structures in every way, not alone by the prelate-architects who were associated with their construction, but from the long annals of our land with which they have been closely entwined.

Such examples have been fully represented in Hampshire, and especially in Winchester, whose early history has been bound up with the whole story of the growth of England. Synods and Councils were held at Winchester, and the name of King Alfred the Great, whose brilliant reign has been lately commemorated by a statue designed by Mr Thornycroft and placed in that city, is enough, besides other events, to have made the fame of this southern capital.

Even St. Swithin, to whom the cathedral is dedicated, plays an important rôle in our history, for King Ethelwulf's Charter (the original of which is in the British Museum) gave special grants to the Convent of St. Swithin.

This bishop is said to have induced the monks to build a wall of defence round the cathedral precincts, and it is probable this wall saved the monastery when the Danes were ravaging the city.

It is also said that the outer wall of Wolvesey Castle, which still remains, and shows traces of long and short masonry, flintwork and Roman bricks built therein, is due to St Swithin.

Hence we see the early architectural importance of Winchester. Learning was also represented, and, in the words of Dean Kitchin,† we read:—"Under Alfred's fostering care Winchester became the home of all the learning and the arts known in that day, and rivalled the earlier splendour of the court of Charles the Great at Aix-la-Chapelle. In Wolvesey Castle itself King Alfred compiled the 'Saxon Chronicle,' truly the first history book of the English people."

The artistic activity of Winchester was also seen in the foundation of Hyde Abbey, near the city, where some of the choicest examples of illuminated MSS. were produced, and have come down to our times, preserved at the British Museum and elsewhere. Later on we find this Mediæval city the focus of trade and industry—clear streams supplied resources for the fulling and tanning mills, the cloth manufacture had been well established, and the guild halls of the merchants were a great feature of its life.

As a centre of exchange and trade it rivalled London—so long as Southampton was an important port, Winchester shared in its commerce. In the well-known "Winton Domesday" is recorded the names of the chief citizens, the franchise and liberties this powerful city then enjoyed. It was also a Royal residence, exhibiting true loyalty till the dark days of the Commonwealth, when the city suffered greatly. An attempt was made by Charles II. to revive the ancient glories of the place, for he determined to build there a palace which should rival the splendour of Versailles, and commissioned Sir Christopher Wren to secure a site which would have commanded a stately approach to the cathedral—fair terraces and steps were to lead thither—and a very royal structure would have risen had not the king's death in 1685 arrested the whole design.

Queen Anne was much struck with its situation; the house was never inhabited and was afterwards used as barracks till a great part was lately destroyed by fire. It will thus be seen that Winchester and Hampshire have played a great part in architectural history, and when we consider its prelate-builders, whose names have become household words, a review of their lives and works cannot but form a chapter in our studies. From the first Norman bishop, Walkelin, in 1079, who rebuilt the cathedral, Bishop Henry of Blois, to whom the castles of Farnham, Wolvesey, Merton and others owe their origin, to the famous William of Wykeham, followed by Bishop Wayneflete, and after the Commonwealth period by Morley, the restorer of Wolvesey and Farnham, a series of illustrious craftsmen is presented to our notice.

Their influence also reached to the small village churches, many of which show marks of a high order of merit. A similar influence may be traced in other English counties, especially that of Durham, where Bishop Flambard's hand is not only seen in the glorious cathedral, but in many of the humbler structures, ecclesiastical and domestic, throughout that county.

Of Winchester, writes Dean Kitchin:—"Her ancient buildings, her many customs, gave to the venerable city a right to the undying affection of all those whose lot has fallen to them in such places."

\* A paper read by Mr. S. W. Kershaw, M.A., at the meeting of the Society of Architects held at St. James's Hall, Piccadilly, W., on Thursday, April 24.

† *Historic Towns: Winchester.* 1890.

In offering these outlines of architecture and history to a technical audience I have, in view of the scanty remains of old palaces, ventured to touch more prominently on the names of those prelate-architects who made not only their residence famous, but have added many a page to our country's annals.

In nearly every county there have been palaces and manors belonging to the bishop's see of much historical importance which have played their part in antiquarian annals. Progress and sojourns of some days were made to these houses; they served as a convenient halting-place when journeys were long and tedious, and were also used for the transaction of official business. In the registers and Act books of the various legal and other matters were recorded, with consecration, institutions to livings, several of which were dated from episcopal houses. In Kent these houses were very numerous in olden times, and among the most important were Saltw, Canterbury, Knole, Mayheld (Sussex), Maidstone, and other smaller residences. Their number in this county may be ascribed to the importance of the arch-diocese, which, besides chronicling its own business, included that of other dioceses. In Hampshire the houses are fewer, but no less interesting, and among them were Wolvesey, Bishop's Waltham, Merton, Downton, Highclere, and some of lesser note.

When William of Wykeham was bishop there were twelve different castles, manor houses and places of residence in this country. Of these Wolvesey claims the first rank; tradition goes back to the seventh century and would assign place for a bishop's house on the site of the present structure. From Dean Kitchin's words we gain a glimpse of Wolvesey's early history:—"Under Alfred's fostering care Winchester became the home of the learning and arts in those days. At Wolvesey Castle, with the help of the brethren of St. Swithin's Convent, the earlier part of the Anglo-Saxon Chronicle was compiled and copied—the original MS. has been kept here, fastened by a chain to a desk, that all who wish to read it might read it as it grew from year to year."

Kings and prelates seem to have shared at that time this castle home—in the twelfth century we may fix the foundation of Wolvesey as the "palace" with "a very strong tower," built by Henry de Blois, the architect-bishop who erected portions of Farnham Castle. Bishops and nobles were encouraged by the Norman sovereigns to erect castles in every part of the realm as a stronghold against English rule.

The insecurity of feudal times made every house, no less than the city than in the open country, a castle. Leland describes Wolvesey "a castle or palace well fortified, and the old wall extended almost to the city bridge, being fortified with towers at proper distances," a statement endorsed by Camden, who wrote, "It was very spacious and surrounded with many towers." An interesting feature of Wolvesey was the peculiarity of the masonry of the walls, that were said to have been in connection with a fort on the original structure. Bishop Henry de Blois strengthened this castle, which was again fortified by the Royalists when Winchester and the neighbourhood fell under the contending armies of the Commonwealth.

The city has ever been famed from King Alfred's days to the present; "no English city," writes Dean Kitchin, "has a better record in the past, and a life more peaceful in our rushing age."

Roman roads converged at Winchester, travellers and pilgrims were entertained at St. Swithin's Priory, and foreigners would come from Bordeaux or Havre, after landing at Southampton, to this ancient capital. The city also has a mint from early times, even in King Athelstan's days; in 1105 the mint was destroyed by a fire which burnt the Royal palace and part of the town; the coinage was, however, re-established in another building.

The learning of Alfred and the foundation of Hyde Abbey—so famous for its "Scriptorium"—made the municipal life and guilds of this place very little behind London in those early times, and the Liber de Winton alone, collected by King Alfred, if not his other labours, would have made the city renowned.

To this day the ruins of old Wolvesey remain, picturesque and historic in their decay, while its golden period can recall many a famous incident. At one time it was occupied by Bishop Peter des Roches, a native of Poitiers, and we can almost mind his entertainment of the young King Henry III. here. It was also used as a State prison, as shown by reference to the almoner's roll of St. Swithin's, in which list expenses for the maintenance of prisoners (at Wolvesey) finds a place. Edward III., Queen Philippa and Archbishop Stratford, who had formerly been Bishop of Winchester (1322-33), visited and stayed at Wolvesey. For hospitality and gifts to the attendants and others a heavy charge was incurred, as stated in the receiver's accounts for St. Swithin's Priory. One famous name, William of Wykeham, is prominent as having resided at Wolvesey, and from having lived there in much splendour. Called from his native place, Wickham, near Fareham, in the Hants, he was pre-eminently an architect-prelate, having built Queenborough Castle in the Isle of Sheppey, and Winchester

lege, while his work at Winchester Cathedral and other places would alone signalise his skill.

William of Wykeham was placed at Winchester School; it is not appear, however, that his architectural knowledge developed before his twenty-third year, when he was in King Edward III.'s service and made clerk of all the royal manors, the patent for that office was conferred on him in May 6, followed by the surveyorship of the king's works at Windsor.

Many royal buildings were now rebuilt or restored, the ability followed the example, and it is possible the genius of William of Wykeham exercised a wide influence over the arts of architecture.

Wykeham rose more and more in favour. "Everything," says Froissart, "was done by him, and nothing was done without him."

In 1368 he was enthroned Bishop of Winchester, and as he speedily issued orders to have all the castles, manor houses and palaces belonging to the see repaired. The hospital of St. Cross, near Winchester (so famous in name), was restored by this prelate according to the intention of its founder, Bishop Henry of Blois, Wykeham himself also adding further endowment for the maintenance of thirty-five brethren and three sisters. His great work, the founding of New College, Oxford, was accomplished on March 5, 1380, and the building was finished in six years.

That Winchester might be connected in learning with Oxford this princely prelate founded that famous college in his cathedral city.

"It is natural," says his biographer Lowth, "that he should have a prejudice for the very place which he frequented in his early days; the school which Wykeham went to when a boy and where his college now stands," and it took six years in building.

This great bishop, having seen the completion of his cathedral, began in his seventieth year the greatest of his works—Winchester Cathedral.

He rebuilt the nave, and engrafted the elegant Gothic on his earlier work, still retaining the strength and outline of the old masonry.

"There is no fabric of its kind," says Lowth, "after those of York and Lincoln, which excels the nave and aisles of Winchester Cathedral in greatness and majesty."

Who has not seen with delight the monumental chantries of Esher, Beaufort, Waynflete and Wykeham, in which the perfected styles of art make so prominent and fascinating a picture? Wykeham was one of a band of architects whose genius has adorned our land, and may be cited as an example of one who conquered the difficulties of adapting new ideas to the spirit of the old work.

The picture gallery at Farnham Castle has a fine portrait of this prelate, who will ever be linked with the annals of art and architecture.

Wykeham was nearly succeeded by William Waynflete who was educated at Winchester and Oxford, and founded Magdalen College in that city. In 1438 he was made master of St. Mary Magdalene Hospital, in Winchester, and Henry VI afterwards made him master of Eton, a school which in some respects was modelled after Wykeham's College at Winchester.

Much intercourse took place between the college authorities and Waynflete as to architectural matters, the former visiting the bishop four times a year, accompanied by the chief mason, carpenter, and Walter the carver. "The bishop to supply materials, pay for all labourers, and to provide lodging for said Walter and all his servants."

In 1479 we read that Waynflete contracted for a supply of stone from the quarry at Headington, near Oxford, to be used in building his own college (Magdalen) and Eton.

The roll of accounts mentions several journeys to Winchester. In the year 1482 we read that the lead of the roof was put in by contract between the bishop and one John Woodhouse, of Wynefeld (Wingfield), in Derbyshire. Though Waynflete's share in the Eton buildings was great, Professor Ellis remarks that his work was confined to the church, from the numerous "entries in the accounts connecting his name with work there."\*

Waynflete resumed his work at Eton after the death of Henry VI., and on learning the small amount available for building, "not only took upon himself the direction of the works, but even supplied the necessary funds—an act of singular generosity on his part, as he was at that time engaged in his own foundation at Oxford. We also learn that the shop of Winchester's glazier came three times to Eton in the course of the year to measure the windows of the new church, and the east window is specially mentioned."

Again, in the "Architectural History of Cambridge" (vol. i. 401) is a transcript of the specifications drawn up for the

Eton buildings, and in one item Bishop Waynflete appears as a contributor to the work:—

Item of the Bushop of Wynchester for the wages of X freemasons . . . . . £LXXV XVs.

He lived to see the restoration of the Red Rose in the person of Henry VII., and died in 1486, the last of the illustrious trio, Wykeham, Beaufort, and himself. At Esher are the remains of Wolsey's tower (or gatehouse) of the palace built for that cardinal by Bishop Waynflete—"the stately mansion of brick"—between the years 1450-80, a building which in Wolsey's time must have recalled a small portion of Hampton Court. Naught but the picturesque tower overlooking the river Mole remains to tell of what once was the historic home of prelate and cardinal alike. The original building was mostly of brick, and a winding staircase of that date still exists, said by some to have been in part a faint imitation of the famous staircase in the château at Blois.

It is not unlikely that the influence of foreign workmen and artists who were employed by Henry VIII. at Hampton Court, Nonsuch Palace and Whitehall, may have led to the introduction of some details in Esher Place which could be traced to Italy or France.

In the eighteenth century great changes were made to Esher Place by Kent, the architect of the Horse Guards, in remodelling, insertion of windows, &c., and this took place during the tenure of Henry Pelham, the statesman; after his death the house was pulled down.

Esher Place has lasting memories; here Wolsey took farewell of his chaplains and the Court in the great chamber, addressing to them the pathetic words immortalised by Shakespeare, and if by a dramatic license the Cardinal's grand speech to Cromwell could be given here rather than at York Place, it would recall the well-known lines:—

Oh Cromwell, Cromwell,  
Had I but served my God with half the zeal  
I served my King—He would not in mine age  
Have left me naked to mine enemies.

Another prelate, Bishop Fox, lived much at Wolvesey, and is commemorated by his exquisite chantry tomb in Winchester nave, as well as by the erection of the famous altar screen in St. Saviour's, Southwark, near the once standing Winchester House, the London home of the bishop of that see. Bishop Fox's screen at St. Saviour's is well known for its elaborate work, and affords an interesting contrast to that at Winchester, also designed by this prelate.

The Southwark screen has thirty-three niches, perhaps in allusion to our Saviour's earthly life of thirty-three years, and Bishop Fox's peculiar device, the pelican feeding its young, is seen in many places. The screen is divided horizontally, like the Winchester example, into three stages, and contains some grotesques and other designs of originality and power. Bishop Fox, who often lived at Winchester House (his London home), would frequently have come into his church of St. Marie Overie and inspected the progress of this exquisite screen.

In Winchester, besides the screen, is Fox's glorious chantry, so famous for its details and enrichments with every form of ornamental art and some heraldic work. In the recess behind the altar in this chantry he spent many hours, and it came to be called Fox's study; "thither he was often led after his blindness."

The roof of the present choir of Winchester is attributed to this prelate, and decorated by him about the year 1502. He lived most at his manor of Esher, also at Farnham Castle, Bishop's Waltham and Taunton, all of which houses were attached to the see of Winchester. It is probable that Bishop Fox had no other architect than the freemasons—the master of the works, the designs would have been his, the details and plans the workmen's.

As one of the executors of Henry VII. and Lady Margaret, he had much to do with the building of St. John's College, Cambridge, also King's College, in that university. The designs of the stained glass in King's College Chapel are attributed to Bishop Fox, by the direction of Henry VIII., in 1515. The "Architectural History of the University of Cambridge" corroborates this fact, as appears in a memorandum of payment of 100*l.* to Barnard Flower, the King's glazier, November 30, 1515:—

"This bill witnesseth that Mr. Thomas Larke, prest, surveyor of the King's workes in Cambridge, have receaved of Mr. Robert Hacumblen, Provost of the King's College there, one hundred pounds sterling, to be delivered unto Barnard Flower, the King's glazier, in way of prest towards the glazing of the great Church there in such form and condition as my Lord of Winchester shal devise and comande to be doon." By some, the matchless windows in this chapel have been attributed, without evidence, to Albert Dürer.

Bishop Fox was frequently associated with Wolsey in architectural projects, and when the latter was enlarging Hampton Court, Fox's manor house of Esher was at the dis-

\* *Architectural History of University of Cambridge*. Willis and Clark, 1886.

posal of the cardinal, for the bishop wrote to him, "Would God that the poor lodging at Esher did content your Grace as much as it rejoices me that it can please you to use it, as often and as long as it shall please you, right as your own, and make it a cell to Hampton Court."

In 1523 Wolsey induced him to resign his bishopric on account of his blindness, which Fox declined to do, saying that although he could not distinguish black from white, yet he could discern between true and false, right and wrong, and saw the malice of the cardinal which he did not see before, and it behoved him not to be so blinded with ambition as not to foresee his end.

During Gardiner's episcopate, Wolvesey was the scene of much splendour. Queen Mary and Philip held their marriage feast in the hall of the palace, and Latin orations were pronounced by the Winchester scholars. The Civil Wars raged fiercely in Hampshire; the old palace of Wolvesey was destroyed, or naught left but a few walls; the ancient castle near the entrance to the city was also dismantled in that dire siege which devastated the country all around Winchester.

With the Restoration a new era dawned on Wolvesey; Bishop Morley was then the prelate of St. Swithin's see. He began rebuilding the structure, and employed Sir Christopher Wren for that purpose, who was also designing a new palace for Charles II. in another part of Winchester, a design never completed, and meant in its splendour to rival Versailles. Bishop Morley is also known as having repaired Farnham Castle, and he rebuilt the present chapel of that historic pile. The last to improve Wolvesey was Bishop Trelawney (1707-21), who added one of the wings and made many internal alterations.

Trelawney's name will long live in the West Country, famous as one of the Seven Bishops, and associated with the old Cornish song—

And shall Trelawney die?  
Then twenty thousand Cornishmen shall know the reason why.

In the middle of the eighteenth century Wolvesey was abandoned for Farnham and London as episcopal residences of Bishop Brownlow North; it is stated that he actually ordered the destruction of some part of Morley's work, a proceeding that would to-day receive severe and merited protest.

For some years since that date Wolvesey was left almost an empty house; it was, however, readapted by the late Bishop Harold Browne of Winchester as a Church-house, and thus remains to tell the story of its more interesting and earlier days.

#### *Bishop's Waltham.*

Of this palace, Leland wrote:—"Here the Bishop of Winchester has a right ample and goodly manor house, moated about, and a pretty brook running hard by it." The country around was well suited to such a house; the vast hunting-ground of Waltham Chase was near, and a park of 1,000 acres surrounded the domain. The name Weald-ham or Woldham would suggest the ancient wooded nature of the district, and Bush Waltham has sometimes been mentioned as a probable appellation. The palace was built by Henry de Blois; succeeding prelates added to or improved the house, especially William of Wykeham. To this day the great hall can be traced, its five large windows shrouded in ivy, together with a ruined tower adjoining.

The water or lake around may have served, as of old, for the fish ponds, an important item in those days, when Church fasts were strictly observed.

In the Domesday Survey of 1086, we find that Waltham had always belonged to the bishopric, and that Bishop Wakelin possessed it.

Bishop Henry of Blois was building the palace in 1138, at the time when he was erecting other manor houses of the see, also the famous hospital of St. Cross. A great deal of Bishop Blois's work has perished, but some of the windows on the western side seem to be of his time, also other portions lately uncovered and preserved by the care of Sir William Jenner, a recent owner of the property.

William of Wykeham, who was born in the neighbourhood, loved this palace and much improved it. He resigned his office as Chancellor in 1391, and came to reside at Waltham. The building did not escape the Civil War period; in March 1644 preparations for an assault were made, terms of surrender were agreed on, but in a few months afterwards the palace was almost a ruin.

Bishop's Waltham Church, in the neighbourhood, claims a word as having had in some part of its design the work of Bishop Blois and of William of Wykeham in the chancel, the east window of which has his well-known badge of the rose, seen also in the church at Meonstoke in this county. Besides the architectural skill of William of Wykeham he showed genius in construction of roads over marshy grounds or difficult approaches. The route between London and Winchester was very bad, and was mended and repaired at this prelate's instance. It is said by his biographer, Dr. Lowth,

that to supply himself with the best stone he purchased the use of the Quarr Abbey quarries in the Isle of Wight, and wrote letters to all the clergy of the island to send in as many workmen as they could supply. His position as warden and justiciary of the king's forests seems somewhat appropriate when we know that all round Waltham were vast wooded tracts. Woolmer and Bere forests may have formed part of that great "Anderida" or Andred's Wood which stretched along southern England.

Waltham Chase was well stocked with deer until the last century; it is not surprising, then, that we read of royalty past times favouring this spot. Henry VIII. hunted here, and bishops were known to follow this sport. When Dr. Morley was bishop he divided up Waltham Chase into farms which he leased, and in this way cleverly enriched the episcopal coffers. Bishop Hoadley some years later was urged to restore the ground; he said he had "done mischief enough already." At that time gangs of deer stealers called "Waltham Blacks" had destroyed a great part of the herds, and an Act called the "Black Act" had to be passed against these marauders. Near Liphook there was the so-called "Queen's Bank," from tradition that when Queen Anne was journeying on the Portsmouth Road she saw the whole herd of red deer brought before her by the keepers.

After Tudor times, Waltham became disconnected with the bishops of Winchester. Bishop Andrews (1618-27) seems to have been the last inhabitant of the picturesque house. Dr. Andrews's fame as a preacher and scholar is wide. He was a member of a society of antiquaries which numbered such men as Lord Burleigh, Sir Philip Sidney and others, under the patronage of Archbishop Parker, that "mighty collector of books." One of the objects of this society was the preservation of MSS. dispersed at the dissolution of the monasteries, and steps were taken to have copies or transcripts made of such as could be found. In 1644 Sir William Waller was at Winchester and Basing House, and Bishop's Waltham fell prey to the invading army, and the manor was sold. The Civil War had raged all along the border from Farnham to Winchester, and near that city, at Cheriton, a great battle was fought. The havoc inflicted on many an old building was so great that the remark was current, "no event had wrought so great a change in rural England."

Grose, the antiquary, visited Bishop's Waltham some hundred years ago, and then mentions "two courts, a gate hall, a chapel with cloisters, aisles, &c." Fragments of some of these are still remaining, and help us to imagine what was called in Gough's letters "the fair old house in times past or, as Camden wrote, "the stately seat of the bishops of Winchester."

#### *Merdon.*

Merdon, in Hursley parish, four miles south-west of Winchester, was an occasional residence of the bishops of Winchester, built and fortified by Henry of Blois *circa* 1130; all that is now left is a deep well and some ruins now in Hursley Park. Merdon is not mentioned in Domesday, and in early times was possessed by others than the bishops of Winchester; for a time the manor was held by Sternhold, who had been groom of the chambers to Henry VIII., and better known for his version of Sternhold and Hopkins's psalms.

Merdon may mean the hill fort by the pond or marsh, and it is not unlikely when the country was much wooded that it was a pond or marsh in the hollow. The house was built for defence rather than domestic use, and the manor was distinguished for special customs under which the tenants held their lands. In 1266 we read in a compertus of Bishop Guernsey (Winton) an entry for repairing and furnishing the hall. A fragment only of a flint tower remains of the whole structure; the castle was in ruins in the fifteenth century. The castle was built on an island of chalk down, shut in by trees. The fragment still standing is believed to be part of the northern gateway tower, and the entrance would have been by a drawbridge. An embankment seems to have been thrown up outside the first moat, with an outer moat of its own. The embankments on the south and west commanded a great extent of country, and on the north are steep earthworks, now overgrown with trees. The bishops of Winchester lived at Merdon from time to time, though it gradually fell into decay and was ruinous at the end of the Plantagenet period.

The Lords of Merdon were originally patrons of the church of Hursley; the manor was surrendered to the Crown by Bishop Poyntet, temp. Edward VI., and towards the middle of the eighteenth century became the property of Richard Cromwell, son of the Protector.

The old house was afterwards pulled down, and it is said that one of the walls was found the seal of the Commonwealth.

#### *Highclere.*

Another manor was Highclere, alienated from the see of Winchester in 1551 by Bishop Poyntet, who gave this and other manors to the Protector's brother, Henry Somerset. The

hops of Winchester sometimes lived at Highclere, but they also a house at Bishop's Sutton, near Ropley. Not far off the ancient town of Old Alresford, which was in a way associated with the prelates of Winchester, for Bishop Lucy (1093-1204) formed here a reservoir which communicated with the Itchen river, and thus established water transit between Winchester and Southampton. The town is also said to have been re-established by the same bishop after it had greatly fallen into decay. In glancing at the work of some of the architect-prelates of the see of Winchester, one is compelled to see that their erection and oversight of several manor houses formed no small part of the annals of old English architecture, as well as contributed to the architectural wealth of the diocese.

The surface of our country is studded with historical records, written in stone and brick and earthworks, which reach over the ages before the dawn of written history, and carry them without a break into the living present.

In connection with my subject I may mention the churches of East and West Meon, well known to most architects for their Norman work, but especially associated with this paper as East Meon was one of the bishop's manor houses, and the remains (now a farmhouse) may be seen opposite the church gate.

The brick walls and arches of this once former palace are still standing. Wakelin, the first Norman bishop of Winchester, made it his residence, and the tower of the church is attributed to him.

Farnham Castle, though on the Hampshire border, may easily be included in the list of ancient palaces, especially as the seat of the see and diocese of Winchester, and can therefore form an appropriate close to this paper.

The manor belonged to the bishops of Winchester since 1060. Of the original fortress, built in 1136 by Henry de Blois, bishop of Winchester, little remains save the keep and the servants' hall with its circular pillars, formerly the castle chapel.

The keep, the oldest part, with heavy buttresses, is surrounded by a broad, dry moat.

The castle has seen many changes, at one time almost buried to the ground and again devastated in the Civil War by William Waller. The war cloud broke heavily over Surrey and Hants. Farnham, the border fortress, was most important. Sir John Denham was then its governor, and obtained for the Parliament, and during the siege, George Withers, poet, was in charge of the castle.

We need but recall the siege of Basing House, not so far distant, to learn what havoc war was making in this district. This famous fortress stood a siege of four years, and but a few fragments of the old house remain, as the gateway, ivy covered walls and terraces overgrown with brushwood.

After the Restoration, Farnham Castle entered on its new life, repaired and improved by Bishop Morley, who died the see of Winchester from 1662-84. Morley was the friend of Isaac Walton, the "gentle angler," and at Farnham had his own rooms, and here it is said he wrote the lives of Herbert and Donne. The Bishop had largely given to the air of Winchester Cathedral and to his palace at Wolvesey. He laid out 8,000*l.* on Farnham, and had annexed Winchester House, Chelsea, to the diocese as the town residence for the bishops. These and other handsome gifts evoked the remark of Charles II., that Bishop "Morley would never be a penny richer for his bishopric." The present private chapel erected by this prelate has some interesting features. The wealth of carving by Grinling Gibbons cannot escape notice. Other departments in the castle are the great hall, with portraits of the bishops of Winchester from early times; the panelled galleries also full of historic treasures and paintings.

The castle in old times had its various officers, as constables, keepers of the park, &c.; one of them in the reign of Queen Elizabeth was William More, of Loseley, whose charming Tudor mansion near Guildford has formed the subject of many an architectural sketch and pilgrimage. No more picturesque seat exists in Surrey. The custom of each castle having had its constable in the Middle Ages rendered the office of great importance, and that of Farnham was no exception to the rule, the office being continued so late as 1808, in the time of Bishop North.

Farnham Castle, on the lofty hill, looks down on the busy town below; the entrance-front is of brick and stone; picturesquely placed are many trees and some giant cedars which overshadow the sloping lawns. The entrance-porch of red brick was built by Bishop Fox, and is known as Fox's Tower, battled with octagonal turrets. Over the entrance of this tower is a sundial with the motto, "Imputantur prætereunt."

We have before noticed Bishop Fox's architectural enterprises at Winchester, Eton and elsewhere, and this prelate spent the latter years of his life at Farnham. Queen Elizabeth visited the castle several times in her "Progresses," and James I. made so many visits here that Bishop Bilson ventured to ask His Majesty "if he looked on Farnham as an inn?"

In a paper on the "Historical Associations of Farnham" (*Surrey Archaeological Journal*, vol. viii), Mr. St. John Brodrick truly said "that the interest which attaches to the castle as a relic of antiquity is doubled by the way in which the distinctive features in its history at different periods illustrate the general history of England."

We may also add to these impressive words as to this and like houses, so distinctive a feature of our land, the words of a living writer:—"We may erect new palaces; we cannot hang their walls with the pictured tapestry of history, nor clothe them with the evergreen ivy of national memories."

## BRISTOL SOCIETY OF ARCHITECTS.

THE annual general meeting of this Society was held recently at the Fine Arts Academy, Queen's Road, Clifton, Mr. Frank W. Wills (president) in the chair. After the confirmation of the minutes of the last annual general meeting, the scrutineers appointed for the election of officers and Council reported that the result of the voting was as follows:—President, Mr. Joseph Wood; vice-presidents, Messrs. G. H. Oatley and F. W. Wills; council, Messrs. W. L. Bernard, F. Bligh Bond, J. H. La Trobe, Thomas Nicholson, W. S. Skinner and J. Foster Wood; hon. secretary and treasurer, Mr. H. Dare Bryan; associate members of council, Messrs. M. A. Green and T. H. Weston.

The annual report of the Council was then read by the Hon. Secretary and the audited accounts presented, and upon the motion of the President were adopted.

A highly interesting lecture devoted to architectural research was delivered by Mr. J. Atwood Slater, first silver medallist and premium holder in design in the Royal Academy of Arts, London, and Sharpe prizeman of the Royal Institute of British Architects, London, describing an architectural tour undertaken in 1880, and detailing picturesquely the architecture and incidents of personal concern dependent on travel met with in the departments of Seine-Inférieure, Seine and Oise, and Seine, penetrating into the heart of France as far as Auxerre. The course of the Seine, with its diverse monuments, was topographically followed from Harfleur to Paris, and subsequently in its considerable ramification the stately river Yonne, Melun, Fontainebleau, Sens, and finally the rich town of Auxerre coming under consideration. The lecturer also drew special attention to the advantage derived from travelling alone for the purpose of observing better the archaeological wealth and the customs of the French, having a distinct and definite line of study and object lesson ever in view; to his wide sympathy with the French people, to their sumptuous care for their ancient monuments, their courtesy and reverential manner of hospitality towards English-speaking students; and also in particular to the unsuspicious, deferential manner in which they are entertained and regarded by the Ministerial authorities, detailing in precise biographical manner his experience with bourgeoisie and with peasant, ecclesiastic and soldier. He recorded minutely also the incidents and popular events associated with travel, as study and the tide of time goaded him onward, the wave of diurnal events lying upon the open page of history, here dishevelled, here streaked with adverse episode, and there becalmed. The hour being late, a hearty vote of thanks was accorded the lecturer, and the hearing of the conclusion of a most interesting tour was adjourned to another meeting.

Mr. Joseph Wood, the new president, then thanked the members for his election, and proposed a hearty vote of thanks to the retiring president (Mr. Frank Wills). This was seconded by Mr. G. H. Oatley and supported by the Hon. Secretary. The retiring President acknowledged the vote, and referred in complimentary terms to the assistance he had received from Mr. H. Dare Bryan, the hon. secretary, who had consented to serve in that capacity for another year. The proceedings then terminated.

## THE TRAINING OF ARCHITECTS.

THE following letter has appeared in some daily journals:—The Architectural Association of London has for fifty-four years devoted its energies to the education of architects, and it is now the principal architectural teaching body in the United Kingdom. The present membership is over 1,400, including many of the leading architects of the day.

For forty years instruction in its classes was given voluntarily by its members, but the work during that period had so increased that in the year 1891 reorganisation became necessary, and the school was remodelled under a salaried staff. Its curriculum now embraces all branches of study essential to architectural practice. Last session 230 individual students attended the various classes and studios.

The subjects treated in the Evening School of Design are set and voluntarily criticised by well-known London architects, while the advisory council of the day school includes almost all the architect members of the three Royal Academies of the United Kingdom. This educational work has quite outgrown the premises in which it is being carried on, and the future welfare of the Association depends upon its obtaining extended accommodation without delay.

About 20,000*l.* is needed to provide the building, including equipment and fittings.

Owing to the greatly increased interest now being taken in these subjects by the general public, the executive committee is encouraged to appeal to all those interested in architecture for contributions to enable them to carry out their project.

No art more tends to mark the progress and greatness of a nation and no science does greater service towards securing the health and comfort of its people. The one great aim of the Architectural Association is that students may have the best possible training both in the art and science of architecture.

The committee will gratefully acknowledge the receipt of any donations to the building fund, which should be forwarded to the Secretary of the Architectural Association at No. 56 Great Marlborough Street, London, W.

We are, Sir, yours faithfully,

W. Howard Seth-Smith, president Architectural Association.

R. S. Balfour and H. P. G. Maule, hon. secretaries.

*The Editor does not hold himself responsible for opinions expressed by the writers.]*

#### St. Mary Magdalene's, Munster Square.

SIR,—“In spite of all advances which have been made in architecture and in ecclesiastical practice during the last fifty years, very little besides the addition of the screen, which the first builders certainly intended that it should have, is needed to make St. Mary Magdalene's Church as much a pattern to others in the twentieth century as it was in the middle of the nineteenth.”

Such is the opinion of Mr. J. T. Micklethwaite, F.S.A., who has submitted an exhaustive report on the whole matter of possible improvements to St. Mary Magdalene's Church. His proposals, shortly, are:—

	Estimated Cost.
Chancel screen, with loft	£1,000
Side screens (each)	800
Altar on south side	50
Returned stalls	70
Better arrangement of steps	100
To these must be added:—	
Cleaning and ventilating	£300
Electric lighting	300
Repair and improvement of organ	650
Outside communication between the two vestries	150

My object in writing this letter is to ascertain whether among your readers any are sufficiently interested in the matter to help us to carry out any portion of Mr. Micklethwaite's designs. We are not a rich congregation, though many people think we are. But there may be some of your readers who would be glad, for the architectural reputation of St. Mary Magdalene's, to contribute, in commemoration of the jubilee of its consecration, something to further its improvement in the ways suggested.

Mr. Micklethwaite's name is sufficient guarantee that his proposals will be carried out in a manner worthy of the best interests of the church and of the profession. Contribution may be sent to the churchwardens of St. Mary Magdalene's, 58 Osnaburgh Street, N.W.—Yours faithfully,

W. H. H. JERVOIS,  
Vicar of St. Mary Magdalene's, N.W.

#### GENERAL.

**Mr. Sidney Hall** has had the honour of submitting to their Majesties drawings of their Royal Highnesses the Prince and Princess of Wales's Colonial tour.

**The First Commissioner of Works** has stated that the construction of the new road from the Mall to Charing Cross will be carried out as soon as possible after the obtaining of the necessary funds. The houses to be removed to secure the opening into Charing Cross will be in vacant possession of the Department this summer.

**An Exhibition** of books, pictures and prints dealing with past Coronations is to be opened at the British Museum.

**The Académie des Beaux-Arts** have admitted the following students of sculpture to compete for the Prix de Rome:—MM. Terroir, Maillard, Descatoire, Raset, Brasseur, Billot Durand, Benneteau, Piron and Boudier.

**The Corporation of London** will oppose in Parliament the London County Council's Bill for constructing a tramway along the Embankment.

**The Miss Yonge Memorial Committee** have resolved that the memorial at Otterbourne, where Miss C. E. Yonge lived and worked all her days, should be a chancel-screen in the parish church, and that in Winchester Cathedral a new reredos should be erected to her memory in the lady chapel.

**The German Emperor** has given a series of mosaics representing scenes from the life of St. Elizabeth, to be placed in the room which she inhabited in the Wartburg, near Eisenach.

**Mr. Walter Crane** was elected a full member of the Royal Society of Painters in Water-Colours at the general meeting held last Monday.

**Two Studentships**, endowed for the furtherance of advanced study or research away from Cambridge in the language, literature, history, archaeology, or art of ancient Greece or Rome, according to a course proposed by the applicant and approved by the electors, are available. The student will receive 200*l.* for one year.

**The Municipal Council of Berlin** have postponed until the autumn the construction of the “Fairy-stories Fountain” at Friedrichshain. The German Emperor has insisted on considerable alterations in the plan.

**Miss K. L. Long** has been appointed by the Wandsworth Borough Council as a female sanitary inspector at a salary of 100*l.* a year, rising to 130*l.*

**Mr. R. Carr Bosanquet**, director of the British School at Athens, has begun excavations on a promising Mycenaean site at Palaioakastro, near Sitia, in Eastern Crete. Although it was not possible to devote any part of the Cretan Exploration Fund to this object, the sum raised being insufficient even for the completion of Mr. Evans's excavations at Knossos, the two explorers are working in concert, and the house at Candia which was acquired by the managers of the fund (of whom Mr. Bosanquet is one), is also at the service of the school.

**Lord Alverstone**, the Lord Chief Justice, said on Monday that if owners of land in the suburbs, when laying out new building estates, reserved a site for a church, they would find that their property would sell much better.

**The Guards' Memorial**, which is to be placed in the Guards' Chapel at Wellington Barracks in memory of those comrades who lost their lives in the present war, has been approved. The intention is to complete the decoration of the apse of the chapel by additional mosaic embellishment immediately in front of the similar mosaic memorial of the late General Philip Smith in the semi-dome. Further, alabaster columns will be substituted for the existent white stone columns supporting the arch of the apse, and from which droop the old Crimean standards of the Guards, whilst the names of the 700 Guardsmen who have fallen or died during the campaign will be inscribed on marble slabs within the chapel. Mr. Clayton prepared the design under the superintendence of Mr. Pearson, the architect.

**Mr. Henry L. Florence** was on Wednesday appointed Grand Superintendent of Works of Grand Lodge of English Freemasons.

**The Bangor City Council** have presented a free site for the erection of new buildings for University College, North Wales.

**The Plans** prepared by Mr. W. H. Ward for the new Workhouse Infirmary, Stockport, have been adopted. The estimated cost is £41,000, or about £130 per bed.

## Architect and Contract Reporter.

## EDITORIAL NOTICES.

*view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*respondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**CREWE.**—June 12.—Designs are invited for new municipal offices and council chamber. The author of the design which is judged best will receive a premium of 50%, and he will be invited to carry out the design; second premium, 25%. Particulars will be supplied by the Borough Surveyor, Municipal Offices, Crewe.

**HARROGATE.**—May 14.—Designs required for a new town hall. Premiums, 150%, 100%, and 75%. Mr. F. Bagshaw, Borough Engineer, Harrogate.

**HARTSHILL.**—June 16.—The committee of the North Staffordshire infirmary and eye hospital, Hartshill, Stoke-upon-Trent, invite designs for a home for nurses at Hartshill, Stoke-upon-Trent. Particulars may be obtained on application to Mr. E. Boyce, secretary and house governor.

**KNARESBOROUGH.**—June 1.—The Harrogate and Knaresborough Joint Isolation Hospital Committee invite competitive designs for an infectious disease (other than smallpox) hospital

at Thistle Hill, Knaresborough. Premiums of 100% and 50% are offered for the two selected designs. Mr. J. Turner Taylor, clerk, Municipal Offices, Harrogate.

**LIVERPOOL.**—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

**SUNDERLAND.**—Aug. 30.—Designs are invited for proposed police and fire-brigade buildings to be erected in Gill Bridge Avenue and Dun Cow Street. Premiums of 100%, 50%, and 25% are offered for first, second and third designs respectively. Mr. Fras. M. Bowey, town clerk, Town Hall, Sunderland.

Hall, Weston-super-Mare.

WHITBY.—May 22.—For erection of dwelling, for signal-  
house, &c, near Whitby, Yorkshire. Messrs. Corderoy, Selby  
& Corderoy, 21 Queen Anne's Gate, Westminster, S.W.

WOODLAND.—May 10.—For erection of Wesleyan Sunday  
school and temperance hall at Woodland, Durham. Mr. I.  
Tarn, Zetland House, Woodland.

At the St. Helens Town Hall on the 29th ult. Mr. A. A. G.  
Malet, M.I.C.E., and Dr. Buchanan held an inquiry on behalf  
of the Local Government Board into the application of the St.  
Helens Corporation to borrow 18,500*l.* for works of sewage  
disposal. The town clerk explained that the scheme for  
which borrowing powers were sought was for the disposal of  
the sewage of the north-westerly portion of the borough,  
exclusive of Parr and Sutton, which would be the subject of a  
separate scheme.

DUKE OF CONNAUGHT AT WOLVERHAMPTON.

The Duke and Duchess of Connaught visited Wolverhampton yesterday (Thursday) for the purpose of declaring the exhibition open. As a souvenir of the occasion His Royal Highness was presented by Messrs. Chubb & Sons with a key of which we are able to give a presentment.

The key, which is of the finest workmanship, is fashioned in solid gold by hand, and has the shamrock as the base of its design, in reference to His Royal Highness's title, his initial "C," in diamonds, forming the centre of the bow. It was prepared from the design of Mr. Walter Churcher, and is presented by Sir George Hayter Chubb, Bart., chairman of the don committee.

TRADE NOTES.

THE extensions to the Technical schools, Sale, are being warmed and ventilated by means of Shorlands' patent Manchester grates, exhaust roof ventilators and special inlet panels, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

MESSRS. COUSLAND & MACKAY, ventilating engineers, Glasgow and Manchester, have carried out the ventilation of St Mary's Street Boys' school, Kidderminster, by means of Mackay's patent direct-acting turret ventilators and improved quadrant inlets, of which they are the sole makers

MESSRS. ARCHIBALD SMITH & STEVENS, of Queen's Road, Battersea, write to us to the effect that they supplied the two express passenger lifts which have been fitted in the Alliance Insurance Company's handsome new offices in the Strand, an illustration of which appeared in our issue of the 18th ult.

MR. ALBERT HILDESHEIMER, fine art publisher and colour printer, asks us to mention that he has secured new offices and warehouses at 33 and 34 Shoe Lane, E.C., as his old premises—2 New Zealand Avenue, E.C.—were entirely destroyed by the recent great fire in Barbican.

MR. SAM DEARDS'S patent self-locking glazing system has lately been adopted for the following electric power stations and car-sheds, viz :—Oban, Sutton, Broughty Ferry, Ilford, Weston-super-Mare; also for the Walthamstow School Board, new roofing at Fulham Workhouse, extensions at Messrs. Mann, Crossman & Paulin's, Mile End, and Southampton Library.

MESSRS. JAMES PAIN & SONS, 9 St. Mary Axe, manufacturers of the useful smoke cases for drain testing, forward us a lengthy list of testimonials which they have received from surveyors, engineers, sanitary inspectors of corporations, urban and rural district councils, &c., all of which are emphatic in their testimony to the value of this very simple contrivance.

MESSRS. MESSENGER & CO., LTD., horticultural builders, of Loughborough, in a neat little price list which they have just got out, give some capital illustrations, some of them from photos, of work which they have recently carried out. These buildings combine lightness with substantiality in an eminently practical manner, and to judge by the prices given their cost is not by any means an onerous matter. We are reminded in this booklet that Messrs. Messenger are the holders of numerous medals, &c., gained at the various exhibitions.

Clydebank are ventilated and warmed on Key's improved "Plenum" method, whereby the air, after being filtered and warmed in winter, and filtered and cooled in summer, is propelled into the apartments in such volume as will renew the air within them from seven to fourteen times per hour positively, and without draughts. The designing of the scheme, and the whole work of fitting up the apparatus, including steam boilers, steam engines, air propellers, &c., were carried out by Mr. William Key, of London and Glasgow. Mr James Miller, Blythswood Square, Glasgow, was the architect.

MESSRS. THE GRAHTRYX VENTILATING AND ENGINEERING CO., LTD., successors to Baird, Thompson & Co, Ltd., ventilating engineers, and specialists in ventilation, heating, drying, cooling and sanitation, of 23 Sutterton Street, Caledonian Road, inform us that they have recently finished ventilating and warming by low-pressure steam the new free library at Wolverhampton and the new drill hall, Bilston. Amongst other contracts they now have in hand are the ventilation and warming of the new Technical schools for the Southend Corporation and the new Technical school for the Tunbridge Wells Corporation, the heating and hot-water supply of Oak Lodge, Wimbledon, for Mr. A. J. Bolton, and the ventilation and warming of Broadway Court, Evesham, for Mr. A. Ede Navarro.

### VARIETIES.

THE new Wesleyan chapel at Great Hale, near Sleaford, erected at a cost of about 650*l.*, was opened on Sunday last.

THE new Wesley Sunday schools, situate in Church Street, Whitby, were dedicated on Wednesday.

THE sites committee of the London County Council have concluded it is not expedient that a site on the Crescent island to be formed in connection with the Holborn-to-Strand improvement should be reserved for the erection of new offices for the Council.

THE new Roman Catholic church of St. Andrew's, erected at Ravelston Place, Edinburgh, to serve the growing Catholic population in the north-west district of the city, has been opened. The new church is only a temporary edifice. It is built of wood in the old English style, seated with chairs upholstered in tapestry, and affords accommodation for 600 worshippers. The church cost about 850*l.*

THE Abercorn Public school, erected on the Renfrew Road Paisley, at an estimated cost, including furnishings, of 25,000 was formally opened on the 28th ult. It occupies a site of three acres. The main building is two storeys in height, with ceilings 14 feet high. Accommodation is provided for 1,400 scholars, and there are wide fireproof staircases for the boys and girls at their respective entrances.

THE Council of the Institution of Civil Engineers have awarded the following medals and premiums:—A Telford gold medal to Mr. W. M. Mordey, and a George Stephenson gold medal to Mr. B. M. Jenkin, a Watt gold medal to Mr. J. A. Aspinall, and Telford premiums to Messrs. W. C. Coppell, Thwaite, A. H. Haigh, B.Sc., and J. Davis. The Council have also awarded the Howard quinquennial prize of the institution to Mr. R. A. Hadfield, of Sheffield, for his scientific work in investigating methods of treatment and new alloys of steel, and on account of the importance in industry of some of the new products introduced by him.

THE new baths and washhouses which have been erected by the Fulham Borough Council were opened on the 10th ult. The establishment is a fine and commodious one. It has three swimming ponds—a ladies' bath with 31 dressing-boxes, a first-class men's bath with 64 dressing-boxes, and a second-class men's bath with 125 dressing-boxes. In addition there are 28 first-class and 56 second-class private baths for ladies and 18 first-class and 41 second-class private baths for men besides douche baths, &c. Separate entrances are, of course, provided for men and women, but both are situated in the central or administrative block, which fronts Melmoth Place. The public washhouse is situated in Hartismere Road, and is attractively built and finished. It contains stalls for 66 washers, a like number of drying horses and four hydro-extractors. A large ironing-room is also provided. The boilers are placed under the washhouse, while adjoining is the engine-room and well-house. A furnace chimney, 80 feet high, is also provided and built entirely detached from the building. There are, of course, the usual attendants' and general offices. The whole scheme has cost over 60,000*l.* Mr. H. Dighton Pearson, of Chancery Lane, is the architect.

ON Thursday, April 25, the ceremony took place which marked the completion of the first stage in the scheme for the restoration of Paisley Abbey, the ceremony in question being the formal reopening of the venerable church. The general scheme provides for the restoration of the choir, the transept

NEW IMPERIAL PATENT

**SUPERFINE FLAX LINES**

The above article is now being manufactured in large quantities for Greenhouse Sashes, Public-house Sheds and other heavy work. The Manufacturers would recommend it for its strength, and the large amount of wear in it, consequent on its peculiar manufacture.

AUSTIN'S IMPERIAL PATENT FLAX SASH AND BLIND LINES (two Prize Medals awarded) the Manufacturers of the above articles particularly wish to draw the attention of the trade to their Imperial Patent Flax Sash Lines of which they are now making six qualities, all of which they strongly recommend, as they have given unqualified satisfaction to the trade for now over One Hundred Years. Proprietors continue to give their personal attention to the manufacture of these goods.

They also invite the particular attention of the trade to their IMPERIAL PATENT BLIND LINES, which are superior to anything yet offered.

They can be obtained of all Rope-makers, Ironmongers, Merchants, Factors and Wholesale Houses in town and Country.

N.B.—Please note that all our goods, as advertised, are labelled either inside or outside with our Trade Mark "The Anchor."

the central tower, and in the meantime the first section of the tower and the transepts has been finished, whilst the old choir Chapel or sounding aisle has been opened up, and a new organ chamber has been placed at the entrance to the choir. It has been the aim of the architect, Dr. Rowandson, of Edinburgh, to have the restoration work so laid out as to be in unison with the existing nave and the old portion of the edifice, and in this, as is shown by the improvements already effected, he has been eminently successful. The transepts, of which but a ruined gable was all that remained, have been admirably restored and brought into the church proper, and an excellent harmony has been effected in their junction with the nave. An impressive appearance has also been given to the transepts by the beautiful leaded-glass windows which have been placed in them. There are three of these windows, and the largest, representing prophets and evangelists, has been erected by Mrs. Polson, in memory of her husband. The restoring of the first section of the central tower has been a work of great magnitude. Every precaution has been taken to make the foundations thoroughly secure. The tower rises from four piers connecting the choir and the nave, and the section, 40 feet square, has been carried several feet above the level of the main building. Owing to the formation of the piers four arches have been formed between the pillars, the ceilings being beautifully groined, whilst the ceilings of the transepts are of gracefully carved woodwork. By restoring of the transepts additional space has been added in the nave, and the sitting accommodation of the church has been altogether increased by about 400. Advantage has been taken of the improvements to introduce the electric light into the edifice. The work so far completed has been in progress during the past three years, and has cost fully £10,000.

#### BUILDING AND BUILDERS.

A visiting committee of the East Riding Asylum require £1,000 for extension purposes, including the erection of a new wing for 120 patients. The Ayr Corporation have accepted the tender of Mr. James Watson, Ayr, amounting to £1,753 10s., for drainage contracts. No. 10.

THE Holbeck Guardians have accepted tenders amounting to £6,924 for part of the work connected with the extensions and alterations at the workhouse.

THE memorial-stone of a new United Free church, to be dedicated to St. James, which is in course of erection in Kilmalcolm, N.B., at a cost of £11,000, was laid on Saturday last.

THE United Methodist Free church, Westcliff-on-Sea, was opened on April 30. The style is Perpendicular. Messrs. Battley, Sons & Holness were the contractors, and Messrs. G. & R. P. Baines the architects.

THE scaffolding upon which Frank Dobbs, of Birmingham, and William Carr, of Burton-on-Trent, both steeplejacks, were working on a chimney at Cheetham & Hill's foundry, Derby, collapsed on the 28th ult. Both men fell 50 feet, Dobbs being killed outright. Carr broke his fall on the roof of a shed, through which he crashed on to some barrels, sustaining concussion and broken ribs. He is still unconscious.

AT last week's meeting of the Dudley Board of Guardians the building committee reported that the estimated cost of the new laundry, washhouses and boiler-house was £11,000, which included the cost of boilers, architect's and quantity surveyor's charges, salary of clerk of the works, cost of raising loan and contingencies; and they recommended that Mr. J. A. Fullwood, of Sedgley, mining engineer, be employed to make an inspection of the fireclay workings under the site of the land on which it was proposed to erect the laundry building, &c., and that his report be forwarded to the Local Government Board. They further recommended that the Local Government Board be asked to allow the sum of £1,163 10s. 2d. per cent. consolidated stock, being the unexpended balance of the sale of fireclay, to be applied towards the cost of the new laundry buildings. The report was adopted.

THE half-yearly meeting of the Scottish Building Trades Federation was held last week. Mr. Robert Lamb, builder, Edinburgh, president, in the chair. Members were present from various parts of the country, including Glasgow, Edinburgh, Dundee, Aberdeen, Perth, Kilmarnock, Stirling, Inverness, Coatbridge, Airdrie, &c. The secretary, Mr. James L. Selkirk, submitted the report, which detailed the work carried on by the executive during the past six months. The subjects referred to therein were severally considered and discussed, and a number of important resolutions were come to in regard

to future operations. These had reference to organisation, trade disputes, working by-laws, conditions of contract, finance, &c. A resolution was arrived at to render the federation a still more efficient instrument for the promotion of the various objects for the furtherance of which it was instituted. An influential deputation from the National Association of Building Trades' Employers of Great Britain and Ireland attended, and addressed the meeting in encouraging terms.

### ELECTRIC NOTES.

ADMIRAL SIR HENRY NICHOLSON, K.C.B., chairman, and the directors of Electric Lighting Boards, Ltd., entertained a large party at luncheon at the Criterion Restaurant on Friday last to meet Miss A. Ashton Bence on her departure for the Cape on the company's behalf, the party including Sir James Weeks Szlumper, D.L., J.P., Professor R. H. Smith, M.Inst.C.E., Mr. Edwin O. Sachs, A.M.Inst.C.E., Major Fox (London Salvage Corps), Dr. Hoffman (Home Office), Mr. Max Byng, M.Inst.C.E. (General Electric Company), Mr. F. R. Farrow, F.R.I.B.A., Mr. Paterson (Johnson & Phillips), Mr. Bloxam (Abel & Imray), Mr. Crick (Rose-Innes, Son & Crick), Mr. Theodor (Theodor & Rawlins) and a number of friends and experts. Miss Bence, who was the recipient of many flattering telegrams, was congratulated on her enterprise, by Sir Henry Nicholson and wished "good speed" by Sir James Szlumper on her arduous task at the Cape, which has much similarity to that of her successful visit to the United States in 1901, when the company's properties in America were sold for a very large consideration. Major Fox thanked the chairman for the visitors, and concluded the proceedings by entertaining the party at the Shaftesbury Avenue station of the London Salvage Corps.

CONSIDERABLE progress is being made in the erection of the electricity generating station at Oban, N.B. The buildings are now well advanced, and gangs of men are engaged on the system of distribution. When completed the power will be generated from Babcock boilers, three 100 horse-power steam dynamos and electric accumulators. Mr. H. R. T. Burstall (of Messrs. Burstall & Monkhouse, London), the consulting engineer, gave an interesting lecture in the Oban Hall, and with the assistance of numerous lantern slides described the system being adopted. Mr. Burstall showed and explained the many purposes for which electricity could be used in buildings, &c.,

as in lighting by arc and incandescent lights, power heating. Mr. Robertson, the convener, explained that he hoped to be able to supply the current for lighting at 6d. unit and for power at 3d. per unit, and, if so, consumers would find there would be a large saving in comparison with the cost of gas, which at present is charged at 7s. 6d. per 1,000 feet. Mr. Robertson pointed out, however, that the rate of current to be charged must depend on the consumption of applications. The convener intimated that a contract had been entered into with Messrs. Claud Hamilton, Ltd., electrical engineers, Glasgow, whereby this company is appointed wiring contractors to the Council, and will undertake the fitting of buildings for lighting and power on a deferred payment system, extending over five or seven years, at rates approved by the Council, the work being carried out to the satisfaction and approval of their engineer.

### ROYAL SCOTTISH SOCIETY OF ARTS.

THE tenth meeting of the current session of the Royal Scottish Society of Arts was held on Monday night in the hall, George Street, Edinburgh. Mr. Norman D. Macdonald, advocate, made a long communication, in which he dealt with some railway problems considered from the standpoint of American practice. Touching on the problem of the track, he commended the ease of railway travelling in America, partly to the excellent build and design of the rolling stock and more so to the absence of "chairs." Whether in locomotive the Americans were well ahead of us in the matter of railway track, though they were not yet content. As yet we did not seem to understand the question of curves. In America great pains were taken in laying out curves, with the result that there was an entire absence of jolting and lurching. We were behind also in the signalling as compared with America, where the safety and convenience of the arrangements were very great. The brake system was likewise superior, the problem of control and couplers having been solved in the States. We were still years out of date on this subject, but he was glad to say that within the past few weeks a Great Western locomotive had appeared with brakes on bogey wheels. Subsequently Mr. Macdonald discussed in detail the locomotive power on American railways, enlarging

different types of engines and their outstanding features. Interesting collection of slides of locomotives was shown on screen, and it was observed that our railway men con- excused themselves for not having more powerful engines by pointing out that the tunnels in this country pre- sents from getting so big ones as other nations. That was true, but even as matters were we had not got to the limit of power. Finally, Mr. Macdonald praised the com- mand luxury of the American passenger coaches, and re- d that evidently one of the problems that had not yet been grappled with in this country was the thorough cleaning of coaches. At the close, Mr. Macdonald, whose paper was fully illustrated, was awarded a cordial vote of thanks.

## METROPOLITAN BAKERIES.

Last report Dr. Dudfield, medical officer of health to the borough of Kensington, has the following remarks on the construction of bakeries, a subject which has not yet received attention of the authorities which is demanded by its importance:—

Viewed from the public health point of view, probably the most important part of the new Act is of more immediate or greater interest to the sanitary authority than that relating to bakehouses. As in London, the defects of the places where bread is made are largely dependent on two factors—(1) That the premises are not constructed for the purpose, and (2) that they are on bad ground. Ere long the borough councils will have to face the question whether these underground premises are sanitariously constructed. When the Factory and Workshop Act, 1895, became law, it was hoped that (by sub-section (3) of section 27) a step towards the abolition of underground bakehouses had been achieved; but this hope was not realised, although the defect in the sub-section had been rectified, under circumstances to be related later. The Act of 1901 did nothing to immediately secure the desired object. But there is hope in the future, and we wish to draw the attention of the Council to the matter, yet there is time to avoid, in respect of bakehouses, the mistake resulting from the inaction of the sanitary authorities, between 1856-73, in regard to private slaughter-houses. With few exceptions the bakehouses in the borough are on bad ground, being generally the two basement

rooms—kitchen and scullery—of an ordinary dwelling-house, adapted by the construction of one or more ovens under the footway of the adjoining street; imperfectly lighted by a hinged sash in the stall-board of the shop, this, moreover, being the principal if not the only means of ventilation. In practice, however, the window is seldom opened, for operative bakers who work in great heat are very susceptible to the effects of draughts—and when opened it admits dust and other street filth blown in from the carriageway. It would seem impossible to a sanitary authority to "certify" a bakehouse so situated, so constructed, so ill-lighted, and practically un-ventilated, to be "suitable" for the purposes of a business demanding the utmost cleanliness.

But we have not yet done with the new provisions of law, for it is further enacted in sub-section (7) that—

"In the event of the refusal of a certificate by the District Council, the occupier of the bakehouse may within twenty-one days from the refusal, by complaint apply to a court of summary jurisdiction, and if it appears to the satisfaction of the court that the bakehouse is suitable for use as regards construction, light, ventilation and in all other respects, the court shall thereupon grant a certificate of suitability of the bakehouse which shall have effect as if granted by the District Council."

In a word, a single magistrate, who may be without practical knowledge or experience in regard to the matter, may override the decision of the District Council, a sanitary authority acting upon the advice of their expert officers.

It is, of course, to be hoped that no such conflict will arise in the execution of the law, but that the trade will themselves take steps to bring matters to a satisfactory settlement in conformity with the requirements of the Act and the necessities of the case. It should not be difficult to establish co-operative bakeries, if it were found impracticable for each baker to provide himself with a suitable bakehouse above or underground. Probably a solution may be found in a new system, under which bakers' shops should become, in the main, distributing agencies or places for the sale of bread made in large wholesale bakeries, where this staple article of human food shall have been prepared by machinery. Nothing better could be desired—looking at the matter from the point of view proper to the sanitary authority. In any case, the matter should not be allowed to drift, for if the bakers do nothing, and if the sanitary authorities fail to make their views known, it may be alleged, and not unreasonably, on the expiration of the period of grace, that the people cannot be supplied with the "staff of

life" should "unsuitable" underground bakehouses be closed, in conformity with the express provisions of the new Act.

### LIGHT AND SANITATION.

AN address was delivered by Sir J. Crichton Browne on "Light and Sanitation" at the Sanitary Congress in Manchester. He said:—We have scriptural warrant as well as personal experience for believing that the "light is sweet," and that it is "a pleasant thing to behold the sun." And my thesis this morning is that it is not only a pleasant but a wholesome thing to bask in the rays of that great luminary. And in submitting that thesis to you I am asking your acceptance of no new doctrine, for it has long been held almost all over the world that certain salutary influences emanate from the sun as part of his radiant energy. True, the sun has been accused of morbid as well as of healthful operations. Snow-blindness, certain cutaneous eruptions, and sunstroke have been justly laid to his charge, and, like the moon in the matter of lunacy, he has had to bear the blame of visitations of which he has been wholly innocent. But whatever his pathogenic misdeeds, real or imaginary, may have been, they have been far more than counterbalanced, even in popular estimation, by his beneficent and healing powers, and in many countries we hear echoes of the common Italian proverb, "Where the sun does not enter the doctor comes," and find prevalent the practice of exposing to his bleaching and cleansing processes clothing, bedding, and other articles liable to pollution. Much patient investigation is yet necessary as to the action of light on bacteria. We want to know its action, in different degrees of intensity, on different species in different surroundings, but even now what we know of its action on the disease-causing varieties warrants us in hailing it as a sanitary ally of the first puissance in our combat with disease. That cannot be too strongly insisted on. We know already that bright sunlight is fatal to many of our most dangerous and insidious enemies amongst the bacteria, and that even the feeble rays of the winter sun will often suffice for their destruction. We know that the slow and sustained action of light, even of comparatively low temperature, on these bacteria, when they are not killed by it, so alters their behaviour that they are afterwards different from bacteria not so acted on in their power of fermenting organic substances. We know that when the spores of bacteria escape into the air, and are there enveloped in the direct rays of the sun, they

gradually deteriorate and lose their pernicious qualities. We seem to understand why epidemics due to parasitic fungi so often associated in people's minds with dull, cloudy, sultry weather. We realise that that pencil of sunlight that planet intercepts and that whisks round its circumference in its revolutions on its axis is, if I may use an ignoble simile, like a mighty scavenger's broom, sweeping before it the noxious and injurious matter. We conclude that it is a sanitary obligation upon all of us to give the light free play, to do no more that can hinder or obstruct its salubrious progress. Light has more deep and intimate human relations of a sanitary nature. Light is a necessary condition of mental and bodily well-being. Its tonic psychical effects are everywhere recognised. properly organised men and women love the light, and it is merely to children that darkness brings with it a sense of powerlessness, danger and alarm. But whatever the therapeutic values of the different rays of light may be, white light, heaven's own mixture, is the normal cerebral atmosphere, variations in its intensity have probably widely diffused constitutional effects. These, however, are not always immediate and obvious, but often remote and subtle, and grave errors have arisen from confusing the primary psychical with secondary somatic consequences of light in the human organisation. Light is instrumental in preserving health and maintaining it at a high standard by its immediate effects on the individual man, psychical and trophical, as well as by its action in safeguarding him from microbic attacks. Light is a sanitary agent of the first order, and it behoves all good sanitarians to spread the light, to conserve the light, and to protect it from pollution.

In this country, until a very recent date, there were actual legislative restrictions on the enjoyment of this common necessary of life. The window tax, which was instituted in 1696 and continued in force until 1851, among other evil results, blighted domestic architecture for 150 years; it undermined in some degree, the physical vigour of the people, and stamped on them decrepitude from the vestige of which we are doubtless suffering to this hour. The effect of the window tax was to accustom the people to dingy dwellings, and I question whether we have even yet arrived at a state of fenestral perfection. It is for practical sanitarians to insist on the big window and open window, and to teach that the light and air that thus admit sweeten and disinfect the house, and prevent sickness and divers diseases. But the big window will not be of much avail if the light cannot gain access to it, and its situation

its size is therefore of sanitary importance. It should be placed that it is not heavily overshadowed, and that the light during some part of the day can directly fall on it. Here we encounter the great crux in connection with sanitary-house-building in our towns and cities. It is impossible to do without anxiety the piling-up process that is going on. The walled towns of yore the houses grew aloft, acrogenously, on storeys, because lateral expansion was impossible in the protected area, and in the industrial towns of to-day the considerations as rigid as stone walls create enclosures within which accommodation can only be found for crowds that press into them by packing them tier on tier. The general skyward movement is in progress. Artisan dwellings, warehouses, shops, mills and mansions go on adding to their stature, and lengthening and deepening the streets around them. There are streets in London that are like tunnels, courts like damp cellars, rooms innumerable—in fashionable quarters—that no glint of sunshine has ever reached. Little wonder that so many of our London children—Lancashire children, too—are puny mites, with poor, thin and flabby muscles. In dealing with that housing problem which should occupy the most prominent place on the mind of every social reformer, and on the solution of which the attention should be concentrated, it should be steadily in mind that every human habitation or block of habitations should be surrounded by a belt of light as inviolate as the silver sea that surrounds our island. It will be of small avail that we provide open spaces about dwellings and enlarge our windows if at the same time we leave the window of the sky to be blurred and darkened, and unhappily what is going on all over this England of this is the age of smoke in which we are living. Our population has increased, our industries have multiplied, our streets have become condensed and extended, and over every town, great and small, hangs a canopy of soot and noxious fumes more or less dense, veiling the sun and cutting off its benign influence. Nor does the carboniferous rest upon its urban bed alone. It streams away into the surrounding country, defiling it and stifling its vegetation in animal life. Lancashire is a forest of tall chimneys, and every factory shaft emits as much smoke as 200 domestic stoves. You are smothered in the products of combustion year round; in winter these settle down on you in fogs, and horrible, and you must go far afield before you can find a sheep with a white fleece or pick a flower or blade

without soiling your fingers. A sable incubus embarrasses your breathing, a hideous scum settles on your skin and clothes, a swart awning offends your vision, a sullen cloud oppresses your spirits, and you quietly tolerate all this, apparently having come to regard it as inevitable and as a penalty inseparable from industrial prosperity. But is it so? Assuredly not. It is certain that this smoke nuisance is to a large extent the offspring of culpable negligence and profligate waste, and that it could be enormously abated, if not abolished.

He did not think the smoke evil would be put an end to by incessant prosecutions and cumulative fines, but rather by convincing the manufacturers that it is economical to avoid smoke-making, and that there are processes and contrivances now available for obtaining mechanical power in a smokeless and thrifty way. "Let there be light" was the first creative fiat, and it had to be repeated to-day. Then will the grass grow green again, the herb flourish after its kind, flowers blossom in our urban gardens, moss and lichens mantle on our city walls; then will the faces of our toiling millions again be burnished with the glow of health, while the pale pestilence that walketh in darkness will slink away abashed. Then, too, it may be hoped, the sleeping spirit of beauty amongst us will awake, at the touch of the auroral prince, from her long fume-begotten torpor, so that ugliness may depart from our streets and the glories of architecture again adorn them, while the refining influences of art exalt the national life.

#### MAIDSTONE BUILDING TRADES ASSOCIATION.

THE members of this Association dined together on the 25th ult. at the Bull Hotel under the chairmanship of Mr. R. Avar (president of the Association), Mr. W. F. Wallis (vice-president) facing him at the other end of the table. Guests and members present included Mr. W. West (vice-president of the Chatham Builders' Association), Major C. Pye Oliver, Mr. E. Vaughan, Mr. A. W. Smith, Mr. T. F. Bunting (borough surveyor), Mr. W. Jackling (sanitary inspector), &c.

The toast of "The King and the rest of the Royal Family" having been loyally honoured,

The Chairman proposed "The Imperial Forces," coupled with the name of Major Oliver, who, in reply, said the corps he had the honour to command had increased its strength in the past fifteen years from forty to 280, and had sent 150 men to the war.

Mr. West gave "Success to the Maidstone Building Trades Association." He said he wished success to every Association in the district, and more especially that at Maidstone, because it was one of the oldest associations in Kent, and it was due to the enthusiasm of the Maidstone Association that they at present had a society in Chatham. He thought they had everything in their favour at Maidstone for forming an organising centre for the South-Eastern District Federation. Their vice-president (Mr. Wallis) was one of the most active members of the trade in promoting that movement. It had been his privilege to attend several meetings in connection with the Federation, and he congratulated them upon having the services of such an able man as Mr. Wallis. The Federation of the Southern Counties had not perhaps been quite the success that Mr. Wallis and several others would have wished, but it was no fault of his, for he had done everything possible, and it was hoped he would see a great reward for the vast amount of labour he had put into the Federation movement. They also had reason to congratulate themselves upon the very successful issue to which they brought the dispute over the question of hours in several trades last winter. They at Chatham followed the trend of that dispute very carefully, because in a measure they were labouring under the same difficulty in the winter. The step taken at Maidstone was one in the right direction, and he had given notice to the Chatham Association that he would propose the adoption of the same rules for that district.

Mr. Wallis in reply said he had always taken a deep interest in the Association. He recognised that they were not so well organised as the workmen, and they had the architects and surveyors also with their well-organised Institute. The workmen's organisation was exceedingly well-managed, and they had enormous funds and knew how to use them. Although they (the builders) were organised locally and had carried their point with a certain amount of success, they wanted to be fully respected by the men, and therefore should form a larger organisation, and with this view he went somewhat strongly into the idea of the federation of the Southern Counties. He was sorry it had not been taken up generally with the enthusiasm it deserved. The workmen's union, however, only had small beginnings, and he was not without hope that their own Federation would in time develop into proportions that would command the respect of both sides. The great stumbling-block was the question of finance. The workman, very much more alive to his interests than the employer, put by a considerable percentage of his earnings, placing them in the hands

of his Society, and the builders ought to make up their minds to do something similar and consider it as an insurance fund. If they put by a corresponding amount to the insurance they would have greater freedom from trade disputes. Apart from the men, the Federation would give them a better status with the architects and surveyors in dealing with forms of contract they were sometimes called upon to sign. The London Association had been trying for ten years to get a better form adopted, but the architects had not accepted their views. The speaker suggested the formation of an association amongst the towns in the centre of Kent on similar lines for the insurance of the employer against accident to the workmen, with a reserve fund to deal with disputes.

Subsequently, in proposing the toast of "The Architects and Surveyors of Maidstone," Mr. Wallis said they at Maidstone were exceptionally fortunate in having to deal with gentlemen who ranked amongst the best architects and surveyors he had met with.

Mr. Smith in reply said he believed the building trade stood at present on a higher platform than ever it did. It had often been remarked that they could not put up buildings nowadays such as the ancients did. He did not agree with that people, but he believed in the fact that the fittest had survived. They had with them now examples of true and honest work, but those examples were few and far between. What had become of the ordinary buildings of past centuries? They had gone with centuries. The ordinary dwellings of the present, the work that was put up to serve the purpose of the time, had gone, and the monumental buildings alone remained. He believed the percentage that would remain after their time would be far greater than the percentage of buildings which had survived past ages. There was work they would not do to last as examples of what was done at the end of the nineteenth and beginning of the twentieth centuries, but there was good honest work that would compare with any in the world and it was upon that they would pledge their reputation.

For the "Town and Trade of Maidstone," proposed by Mr. Cox, Mr. E. Vaughan replied. He said he doubted whether the trade in the town was as good as it was some two or three years ago. He added that he had always been a trade unionist and if builders would combine not only would trade be increased, but work would be more harmonious between employer and employed.

Mr. R. Corben proposed "The Visitors," and Mr. B. St. John responded.

## THE WEEK.

A CURIOUS case which has interest for the building trade was brought last week on appeal before the King's Bench Division. About two years ago a man named READ who was twenty-five years of age apprenticed himself to Messrs. WIGG & WRIGHT, of Ipswich, and agreed to serve for three years, receiving only 15s. a week wages, on the understanding that he was to be taught the trade of a stonemason. The two masters as well as the men in their employment were members of the Friendly Society of Operative Stonemasons. They had agreed to the following trade rule:—"Apprentices.—That boys entering the trade shall not work more than three months without being legally bound apprentice, and in no case to be more than sixteen years of age, except masons' sons and stepsons. Employers to have one apprentice to every four masons on an average." It was not long before the Society objected to the new apprentice, and in consequence the man was obliged to keep to labourer's work. Afterwards a strike was threatened. READ, on account of the action of the Society, sued them for damages for maliciously inducing his masters to break the contract with him. The judge at the Ipswich County Court decided that there was no cause of action against the Society, as no improper motive could be alleged. The plaintiff accordingly appealed. Mr. Justice DARLING and Mr. Justice CHANNELL held that the County Court judge was wrong, and that there should be a new trial. The Lord Chief Justice considered that judgment should have been entered for the plaintiff, but as the other judges were not prepared to go to that length there would be only judgment for a new trial. His Lordship said the law in the case was established; for Chief Justice BIRLE had laid down that "the procurement of the violation of a right is a cause of action in all cases where the violation is an actionable wrong." The Society instead of taking action against Messrs. WIGG & WRIGHT for a supposed breach by them of the contract, if any, embodied in the rules of the association, did for their own personal ends procure Messrs. WIGG & WRIGHT to commit an actionable wrong—i.e. to break the terms of a special contract with the plaintiff. There was no evidence to show that the Society or any of its members would be injured by Messrs. WIGG & WRIGHT's fulfilment of their contract with the plaintiff. The facts negatived any suggestion that the action was taken on behalf of individuals to protect their own interests.

AN important paper on "The Timber Resources of the Australian Commonwealth" was read last week at a meeting of the Society of Arts. There is a desire to employ colonial timber as far as possible in England, but as information on the subject is not generally exact and time presses, it is no wonder that timber importers are not so much encouraged as is desirable. It was expected the Imperial Institute would help to impart knowledge concerning colonial products, but there is no use now in thinking over the failure of the project. Mr. E. T. SCAMMELL, the author of the paper, believes, first, that importers and users of timbers in Great Britain and Ireland should be prepared to give favourable consideration to the claims advanced on behalf of the woods of all British dependencies; second, that the British Government should do its part to assist the development of trade within its own dominions; and third, that the various States of the Australian Commonwealth, or better still the Federal Government, should concert measures for the conservation, management and development of the forest resources of each State; the classification, naming and testing of all timbers available for export; the provision of all necessary internal transit and other facilities in order to assist in the development of the timber industry in each State, and to encourage them to expend more capital upon it; the organisation of a bureau in the City of London, where samples of Australian woods may be inspected, and where the fullest information in regard to all timbers available for export may be obtained. The last suggestion is of especial importance. Hitherto attention has been mostly given to jarrah and karri, but

there are other woods which could be utilised in smaller quantities if particulars were forthcoming about their qualities and cost, and intended buyers could become acquainted with the appearance of sections.

THE golden vessels which were discovered at Boscoreale, and are now in the Louvre, were a revelation of the luxury of the ancient Italians, for there was nothing met with in Pompeii of equal importance. The Italian Government were too late to save the plate from exportation. Soon afterwards came the announcement of the finding of frescoes at Boscoreale, and no time was lost in adopting measures to keep them in Italy. Experts were appointed to examine the works and to report upon their value as works of art. It has been arranged as a result of the reports that five of the frescoes are to become the property of the State without payment for them. They are considered as treasure-trove. For the remaining works a sum not exceeding 15,000 lire will be paid. The owner cannot be satisfied with such stringent terms, but what power can an individual have against the Italian Government? England would have given a large sum for the paintings, for that class of art is almost unrepresented in the national collections.

WHY should not Stratford-on-Avon become like the court of Navarre—"a little Academe, still and contemplative in living art?" It is hardly worthy of its renown if it is contented to remain as a "show place." One effort of the right kind is the production of a shilling quarterly magazine, *The Shrine*, of which Mr. E. STOCK is the London publisher. The first number contains articles relating to SHAKESPEARE, such as the "Birthday Celebrations," the "Shakespeare-Bacon Controversy," "Hamlet and Ophelia," the "Phoenix and Turtle," the "Birthday Revival Play;" but other subjects are not neglected. There is an account of the social experiments in East Aurora, near Buffalo, of Mr. ELBERT HUBBARD, who is supposed to have drawn inspiration from the late WILLIAM MORRIS; but the American devotes all the money he earns by writing, publishing and lecturing to a common fund, and participates in the common life. There is room in the magazine world for a new aid to enjoyment which will be inspired by the Shakespearean spirit, and *The Shrine* merits a welcome from those who love life, literature and art.

ALTHOUGH Great Britain has many rivals, it cannot be said that the products of this country have been ousted from all parts of Europe. Even in Germany the desire for British goods of various kinds is increasing. It must, however, be regretted that the study of the markets is not more general. The British Consul at Stettin, in his last report, says:—"No inquiries (with a view to sales) have been received during the past year from manufacturers or exporters of the various saleable goods; no doubt the small number of articles of British origin exposed for sale here may largely be attributed to this fact. It is to be regretted that the remarks and suggestions contained in consular reports are not more widely taken notice of by technical and industrial publications and thus made known in interested circles, from which criticisms might often be of value to consuls, endeavouring to push British trade, who are frequently unaware if their efforts are made in the right direction." According to Consul BERNAL, "The gross profits of the Stettin Bredower Portland Cement Factory amount to 178,792 marks (8,939/), against 241,489 marks (12,074/.) in 1900. The cement and brick industry is at present in a very bad condition, and prices for these articles are still declining, but as the cement works have not been enlarged for some years, the output of cement was disposed of during the year. The brickworks at Stettin were regularly employed, but at Schwenz only one-half of the preceding year's output was reached, and could only be disposed of at prices which did not leave any profit." We are too ready to assume in England that Germans are conquering everywhere, and statements are made in the newspapers from which it is easy to infer that their trading is most profitable. It is evident, however, from official investigation that Germany, like other countries, cannot escape from depression of business.

## ARCHITECTURE AT THE ROYAL ACADEMY—II.

THE Central Hall, St. Paul's School for Girls," by Mr. G. C. HORSLEY, is among the works which will gratify a visitor. It would have served in the college which the Princess IDA established. The ceiling is a flat arch and is decorated. The galleries are supported on carved cantilevers, and there is an organ. Altogether the hall indicates the modern spirit of providing worthy accessories whenever refined education is sought. Mr. BODLEY's "Holy Trinity, Kensington," could hardly be simpler in form, for it consists of no more than four walls and a roof. Owing to the plainness of the building the beauty of the windows appears enhanced, for they are worthy of a costlier church. The "Billiard-room, Manhattan, Lancashire," by Mr. HUON A. MATEAR, is shown in one of the best coloured drawings in the collection. The room is luxurious in its arrangements, and the walls above the seats are adorned with special paintings. The design for the "Manchester Fire Station," from Messrs. LANCHESTER, STEWART & RICKARDS, if judged by the view alone would easily be considered as intended for a different purpose, for the various storeys might well serve as municipal or public offices. There is no indication of arrangements for the storage of fire-escapes or of tall gateways to allow them to pass, which no doubt would be found in some other elevation. As a study of fenestration there is skill in the arrangements. There are two views of a very large country house, "Castle Dyke," by Mr. J. B. MITCHELL WITHERS.

The "Proposed War Memorial at Winchester College," by Messrs. MARTIN & MEDLICOTT, shows an entrance and lodge with a common-room, which we suppose are in keeping with other buildings, but after a few years how are the limits of the memorial to be indicated? Mr. TEMPLE MOORE has two churches at Middlesbrough. In one the altar is approached by two flights of steps, and in the space between them a small crypt is introduced with a second altar beneath the high altar. This expedient recalls ancient usage, but the advantages are not obvious for a modern church. "Business Premises, Bombay," by Messrs. CASH & HACK, are constructed of a dark-grey stone; the lower part is formed as an arcade, while above are open recesses. Refreshing shade is obtained by the planning. "Marlborough Chambers, Jermyn Street," by Mr. REGINALD MORPHEW, consists of flats and shops. The corner is emphasised by planning the rooms in order to give some resemblance to a tower, if such a word is applicable to a peaceful projection. The "House at Welwyn, Herts," designed by Mr. R. A. BRIGGS, might well be thought from its reposeful appearance to have at least a century and a half of existence; the effect is not so much due to the curved gables and square windows, but to the absence of fussiness. His "Piazza and the Porch of Cowley Manor, Gloucestershire," shows how much can be gained by the use of detached columns, than which no more graceful architectural form has been devised. By the same architect is also a "Mission Church at Pentonville," the cost of which should be stated. It is constructed mainly of timber, and is sufficiently picturesque to make a congregation contented with it. In Mr. PEACH's "Power-station, Grove Road," the chimney is the most striking feature; it is square on plan, with sloping sides, but on the faces in the upper part the form of the windows in the offices has been imitated. It might not unnaturally be presumed that a glass opening was contemplated. For "A Dining-room at The Boltons, Kensington," Mr. COLE ADAMS has designed a frieze of conventional ornament, consisting of repeats, without any union. The lower portion of the room is panelled, the intermediate space being dark-red. The geometrical forms are now old-fashioned, because much freedom in flowing lines is obtainable without great exercise of ability.

"St. Anne's Cathedral, Leeds," occupies a fine site, but the lugubrious drawing presents before us a building that might be destined for penitential purposes only. If shown in a different style Mr. EASTWOOD's church, which is Gothic with square buttresses, would appear to more advantage. The interior includes a high altar and baldachino, which may become effective. Mr. E. NEWTON's "House at West Green, Winchfield," has sharper gables than he usually employs. The attempt to make a key pattern of plain bricks is a curious experiment. "The Saracens' Lair, Mayford," by Mr. W. F. UNSWORTH, is another example of

the use of strong timbers which can be made to express a style of their own. Mr. J. J. TALBOT has a two storeyed Liberal Club at New Ferry and a pleasing house at Bromborough. In the two drawings by Mr. H. INIGO TRIGGS we have, besides houses, small formal gardens, each containing a statue and fountain. Mr. R. G. HAMMOND in "13 Charles Street, Mayfair," offers another attempt to solve the difficult problem of dealing with a very narrow frontage. Height rather than width expressed in the windows and entrance-porch, and the result is successful.

In Mr. NICHOLSON's scheme of decorations for St. Matthew's, VIEWSLEY, the spandrels and such wall space as is available are utilised to represent Scriptural and ecclesiastical incidents. An attractive interior is sometimes secured in that way, but it must be allowed that architectural forms become of little account. "The School of Domestic Training, Colwall," by Mr. F. W. CATTERALL, is more like a mansion than a place for training servants, but on that account it is probably better adapted for its purpose. "The Institute of Journalists," by Mr. H. L. FLORENCE, will be a red brick building, with the name in big letters on the front, symbolising that business and not dilettanteism is to be found there. The design for the "Hereford Municipal Buildings," by Mr. MILNER ALLEN, is less pretentious than most modern buildings of the class. It has only two storeys, with round-headed windows below and square above. There are two gateways besides the entrance, with turrets over them. Another design for the same buildings is by Messrs. CRANFIELD & POTTER, and is no less suitable. Mr. A. MITCHELL has a vigorous pencil-drawing of "The Willows, Northwood;" the bay windows are semi-hexagonal, and in the space between the storeys swags are introduced of graceful form. The drawing by Messrs. KARSLAKE & FORRESTER, of "Clare House, Beckenham, Kent," is somehow suggestive of an old-fashioned roadside inn, to which additions have been made as necessity arose. Mr. RAVENSCROFT's design for a "London Terrace-house" has more resemblance to four quiet, small, red-brick houses, but they are too simple for the average metropolitan terrace. "Guildown Grange, Guildford," by Mr. JOHN BELCHER, is a country house showing much variety, a part being curved on plan. In the two gardens of Tapeley Park and Cornbury Park, water, which is said to be the eye of a garden, is introduced. The "Business Premises, Fleet Street," will not be unlike others in the vicinity, and the "Board-room, Electra House," seems to have been designed with a view to the display of busts, portraits and models of ships.

In the "New Organ Gallery and Case, the Chapel, Haileybury College," Mr. REGINALD BLOMFIELD has adopted a florid type of Renaissance. The organ-case is close to the balustrade forming the front of the gallery, and the upper part projects a little. The whole is suggestive of costliness, as if the instrument were an important auxiliary in the services. The "Entrance and Vestibule, Brocklesby Park," is another excellent Renaissance composition by the same architect, in which skilful use is made of columns. The pediment over entrance is filled with sculpture, and the vestibule is lighted from above. The "Electric Station, &c., on the Severn," by Mr. GEORGE HORNBLLOWER, is well grouped, and might be taken for a twentieth-century fortification. It has little of the factory in appearance, for the windows are small. It is the most satisfactory of the manufactories in the room. In Mr. P. WATERHOUSE's "Maurice Hostel, Hoxton," the stone or terra-cotta piers are so treated that they form, as it were, a frame for the brick walls and windows. The front is very narrow, but has nothing commonplace, and cannot be passed unobserved. Mr. G. C. HORSLEY's "Church at Longdon-leek," has a low tower on which a crucifix is sculptured. It consists of a nave and aisle with a baptistery at one end in line with the chancel. "A Commemoration Bridge" is a novelty. It is by Mr. A. S. JONES. The waterway runs through masonry arches of elliptical form. The roadway is covered, with arched openings at the sides for lighting. In the centre and at the ends are buildings. But the composition becomes prosaic when we find the expensive ornamental structures are to be devoted to hairdressing, dining and reading-rooms. It is no wonder engineers are amused at the projects of architectural bridge builders.

The "House near Skibbereen," by Mr. R. S. BALFOUR, must be unlike all others in the neighbourhood. The walls are white, the roof is of red tiles, and a platform enables the approach of moonlighters to be observed, the whole having a variety that is not characteristic of an Irish house. "St. Mark's Church, Plumstead," is another Romanesque building. Mr. MILEHAM evidently believes in the advantages of a dim religious light. The screen is carried right across through nave and aisles. The novelty of the attempt will excite emulation. Sir THOMAS DREW's "Queen Victoria Memorial" is only a drawing of the triumphal arch which it was proposed to erect at the entrance from Spring Gardens, and which would stand out effectively in such a position. The new chapel for Tonbridge School, by Mr. CAMPBELL JONES, appears to be an unusually lofty Gothic interior. A light stone is employed, and coloured panels, probably paintings, are introduced beneath the windows. The chancel window is large, with painted glass. The "Proposed Orphanage near Farnham," by Mr. J. H. CORAM, is a large plain building flanked by one-storeyed structures, which we presume are to be used for workshops. "The Extension of the Stock Exchange, London," suffers from the deficiencies of the drawing. Like the existing building the style is Italian. There are large arches and coffered ceiling; care seems to have been taken with detail. Mr. ROBERT L. COLE is the architect.

Mr. HARRY SIRR in the "Wing for Boys' School, St. Augustine's, Kilburn," consisting of covered playground, classrooms and drawing room, has paid attention to the style of the existing building. Mr. A. KOCH's "Reformed Church, Rorschach, Switzerland," should be accompanied by a plan. From the grouping of several piers round a central spire, it may be assumed that the usual cruciform plan has not been followed, and that an octagonal one was substituted. The combination of piers is satisfactory, and the building is welcome from its novelty. Mr. FALKNER's "Entrance Gate for Strangers' Corner, Farnham," will be a simple work, but it attracts attention from the character of the drawing, which might have come from Mr. NEW's hand. "St. Andrew's Presbyterian Church, Blackrock, co. Dublin," of which Messrs. MURRAY & FORRESTER are architects, indicates that Romanesque has gained a footing in Ireland. The tower is the most successful feature. An effort has been made to produce a building that would be as light as ordinary Gothic, but some of the vigour of the style has been lost in the process.

"St. John's Church, Byfleet," is one of Mr. CARÖE's picturesque buildings. Timber seems to be combined in the buttresses. The tower is small, and the church is well adapted to its position. "The Pupil Teachers' School, Barnsbury," has more of an Italian spirit than Mr. BAILEY generally allows himself to be imbued with. Mr. RAINE's design for a memorial church is striking from the extent to which verticality is expressed by parallel lines. The memorial for a public park by Messrs. WILSON & OGLESBY consists of a clock tower, the upper stage making a graceful termination, in which seated figures are introduced. Messrs. HOARE & WHEELER have elevations of "Three Town Houses" in one frame, each different in character, the most important being one in New Cavendish Street, in which stone and red brick are combined. The "West Riding Union Bank, Leeds," by Messrs. OLIVER & JODGSHUN, is a good type of the modern bank, and of the advantage which is gained by employing sculpture as an element. From the general scheme of the new buildings for the University of Birmingham we perceive that the American plan has been adopted by Messrs. ASTON, WEBB & INGRESS BELL, of arranging the buildings on a semicircular line, a plan which is not without its utility. With the exception of the central building, there is uniformity among the others. Each is surmounted by a flat dome, and has a frieze which will, no doubt, be explanatory of the kind of instruction imparted within.

"The Lower Hall of the New Sessions House for the City of London," which is a part of Mr. MOUNTFORD's design, should be taken as a hint by the dilatory Corporation, for the commencement of the building has been so long delayed. The hall is a vigorous composition and befitting its purpose. Tuscan columns and pilasters are employed, coloured materials but of a sober colour are utilised, there are recesses for consultations. A staircase

leads to the courts above. "Helnestowe, Abingdon" (Mr. H. REDFERN, architect) is a dwelling-house and offices so placed as to appear in connection with the church. The design for entrance-gates to a public park, by Mr. RALPH KNOTT, imparts an impression of substantiality from the masonry in the centre and at the ends. The railings are plain and the effect mainly relies on the masonry. Messrs. OSWALD & SONS show new offices at Newcastle-upon-Tyne, which are cleverly designed, and the stepped gables do not seem out of place. The "Consumption Sanatorium, Delamere Forest," by Mr. CECIL HARDISTY, does not offer anything which is suggestive of novel treatment. It is a large three-storeyed building with two rows of balconies and with pleasing surroundings, which might have been intended for a hotel or hydropathic establishment. The decorations to "St. Mary's, West Kensington," designed by Mr. H. C. BREWER, are of an elaborate kind, for the drawing is like a page from some illuminated manuscript in which the fine colour is heightened by an abundance of gold. "Vulcan Buildings, Upper Thames Street," by Mr. C. REILLY, show a difference in treatment between the buildings at the corner of the site and the adjoining warehouses. The block will be an improvement to the busy thoroughfare. Mr. E. P. WARREN has "Four Houses and Shops in High Street, Oxford," which are quiet examples, grey stone being used for the walls, with projecting windows on the first floor. Another of the large country houses is "Briar Dene, Cheshire," by Mr. ATKINSON. Mr. GEORGE JACK's "New Room, Great Tangley Manor," has a gallery over the fireplace, which is an unusual position; the walls are hidden by tapestry and the lower part is of panelling.

The "Covered Market and Corn Exchange, Hull," by Mr. J. H. HIRST, is another combination of red brick and stone, with one of those towers of which the utility is rarely apparent. Mr. S. RUSSELL's "Restaurant and Club, Stratford," is a more extensive building than the name indicates. On the ground floor there are large arches, sculpture is employed, and the use of piers adds vigour to the front. "A Town Club-house," by Mr. A. E. CORBETT, is noteworthy from the numerous vertical lines. His design for a chapel and school at Ilkley is not without originality, especially in the tower. "A House in Germany" is shown in two drawings by Mr. BAILLIE SCOTT; a portion of the front is in half-timber, and as some of the rooms are curved on plan, the front seems a survival, or rather adaptation, of a feudal castle. The interior has an antique severity, but the painted decoration which is freely introduced can be considered as delicate. A corner of Fitzgeorge Avenue, by Mr. DELISSA JOSEPH, recalls a tower which becomes more striking from the arched openings adjoining it. Mr. W. H. THORP's design for the Burnley Technical Institute consists of two parts so dissimilar in character, it would have been well if there was a separation between them. In the "Dining-room to Mansion, Suffolk," which is one of Mr. PRENTICE's contributions, the chimney-piece rises in a large triangular pediment; there are no doubt precedents for such a form, but it cannot be said to be graceful, and it is illogical, for it suggests rain rather than heat. Messrs. MCKEWAN & SWAN show a part of the "Keighley Library," there is a capacious entrance, but in the wall above the only windows are small diamond openings with ornamental borders. Mr. F. WHEELER's "Mount Vernon Hospital for Consumption, Northwood," is placed on terraces. The windows are big, and some open on to a balcony which is carried along the front. It is an excellent example of the modern hospital. "St. Felix Schools, Southwold," of which Mr. ARNOLD MITCHELL is the architect, are of considerable extent and are skilfully combined.

Visitors to Port Sunlight have remarked the absence of a church. Services are held in the schools. In the paper read by Mr. W. H. LEVER before the Architectural Association he spoke of one that was in progress from the designs of Messrs. W. & S. OWEN, and he said the aim had been to produce an honest piece of work with every detail speaking of thoroughness and truth, and with such ornament only as would add dignity and produce reverence. The drawing for the building is now in the Academy. It is Gothic in style, and corresponds with many village churches. The grouping is effective, the window space is plentiful, and there is a low tower. It will be in keeping with the buildings around it, and will increase the interest

of the village. Mr. W. H. BIDLAKE'S west front of St. Agatha's Church, Birmingham, has rather a defiant aspect, with its tower in the centre of the drawing. No attempt has been made to enhance the effect by a perspective view, or to surpass the average character of the churches in the locality. Mr. W. BOURNE'S drawing of new buildings Park Gate, Darlington, shows a mode of treatment that is now generally adopted, *i.e.* the shops form a series of arches. There are arched windows on the first floor, and above they are square-headed. The semicircular arch is evidently in favour this year. In Mr. A. M. POYNTER'S manor house, "Mount Grace Priory," a long, narrow strip of land had to be used as a site. In consequence the rooms follow each other in this order—scullery, kitchen, dining-room, drawing-room. The building is, therefore, all side or length without breadth, and, under the circumstances, it is skilfully treated. The design for the "Lady Chapel, St. Patrick's Cathedral, New York," by Mr. CARÖE, is not, we presume, to be carried out, for in no church in this country would so costly an effort be realised. Finally, we must mention the "Queen Victoria Memorial, Bradford," by Messrs. ALFRED DRURY & SIMPSON, and the "Model of Dome, Electra House," by Mr. J. BELCHER. They are more explanatory to the public than any drawings, but the young people who find a refuge and relaxation in the room we understand object to them, because they imagine the models have caused the removal of a second seat.

### PAINTING AT THE ROYAL ACADEMY.

PAINTERS may be sceptical whether the pyramidal arrangement should be imperative in the composition of pictures, for a rule of that kind is considered to be too academical for our time. But there can be no doubt that instinctively the visitors to the Royal Academy and other exhibitions are dissatisfied unless the pyramidal principle is manifest. BYRON expressed his idea of English poetry by drawing a triangle with "the many" at the base and ROGERS at the apex, some other contemporaries appearing in layers between them. The visitor to exhibitions desires a similar disposition of merit. For the greater number of pictures he has no care; what he seeks is the dominant one, and having that fixed for him it is easy to dispose of the remaining works by a graduated scale.

It is an advantage in this year's exhibition for all who have a genuine love of art that the principle is compelled to be parallelistic rather than pyramidal. If the qualities of the pictures were to be ascertained in the old-fashioned way by allotting marks to colouring, modelling, &c., it would be found that there was a surprising equality among the results. This peculiarity should be accepted as advantageous, for it is preferable to have painters of average power than a few giants and a vast number of dwarfs.

It is easy for people who are without any clear notions concerning the production of pictures to express dissatisfaction with the greater part of what is to be seen on the walls of the Academy. We must always expect to have observers who can journey from Dan to Beersheba and see nothing but sterility on the way. There are, however, few annual exhibitions on a large scale which are without interesting works. The collection in the Royal Academy, if taken as a whole, possesses unusual variety, and testifies to an earnest desire of advancing on the part of several artists.

We have, for instance, this year at least three efforts in what has been long regarded as the highest class of painting. Mr. FRANK TOPHAM in his *What is Truth?* depicts CHRIST before PILATE. It is true the crucial difficulty of revealing a countenance expressive of the union of the human and divine is evaded, for we see only the back of a figure in a white robe tightly bound with cords. The arrangement, however, is allowable, and it enables us to witness as it were the manner of judging. We have the Roman or judicial aspect of the trial. The court and the attendants do not show any sign of that hatred towards the accused which is common in representations of the Passion. The merits of the picture deserve to be generally recognised. There are two figures of the Mother of CHRIST by English artists. Mr. VAL PRINSEP'S *The Virgin at Bethlehem* might at first be taken as a portrait,

for it differs from the majority of the types adopted by Renaissance or modern artists. Evidently the painter was desirous of expressing the realisation by the Blessed Virgin of the great duty which was before her and a resolution to fulfil it. As a character study, the figure is interesting. Mr. MELTON FISHER'S *Madonna* will probably be more admired. It shows another interpretation. We have heard of symphonies in blue; this might be described as a hymn in blue which was adapted for children. MARY appears as if she were a priestess in a cope richly ornamented, and fastened by a chain. She stands in a garden where tall flowers are blooming. A mist surrounds the scene, in which angels' heads can be discerned. It is comforting in an age like the present to see a picture with so much tenderness and ideal beauty, one which could be hung in a convent chapel and would inspire devotion. M. LYBAERT'S *Madonna of Ghent* is a less remarkable effort than either of the English works. He imitates Flemish precedents rather than creates. We must admire the fidelity and courage shown by the adoption of old methods, but he could at least count on an appreciation by his countrymen which is absent in England. The influence of the modern spirit is suggested by the expressing of ruling power on the face of the Child, for the majority of the Old Masters were satisfied to indicate no more than was seen among ordinary children.

Far apart as they are in spirit, mythological subjects are usually looked upon as being next in difficulty. We have no longer, it is true, a LEIGHTON, who had claims to be considered as a resurrectionised Greek. The President is satisfied with sending a small *Vision of Endymion*, which is among the cabinet pictures, for his *Storm Nymphs* belongs to a later time. Sir W. B. RICHMOND has a large work, *Hera in the House of Hephaistos*. Whether he is correct in representing the goddess muffled up as if she wished to be disguised is uncertain, but in this case the figure is of secondary importance to the famous chamber made by the metalworker of the gods, which was the prototype of all the modern strong-rooms:—

Then went she to her chamber, which her son  
Vulcan had for her made with door-posts high,  
And solid doors, which of the gods not one  
Could open but herself, such mystery  
Was in the lock and key. Then went she in,  
And fast she locked the door, and there alone  
She with ambrosia cleansed her dainty skin,  
Till not a speck unmeet was left thereon.

With such a subject an artist has to depend for evidence mainly on the palace of ALCINOUS which is described in the "Odyssey," and in which VULCAN also co-operated. The walls were brazen, the doors golden. But in JUNO'S room silver does not appear to have been used for the door-posts or the lintel. The richness of the apartment, which will be considered as no more than an accessory, may not appeal to the public, but it is an honest effort at realisation. In his *Aphrodite* Mr. BRITON RIVIERE has found a subject which is well adapted to display his skill. The goddess is seen hastening down the slopes of Ida, accompanied by several wild beasts, who for the occasion have lost their savageness. They are represented with the painter's customary power. But a draped Venus is a novelty and may not be accepted as appropriate. Opposite to it Mr. ALISON MARTIN'S *Evoe! Eleleu!* is worth attention as an animated Bacchanalian scene, which should have a better position. Mr. SOLOMON'S *Psyche* lying overcome on the ground was a difficult figure to attempt. It is not without pathos, but it is more French than Greek. The *Last Drive of Hippolytus*, by Mr. F. O. SALISBURY, shows the son of THESEUS rushing to his doom on the sea-coast. Few subjects are so exacting, since horses have to be represented as well as rocks and a foaming sea. The absence of the sea monster makes the scene more real. If compared with such legends Sir ALMA-TADEMA'S *Caracalla* appears almost modern. Although one of the smallest pictures in the exhibition, it will receive general admiration. The emperor is seen entering a building, several maidens are strewing rose-leaves before his steps, there is a slave, and spectators watch attentively the spectacle from without. There is less display of polished marble than usual, and it is introduced in columns, carved panels and other details. The floor is composed of white tesserae. Beautiful as are the

animate parts of the picture, they do not lessen the interest in the figures. It is exquisite in colour. The painting could serve for other emperors besides CARACALLA, and we can assume that similar scenes were common among the great patricians.

Among the historical pictures, the most interesting are those relating to our own time. Mr. J. F. BACON's scene of the Guildhall on the return of the Volunteers from South Africa merits the position assigned to it. Immense labour as required in its production, as it comprises some hundreds of portraits, but the toil is concealed, for the work is the appearance of being executed with facility. As a combination of colour it will seem strange in the eyes of foreigners, among whom is the belief that everything with red is dull and dreary. The expanse of khaki, the scarlet robes of the aldermen, the mazarine gowns of the common councillors, with much else that is brilliant, form a whole that is well combined. Another dazzling scene is the *In Memoriam* of Mr. JOHN CHARLTON, showing Queen VICTORIA on her way to St. Paul's Cathedral for the thanksgiving service. As in all spectacles of the kind, the principal figure becomes subordinate, which is an objection in an historical sense. The *Home coming of Charles II.*, by Mr. C. M. ADDAY, is enough to suggest that an English act of rejoicing should take place on the sea. Mr. ORCHARDSON's *The Borgia* may also be taken as a history piece, although it would be impossible to say which one of many murders made the subject. A small table has been laid out in the open air, at which are seated CÆSAR and a guest who has just collapsed under poison. Assumptively there were two more additional guests, but they have vanished or their bodies were carried off. The pines in the background and the place itself are suggestive of repose, so the tragedy is therefore intensified. Mr. J. COLLIER a few years ago produced a painting of the same kind. A change of title could easily make his *Plague* an historical picture. In it a lady dressed in white satin is represented suddenly overcome, and falls a corpse as a man enters with a lantern. The contrast between the face and white gown is skilfully brought out; the eyes are looking appealingly or upbraidingly at the visitor, who in terror has dropped his lantern. The two pictures we have just named may be considered as morbid, and it would not be a pleasure to look upon them several times a day, but as long as painters do they will endeavour occasionally to repeat the legend of the Medusa, and move spectators with terror. The most interesting historical picture is *Washington's Farewell to the Army*. The spot is on the banks of the Hudson, where he is about to cross the ferry. Even his countrymen who knew him best did not anticipate that he would withdraw to retirement so unostentatiously after such numerous victories. FRANKLIN, when he gave him the fine crab walking-stick, said "if it were a sceptre he has merited it, and would become it." WASHINGTON would not accept the slightest pecuniary recompense from Congress, and was contented with the consciousness of having faithfully done his duty. Mr. Gow has properly interpreted the event. It is sublime from its simplicity, and in the picture there is one stroke of brilliant colour. It is a harmony of greys, blues, white and green. Mr. Gow has not been afraid to utilise the large number of upright lines which the occasion offered. The tossed oars of the ferrymen and the piles of the landing-stage seem to be continued in the muskets of the troops who line the ground and stand like statues.

There is another class of subject which is also concerned with the past. When we find the President in his *Storm Nymphs* adopting an almost identical subject with Mr. J. DRAPER's *A Deep Sea Idyll*, we have a sign of the reality which we believe to be one of the characteristics of this year. The President's nymphs take delight in the silver plate which some Spanish galleon has cast into their sea, while the nymph of the younger painter seems exulting with the figure-head of a similar vessel. Both recall the Invincible Armada, and should be found together in some public collection. Mr. DICKSEE has courageously attempted *La Belle Dame sans Merci*, selecting the time when the knight has placed the enchantress on his steed and walks beside her. It is doubtful whether any artist will be able to paint forms corresponding with those which imagination creates when reading KEATS's ballad. All

the visible qualities may be in Mr. DICKSEE's work, but it wants the magic. Mr. MOUAT LOUDAN's *Sleeping Beauty* suffers from a like deficiency. There is a pleasing figure of a girl, and the amorini are childlike and silent, but what is desired is something that no model will suggest. The late PHILIP CALDERON some years ago painted a bewitching woman with a quaint head-dress as an illustration of the song in "Measure for Measure," "Take, O Take those Lips Away." It expressed a man's notion, and the time when it was painted was less cynical than the present. Mrs. FORBES's version is probably much more true and modern, for the singer is made younger than the lady, who is far from being a beauty. Perhaps in all ideal scenes it would be an advantage if it could be suggested that poetry and infatuation are akin. A neighbouring work, Mr. W. D. ADAMS's *Merlin and Nimue*, showing the seer kissing the robe of a scornful woman, has also its lesson, while it must be allowed the picture is boldly painted, and is as pleasing to look on as any small piece of tapestry.

The tendency in modern times is towards the representation of everyday life, and in this year's Academy works of that class attain a high standard. Mr. RIDGWAY KNIGHT's *Last Roses*, a French peasant girl in a rose-garden near a river, is an example of style which students of painting would do well to study. Mr. H. J. HALEY's *Heraldic Engravers* suggests how well daily labour can be transformed into a pictorial scene. The men are seated alongside a bench working by artificial light, and are as much engrossed with the objects on which they are engaged as if every stroke was paid for. But all the qualities of a good painting are combined on the canvas, and it is more pleasing than many ambitious works in the exhibition. Mr. H. WOODS's *A Venetian Water-Seller* is one of his most brilliant pictures, and is true in characterisation. Mr. LE THANGUE is again fortunate in his subjects, in which Sussex is shown under sunshine. In *Goshings* the birds in the foreground are matched by the trees and blossoms which form the background. In his *March Marigolds* the mass of yellow is subdued by the cows and geese, and in other works the artist and the observer are evident. With so much success there is the risk of falling into mannerism, and it is reassuring to find that the artist has been also drawing inspiration from Provence. It cannot be said that as yet the difference between the two classes of works is definite. The *Lighting-up Time* of Mr. STANHOPE FORBES is a very simple scene, showing poor people in a small cart returning from a village and lighting a lantern before departure. But the artist has already proved his power in dealing with artificial light. His *Chadding in Mount's Bay* shows children in a white boat fishing on a summer's day. Mr. FRANK BRAMLEY displays unusual breadth in the head of the old gardener who symbolises Time. Mr. GEORGE CLAUSEN suggests a wearied world by his *Homeward*, in which two farm horses are going back to their stables of an evening. Miss LUCY KEMP-WELCH has a masterly picture called *Ploughing on the South Coast, Devonshire*. In it are two teams of horses, some foreshortened, with sea-gulls that seek food in the furrows, while beyond is the Channel. We have thus a variety which is not often found in pictures of animals. The same artist's *Morning*, a horse standing over a wounded man in khaki on a bleak African plain, is pathetic without being sensational. Mr. F. A. BRIDGMAN affords us a glimpse of Eastern life in his *Moorish Villa at El-Biar*, which has none of the garishness generally found in such representations. Mr. R. W. MACBETH has delightful subjects in his *Faire Pledges of a Fruitful Tree*, in which a girl is seen in a garden with trees in blossom playing with a fawn, while the dog is more sad than jealous. In a different style but no less pleasing is his *La Coquille*, a French girl with a basket containing shell fish. *Grace after Meat*, by Mr. H. S. HOPWOOD, an old woman with a couple of boys, is as true to its subject as if it were painted by M. ISRAELS. *A Cornish Idyll*, showing a young fisherman and a girl, by Mr. WALTER LANGLEY, is one of the best of the incidents from that region, and happily there is no suggestion of a tragedy as in so many of the artist's works. The contrast between modern life and that of a past age could hardly be better suggested than by the

*Green Lizard* of Mr. C. E. PERUGINI, a painter who has the knack of bringing ancient ways vividly before us. In it we see two girls on a terrace, which is architectural, gazing at a tiny lizard which a youth playing on a pipe appears to control. So much leisure and capacity to be interested in trifles must excite the envy of busy men during their hurried visit to the gallery. In many modern pictures there is a suggestion of relationship between maternity and martyrdom. Mr. T. C. GÖTCH's *Holy Motherhood* might at a distance be taken for an enthroned Madonna with singing angels, or a copy of an Italian picture. The work is, however, a modern allegory, but it is never likely to come before those for whom it would be a consolation. As a revival of an ancient arrangement the picture is remarkable, but a French painter would not have hesitated to clothe the figures in the dresses of the poor.

The landscapes this year include foreign as well as English subjects. Mr. DAVID MURRAY has a series which is faithful to the beautiful scenery in the vicinity of Bolton Abbey. Mr. LOGSDAIL, who generally restricts himself to Venetian buildings, has a fine view *From Taormina to Etna*, which is boldly painted, and well expresses the characteristics of the South. Mr. H. W. ADAMS is very successful in *Malvern's Lonely Height*, in which we see a hill-top covered with snow, and with varying effects of light. As a picture, the sky, which presents nature with fidelity, will bear comparison with Mr. A. GOODWIN's *The End of the Pilgrim's Road*, where imagination is allowed to revel. No landscapes deserve more consideration than those by Mr. ALFRED EAST. His manner of treatment may be supposed by some as wanting the final touches which give effect and make views resemble reality. It is evident, however, that the painter has derived a consistent idea of nature, and has come to the conclusion that this idea of the relations and gradations can only be harmoniously expressed by subdued colours which will allow of proportionate effects. In an *Idyll of Como*, for example, Mr. EAST appears to treat a scene in the manner of WATTEAU, while in the *Valley of the Lambourne* we almost seem to look at the country through a veil. A different experiment is seen in *Morning Sunshine*, and a further test is offered in the view of *Gibraltar from Algeiras, Spain*. There is no landscapist whose works will better recompense scrutiny in the present exhibition. Mr. J. W. NORTH's *Isle of Avalon*, which is his only contribution, is less restricted in the use of a golden brown, but the figures somehow do not aid in increasing the effect of the trees, which could well dispense with them. Mr. J. FARQUHARSON is still faithful to snow, but in his *Winter's Night* he employs shadows of trees and sheep in such a way as to make the effect become weird. Mr. LEADER has four views this year, all of which give the impression of being hurried in execution. His *Old Manor House* is an attempt to represent HOOD's lines about the haunted mansion, but it must be admitted the painter has not been able to suggest the cloud of fear, the sense of mystery which should belong to the building. Too many of our landscapists are stay-at-home painters, and in consequence we have almost mechanical repetition of certain elements. Some have recognised this, and have tried to attain liberty by coming under the influence of foreign lands. Mr. MACWHIRTER's *Val Maggia, Locarno*, is a capital representation of a torrent which has come down from the heights without being utilised for factories on the way. It would be well if the example he gives were more often followed. Devonshire orchards are familiar to Academy visitors. Mr. L. G. MACARTHUR, in his *Worcestershire*, shows an apple-orchard of another kind, which is no less interesting. This painting, like some others on the walls, comes from a provincial artist, which is a satisfaction.

Mr. HEMY is the most successful with seascapes this year. There can be no question about their vigour, but in order to prevent his waves from growing stereotyped, it would be a gain if he were sometimes to show them under changed conditions. The sea is calm at times, and the colour is affected by sun, moon and clouds. In *A Letter from Over the Sea* the artist has made an excursion inland to a garden, and the fine colour is enough to demonstrate that Mr. HEMY need not limit himself to black, blue and white. Mr. W. L. WYLLIE has also emancipated himself from the Thames and the Tyne. *A Whole Gale of Wind*

is a marvellous example of wave-painting, when "the sea erects itself in ridges white." Mr. EDWIN HAYES has also gone to foreign waters, and we hope his *Italian Fishing Craft off Pianoso* will be a renewal of youth. Mr. COLMAN HUNTER and Mr. PETER GRAHAM are constant to the own precedents.

So much has been said about the portraits, they must by this time be familiar to all readers. Mr. SARGENT shows his usual dexterity in his eight portraits, but they cannot be pointed to as ideals for imitation, for the subjects appear too plainly to be imploring admiration. The examples by other artists which will repay attention are numerous, and among the best of those by outsiders are Mr. PEACOCK's *William Holman Hunt* and Mr. OSBORNE's *Mrs. Little FALKNER*. Indeed, this year the number of pictures in all classes which should not be neglected is greater than usual.

#### THE ROYAL ACADEMY BANQUET.

THE banquet of the Academy was held on Saturday evening, May 3rd, at the Marlborough Hotel. Sir Edward J. Poynter, P.R.A., presiding. Two more speeches deserve to be recorded.

The Prince of Wales in his response referred to art in the Colonies and said:—

Speaking before this distinguished company to-night, might perhaps be expected to say something in regard to art in our colonies. Although our stay at the various places was necessarily of short duration, I think we saw enough to realise that with the development of these young but vigorous communities there is a steady growth of artistic knowledge and love of the beautiful. At Sydney, in the National Art Gallery, there are original works of some of our most distinguished modern painters, and you will be interested to hear that among the most popular of them is the picture, *The Queen of Sheba's Visit to Solomon*, painted by your President. There are also upwards of sixty copies of some of the best-known works of the old masters. At Adelaide I visited the Art Gallery, and had the pleasure of unveiling a bust of the late Lord Tennyson, a beautiful specimen of the work of the late Royal Academician Mr. Woolner. I also unveiled a very fine painting by another of your most famous colleagues, namely, *Love and Death*, by Mr. Watts. In Australia during the last few years a system has been introduced for interchanging the finest works in the galleries of the capitals of the different States, and this arrangement has been of great advantage both to the public and the students. And there is another important point which might mention, and that is that the galleries receive State endowment and an annual grant for the purchase of pictures. There are already a considerable number of students in Australia, but I was given to understand that the majority of them complete their studies in Paris. I am sure our friends across the Channel will not accuse me of jealousy if I ask you, Mr. President, whether it would not be possible for our Academy to hold out some special attraction to induce a few more of those students to break their journey in London and to complete their studies here. The splendid Parliamentary buildings of Ottawa and Victoria, British Columbia, are indeed worth examples of architectural design; and, as a rule, the public buildings in the great cities which we visited can be most favourably compared with those of any of the large cities of Europe. We were also particularly struck with the artistic taste displayed in the street decorations and illumination. You will not be surprised to hear that some of the most effective were the work of the Japanese and the Chinese. Last Thursday I had the pleasure of spending some time among the beautiful works of art which adorn these rooms, and I should like to congratulate, if I may be allowed to do so, Sir Edward Poynter and our kind hosts on what, I am sure, will be considered a most successful exhibition. Amongst the many fine portraits which I have seen, I must mention the very striking one of the King by Mr. Luke Fildes. I understand that copies of it are to be made for the Embassies and Government Houses in India and the Colonies, and I am sure that each of the pictures will be very much appreciated by them, not only as great work of art, but also as an excellent likeness of the Sovereign. Once more I beg to thank you most sincerely for the very kind way in which you have received this toast.

The Lord Chief Justice, in proposing "The Royal Academy," expressed the earnest and fervent hope that it may always be an encouragement to the struggling, an ambition to the successful, and an example and a leader in all that is most noble and pure in art.

The President, in reply, said:—I must thank the Lord Chief Justice of England for the kind way in which he has proposed the toast of the Royal Academy, and I can assure him that the first efforts of the Royal Academy are devoted to that of which he spoke in his concluding sentence—the cause of the best form of art and the best form of education in a

the history of the Royal Academy is not of an eventful kind, besides our annually recurring exhibitions the only events of interest to record are those connected with the changes which take place in our body. We have to regret the loss of some of our members who have departed from among us in the years which have passed since the last occasion on which we returned thanks for this toast. Two of these—Mr. Pickers-  
 formerly, before Mr. Calderon's day, keeper of the Academy, who died at a very advanced age, and Mr. John Faed, celebrated as the painter of touching domestic scenes—had been deterred, the one by blindness, the other by advancing age and ill-health, from exhibiting here in their later years. I had long ago retired from their membership. A third Academician, the veteran Sidney Cooper, who but recently died in his ninety-ninth year, was painting with his usual extraordinary energy until within a short time of his death; some of his pictures done since last spring hang now on the walls of our gallery, and in certain qualities for which his pictures were always famous show few traces of the decay which one would expect to find from his extraordinary age. Besides these, the deeply-regretted and premature loss of another of our Academicians—Onslow Ford, who had come to the front rank as a sculptor—makes a gap which will not easily be filled. Philip Morris, one of our Associates, whose pictures gave such high promise at the time of his election, came gradually incapacitated by ill-health from practising his art, and felt obliged to retire from his position as an active member. John Brett, who sprang into fame in the early pre-raphaelite period by the marvellous truth to nature and accuracy of detail in his work, and whose first exhibited picture, *The Stonbreaker*, I saw at the first Academy exhibition which I ever visited, excited a violent controversy by the novelty of his methods, but soon became established as one of the most original of our landscape artists; he was an unconscious example to many who, no doubt, were not aware of the strength of his influence upon themselves. Latterly ill-health obliged him to limit his work and withdraw to the ranks of our retired Associates. His Royal Highness made some very remarkable remarks with reference to students of art in the Australian colonies, who, it appears, are apt to go to Paris to pursue their studies. I should be the last to say anything against this course, for my own art education was mostly acquired in one of the famous studios in Paris. But times are a good deal changed with respect to art education in England. All the most successful of our younger artists have gone through a course of study in the schools of the Royal Academy, and I do believe there are now better schools to be found anywhere than our own. Whether it will be possible to offer special encouragements to colonial students to come here is a matter worthy of consideration; but these schools are open free of expense to all who can pass our examination, and are liberally, sometimes I think too liberally, supplied with prizes and scholarships. Our exhibitions are, of course, the feature of the Institution of most interest to the public. The summer exhibitions are, of course, the gauge of the state of the arts in this country, and I am delighted to find from what His Royal Highness has said, and from the general opinion I have heard expressed, that the present exhibition is considered to be one of rather exceptional quality. The winter exhibitions do not appeal to so wide a class, and it is a matter for regret that the agencies of preparation for our summer exhibitions require that they should be closed just as the public seem to be becoming aware that they are open. The remarkable collection which we had on these walls last winter would have been impossible but for the wonderful liberality which the owners of great collections display in depriving themselves of their choicest works to meet all the demands which, following the example set by the Royal Academy, so many institutions now make upon them. Such a collection of pictures by Claude Lorraine, that great painter who is the founder of the school of pure landscape, has never before been got together; and the almost more interesting collection of his drawings included, with the exception of those in the public museums and the famous *Liber Veritatis*, which is a bound volume, almost all that are to be found in this country. To mention individual lenders and omit others, were all responded so freely to the requests of our committee, that it would be invidious; but the famous Raphael, which was lent by Mr. Pierpont Morgan, together with a beautiful Vandyke, and a special notice and would alone have commanded a great interest for an exhibition. The collection of early English and Flemish paintings showed those schools in their full light, and the whole exhibition was a source of the most valuable instruction to artists and students of art in the great methods of the great schools of painting, and this I take to be the one prime object, not only of our exhibition, but of our national collections, and one to which all others should be secondary. To the numerous proprietors who gave the Royal Academy this opportunity, not only our own thanks, but the thanks of the whole community of artists are due. Coming within the domain of art and of the limits which I have bound to impose on myself on this occasion is the sub-

ject of the preservation of the famous view from Richmond Hill. This view, so perfect in its arrangement of woodland, river and meadow, is like a precious picture which cannot be touched without being marred. It is known how the most perfect part of this unique picture, the central part with its magnificent timber grouped as a Turner might have grouped it in some ideal composition, was threatened, almost doomed to destruction, by the ruthless invasion of the speculative builder, which had gone so far that the felled timber in the rearward part of the doomed estate was lying in rows on the ground; and it was only by the prompt and immediate action of Lord Monkswell in bringing the matter before the London County Council that the process of destruction was arrested. The owner of the estate met Lord Monkswell and myself most willingly and in the most liberal manner, as soon as the matter was put courteously before him and he was no longer assailed by too energetic correspondents to the newspapers, and within twelve hours stopped all proceedings. I will not detain you with what is a long story; but I think I may safely add that, although we are still short of nearly 4,000*l.* towards the purchase-money for the estate, there is little doubt that this exquisite prospect of world-wide fame is saved for ever for the public. There is much more which I could say on many subjects, but at this late hour the interest which they have for me and for the Royal Academy might not meet with the cheerful reciprocation in your minds which I might think they deserved. I will therefore end by thanking you for the very kind attention that you have given to my words.

#### DISCOVERIES OF POTTERY.

IN the course of laying out new golf links at Sunningdale, near Camberley, on the Ridge Mount estate, an interesting discovery has just been made. The contractors decided to remove a mound 10 feet high by 40 feet across in order to make a teeing-off ground, and this being done the mound was found to contain ancient burial urns. The authorities at the Reading Museum were communicated with, and Mr. O. A. Shrubsole, F.G.S., the curator of the Geological and Anthropological Department of that institution, with the assistant curator went over to Sunningdale and found that three urns had been disinterred, and seventeen in all have now been unearthed and removed, all of them containing calcined human bones. In addition the excavators found indications of two interments of ashes not deposited in any urn. The mound is supposed to be the remains of an ancient crematorium. The urns are all of rude British make, and may be ascribed to pre-Roman times. In the absence of any vestige of a weapon or ornaments the exact age of the burials cannot be determined with certainty, but from the shape of the mound, the care evidently exhibited in the disposal of the dead and the evidence of a village community, it is thought that the remains belong to the age of Bronze, and probably to a late rather than an early date in that age—between 2,000 and 6,000 years ago. Some of the urns are 1 foot 4 inches in diameter. The spot has been visited by many archaeologists. Some of the urns have been sent to the British Museum, the Reading Museum, to Oxford and to the Louvre.

During the excavations in the churchyard of St. George the Martyr, Southwark, in connection with the Long Lane street improvement now being carried out by the London County Council, a very interesting discovery has been made. At a depth of about 9 feet some fragments of pottery and of ornamental terra-cotta work were discovered in a heap, as if they had been thrown together promiscuously. The fragments were exhibited at a meeting of the Society of Antiquaries on April 17. Whilst the pottery is Roman, the terra-cotta work, the ornamentation of which is peculiar, dates from the time of Henry VIII., in whose reign the art was introduced into England. Stow says that "almost directly over against St. George's Church was some time a large and most sumptuous house, built by Charles Brandon, late Duke of Suffolk, in the reign of Henry VIII. which was called Suffolk House." From Antony van den Wyngaerde's "View of London," circ. 1550, which contains the only representation of the house known, it appears that the mansion was built in the style of the Early Renaissance, and it therefore seems very probable that the fragments in question had their origin in Suffolk House.

The President of the Local Government Board having considered the dispute between the Metropolitan Asylums Board and the District Railway Company as to the amount to be paid for closing the ventilator on the head office site, has decided that the Board should pay to the railway company the sum of 3,000*l.*, and also such further sum as shall represent the actual cost of the works necessarily executed by the said company in closing the said ventilator.

## NOTES AND COMMENTS.

SIR JOSHUA REYNOLDS in one of his discourses, when recommending that an artist should employ the works of others as daily food and nourishment, quoted the remark, "Serpens nisi serpentem comederit, non fit draco." It is possible, however, that the consumer may never grow into a dragon, but will resemble its victim. In painting, devotion to one master, ancient or modern, is rarely serviceable, although it may be easier to look as it were through the eyes of another than to see for oneself. Dealers and others do not always complain when two men's styles become identical through the adoption of REYNOLDS'S principle, for a close resemblance may be more profitable than a skill in making copies that are mistaken for originals. In France, where there are more varieties of artistic work than with us, the Courts are able to distinguish between legal and illegal imitation. A case was lately heard which gives an idea of French practice. There was a landscape painter named TROUILLEBERT, who in his lifetime had many admirers. Among them was a clerk in a railway office, who in his hours of leisure studied painting and received advice from TROUILLEBERT. At last the devotion was rewarded by the student's success in producing works that were taken by amateurs as coming from the hands of the master. The painter died, and his widow brought the disciple before the Courts on the charge of counterfeiting her late husband's works. According to the counsel for the plaintiff there is counterfeiting whenever an artist, instead of reading in the book of nature which is open to all, usurps the method of treatment, the lines and the colours of another artist. The counsel for the defendant contended that to make copying criminal there must be a fraudulent intention, such as forging the signature or obtaining a photograph of the original and using it for reproduction. The Tribunal adopted the latter view, saying that it was to be expected that a master should have imitators, but unless the imitation was intended to deceive the public as to the personality of the artist rather than suggesting a similar class of work there was no offence committed. M. TROUILLEBERT'S disciple therefore gained the day.

HERODOTUS several times refers to the riches which were found in the Temple of Didyma, adjoining the ancient city of Miletus. It was dedicated to APOLLO. When the Persians, in the reign of DARIUS, invaded the country, they were able by the use of military engines to undermine Miletus and obtain possession of the city. All the Milesians were brought as prisoners to Susa, as well as all the precious objects which were found in the temple at Didyma. In the course of the excavations by the French explorers in Susa a piece of bronze has been found which helps to confirm the words of the Father of History. It weighs about two hundred pounds, and contains five lines of an inscription stating that the bronze had been offered to APOLLO by two Milesians. There can be little doubt that this piece of bronze was taken from the temple as part of the booty. The old historian says that the Pythian oracle declared that Didyma should see its altars transferred to another place, and the prophecy was fulfilled. The calamities of the Milesians must have been unusual even in an age when mercy was unknown, for the Athenians were so moved by a dramatic poem on the destruction of Miletus they fined the author, and would not allow the piece to be repeated.

AMONG the new buildings in Amsterdam there is not one more interesting than the Ryks Museum, with streets surrounding it which commemorate HOBBEEMA, HONTHORST, PAUL POTTER, GERARD DOU, CUYP, JAN STEEN and other artists. The museum was completed seventeen years ago from the design of M. CUYPERS, and a week could profitably be employed in studying the contents of the galleries and courts. On the first floor are the principal pictures, but it has been found that the lighting is not always satisfactory, and from time to time various alterations are made. The most important and costly is one which is now under consideration and will have to be carried out. For the majority of visitors the greatest treasure is REMBRANDT'S

painting, which somehow has obtained the absurd title *Night-Watch*. The room is dedicated to the painter, and a frieze relating to the incidents of his life is round the wall. The light is obtained from above, the roof being supported by figures of the four periods of the day, which stand up marble columns. Soon after the removal of the painting from the Trippenhuys it was found that it appeared to be less effective. Several artists expressed the opinion that the roof-light was unfavourable to it. In order that the question should be investigated most carefully, a commission consisting of twenty-four painters was appointed. They made various experiments, and at last they were aided unexpectedly towards a conclusion. Four years ago an exhibition of REMBRANDT'S works was held, and the *Night-Watch* was removed from its position in the Ryks Museum to the municipal museum, where it was illuminated by side-light. The advantage was immediately evident. The commission accordingly were able to report in favour of an alteration. It has been decided, that the wall in the Rembrandt room on which the picture hangs is to be taken down, and a recess formed with a south-western light. This will contain the painting. The cost of the alteration will be over 6,000*l.*, but the Dutch Parliament will not shrink from the outlay if more justice can be done to their great inheritance.

MANY of our readers may not be aware of the existence of the London Topographical Society, although it is forty years in existence. It has for its object "the publication of maps, views and plans of different periods, and of all parts of the City and County of London, and the publication of documents and data of all kinds illustrating the history of London in every department." The annual record which has just been published contains papers and addresses which will suggest how far the committee have been able to carry out the intentions of the founders. Mr. NORMAN F.S.A., describes the fragments of the Mediæval building found in St. Andrew's Hill, between Ludgate Hill and Blackfriars, a couple of years ago. He considers that it remains formed part of an oriented crypt or undercroft of the thirteenth century. The changes made in connection with the Strand improvement are dealt with. There is an interesting reproduction of a plan by WREN, dated April 10, 1677, showing premises at Whitehall which were granted to Sir WALTER ST. JOHN and others. Although drawn to scale, WREN is careful to write the dimensions of the ground, which were 140 feet in length northward and 85 feet in length westward. A copy is given of a view of the Strand at the time of the royal procession to St. Paul by Queen ANNE in 1713. There are also illustrations of the Strand and neighbourhood prior to the recent demolitions. The publications of the Society consist of views of London by WYNGAERDE and VISSCHER, made by HOEFNAGEL, PORTER, NORDEN, the latest being a plan of the road between Hyde Park Corner and Addison Road, made for the Kensington Turnpike Trustees by JOSEPH SALWAY in 1811. A plan of Whitehall has been prepared by Sir JOHN TAYLOR, showing the alterations since 1682. It is also proposed to publish a map of London in the reign of Queen ELIZABETH, attributed to RALPH AGGAS; KIP'S prospect of London and Westminster in 1710, and two views of London by HOLLER. An organisation like that of the Society has been long needed, for so many transformations are in progress and contemplated, Victorian London may soon be expected to survive only in detached parts. It is therefore well to have trustworthy records of the streets before they have vanished.

# ROYAL INSTITUTE OF BRITISH ARCHITECTS.

The annual general meeting of the Institute of Architects was held on Monday evening last.

## Royal Gold Medal.

On the motion of the Chairman it was agreed, "That, in respect to His Majesty's gracious sanction, the Royal gold medal for the promotion of architecture be presented this year to Mr. Thomas Edward Colcutt for his work as an architect." The Royal gold medal was not awarded last year owing to the death of Queen Victoria. This year Mr. J. F. Bentley, the Council's nominee, died two days before the date appointed for election. The Council, having consulted the King's Privy Council, were unable to recommend the general body of the Institute to present the medal to Mr. Bentley's family, and therefore nominated Mr. T. E. Colcutt.

The report of the Council for the official year 1901-2, after dealing with the removals by death, expressed deep regret at the loss of their old and valued colleagues James Brooks, Arthur Cates, and J. M. Brydon. To Arthur Cates the Institute owed the present development of the examination scheme. James Brooks was always a wise counsellor and loyal friend. J. M. Brydon, taken away in the midst of his work for the Institute as president, and in the early tide of his fame as an architect, before he could see one stone of his life's principal work laid upon another, would always be a memorable and heroic figure.

The present subscribing membership of the Institute is made up as follows:—Fellows, 617; Associates, 1,071; Honorary Members, 44; total, 1,732. During the official year since the last annual general meeting twenty-five Fellows have been elected and seventy Associates. Three hon. Corr. Members have been elected:—Marie Perrin (Lyons), Enrique Mariá Repulles y Vargas (Madrid), M. Alberto de Palacio (Madrid). The usual preliminary examinations were held in June and November 1901. In the last year, there was a steady increase in the number of candidates for each of the examinations. There were eight candidates for the "special" examination for architects in the year over twenty-five years of age and chief assistants over 25, of whom seven passed. The total number of candidates entered during the year was 674, as against 603 in 1900. The number of probationers of the Institute now stands at 100, and of students at 402.

Owing to the death of the donor there were no Arthur Cates prizes available for award as a result of the examinations in 1901. But now the Council, having invested the sum of £10,000 bequeathed by Mr. Cates to the Institute for the purpose of endowing a prize to bear his name, have instituted the prize, the conditions as nearly as possible on the lines laid down by Mr. Cates for the prizes he awarded during his lifetime.

The sum of £1,000 has been invested in Indian Government securities as the nucleus of a building fund, which will be allowed to accumulate practically at compound interest. Without this fund at the present moment, when no specific building scheme is before them, to open a formal subscription list, the Council will beg leave to draw the attention of members to this fund, to the increase of which they would be very glad to receive any donations. The movement towards obtaining new premises has, however, gone so far as this:—A joint committee of the Council of the Institute and the committee of the Architectural Association have met and have reported that it is desirable for the two organisations to combine in one building scheme. The Council have approved this report, and have agreed that while it was desirable that they should occupy one site and have some of the accommodation in common, yet the respective premises should be to all intents and purposes separate buildings.

A rough estimate has shown that the requirements of the Institute will need some 10,000 feet super, and those of the Architectural Association 5,000 feet super. The Council will receive information as to available sites from members. The present premises are leased to the Institute until March 24, but the lease can be determined at Midsummer 1904 by giving six calendar months' notice. The report of the art standing committee stated that, although the whole of their suggestions with regard to London premises were not adopted, modifications in the design had been made on the lines they recommended. As to the decorations of Paul's Cathedral, a letter was written to the Dean of Paul's asking that the designs of the proposed decoration of the drum of the dome might be publicly exhibited before the Council had proceeded with. An acknowledgment of the letter was received, but it unfortunately contained no undertaking that there should be any exhibition of designs.

The following statutory Board of Examiners were appointed for the ensuing year:—Messrs. Lacy W. Ridge, J. Douglass, W. H. Hunt, R. P. Notley, Professor Roger Smith, H. D. Wood, B. Tabberer, T. H. Watson, W. Grellier, W. E.

Clifton, F. E. Eales, F. Hammond. Messrs. James Glen Sivewright-Gibson and Henry William Chatters were elected Fellows, and Alfred Arthur Hudson, barrister, hon. Associate.

The following clauses of the existing form of building contract which have been modified by the practice standing committee to adapt them to the new purpose were agreed to:—

1. The works shall be carried out in accordance with the directions and to the reasonable satisfaction of the architect, in accordance with the said drawings and specification and bills of quantities, and in accordance with such further drawings, details and instructions in explanation of the same as may from time to time be given by the architect. . . . The contract drawings and specification and the priced bills of quantities shall remain in the custody of the architect, and shall be produced by him at his office as and when required by the employer or by the contractor.

3. The contractor shall on the signing hereof furnish the architect with the fully-priced bills of quantities for his use or that of the surveyor appointed as in Clause 13 hereof, and for the purposes only of this contract.

Clause 13—The penultimate sentence to read:—

The variations shall be valued at the rates contained in the priced bills of quantities, or where the same may not apply, at rates proportionate to the prices therein contained.

27. The words "prime cost" or the initials P.C. applied in the specification and bills of quantities to goods to be obtained and fixed by the contractor shall mean, unless otherwise stated in the specification or bills of quantities, the sum paid to the merchant after deducting all trade discount for such goods in the ordinary course of delivery, but not deducting discount for cash, and such sum shall be exclusive of special carriage, the cost of fixing and contractor's profit.

28. The commencement of the clause to read:—

The provisional sums mentioned in the specification and bills of quantities for materials to be supplied or for work to be performed by special artists or tradesmen, &c.

## MALMESBURY ABBEY.

A MEETING in aid of the effort to raise funds for continuing the restoration of the Abbey Church of Malmesbury was held recently in the chapter-house of Bristol Cathedral, the Lord Bishop of Bristol presiding. Funds are urgently needed in support of the effort now being made to preserve this grand and historic building. Only the work actually necessary to effect this object is now being attempted. The work, which was commenced in 1899, is entrusted to Mr. Harold Brakspear, F.S.A., and the contractors are Messrs. Hayward & Wooster, of Bath. The work already done comprises the rebuilding of some of the flying buttresses over the aisles which threatened to fall, the reinstating the destroyed upper parts of their counterbalancing pinnacles, the parapets of the north side, and the renewal of the perished stonework generally, the relaying of all the windows and the renewal of all the gutters and down-pipes, relaying the aisle roofs and making all the roofs watertight. The necessary drainage has also been thoroughly done, and a concrete surface gutter put round the walls. In addition to these works, the missing pillar at the west end of the nave on the south side has been replaced, together with the main arches, triforium and clerestory above, as being the best means of giving the necessary support to the south-west corner of the present church, the state of which threatened ruin to the noble south porch. In planning this new work the main lines of the ancient design have been followed; but full care has been taken to show that it is modern, and to prevent misconception as to its date in the future. For the purpose of continuing the work at the west end it is necessary to enter into a contract entailing an expenditure of about £1,300.

His Lordship said he thought they were quite entitled to say that there were few places in England which could compete with Malmesbury for interest in the earliest times of the Church of England. They associated that great interest chiefly with the name of St. Aldhelm, and the English Church had recognised his importance by putting his day next to the days of two persons whom they always named as of primary importance in their earliest Church history. St. Aldhelm's Day was May 25, St. Augustine's May 26, and the Venerable Bede's May 27. That was a very interesting collocation, for Aldhelm really combined the work of Augustine of Canterbury and Bede of Jarrow—that was to say, he was a great ecclesiastical writer and a great prelate. Malmesbury itself dated its surpassing interest from times before St. Aldhelm. The first time it appeared in the history of the English Church was, he thought, at the time of the interview between Augustine and the Britons, which a former generation used to put at Aust-on-the-Severn, but which he thought all Church historians were now agreed must have taken place near Cricklade. By "all Church historians" he meant all persons who had recently published important works on early English Church history;

he did not at all mean that all archæologists were agreed about it. And the reason why it had anything to do with that was because the British Church was at that time surviving in complete fulness at Malmesbury, and it was not until fifty years after that that the West Saxons isolated Malmesbury as a great British fortress by cutting through the forest of Selwood at Bradford-on-Avon. Then the West Saxon people had become Christian, and so when Malmesbury did fall into their hands the Britons were not massacred. There was no upsetting of their religion at all; the Christian religion went on unbroken in Malmesbury. There were very few, if any, places of which that could be said to be true. There was a very interesting fact with regard to that remaining to the present day. He had said that the Britons remained there undisturbed. Well, if they would look in the scientific accounts of the various skulls of persons in different parts of the kingdom they would find that Malmesbury was singled out as a place where the ancient British skull was remarkably prevalent in the present day, the skull on the average being just the same as the skulls found on Salisbury Plain, the skulls of the prehistoric persons who built Stonehenge, and places of that kind. That was a very unusual proof of unbroken continuity. As soon as the West Saxons got hold of Malmesbury they continued the school under an Irish teacher, which had been going on, and Aldhelm, a cousin of the king, was sent there to be educated, and in the course of time he rose to be Abbot of Malmesbury, 670 or 672. At the division of the great diocese of Wessex, which took place thirty years after that, they chose two Malmesbury persons to divide between them the whole of the great diocese of Wessex. Aldhelm the abbot was made bishop of five-sevenths of the whole, and Daniel, a monk of Malmesbury, bishop of the remaining two-sevenths. So Aldhelm was bishop among other parts of Wilts—the north part of which was now in the diocese of Bristol; also of the whole county of Dorset, the whole of which was in the diocese of Bristol until 1836; also the whole of Somerset—the parts of the north of which had always been in the diocese of Bristol since it was a diocese. Bristol thus had a very close tie with St Aldhelm, and when he (the Bishop) had to find a name for the first mission church built in his time on that side of the Avon, he had it dedicated to St. Aldhelm. Now under Aldhelm Malmesbury became one of the finest schools in the kingdom. It was Aldhelm's principle that it ought not to be necessary for English people to go abroad to be educated in the highest knowledge, the fashion in those days being for English Churchmen—there not being the best and highest teaching in England itself as yet—to go across to Ireland, where ecclesiastical study was very complete indeed, and where people were very learned. Aldhelm withstood that, and provided at Malmesbury the complete teaching which English people required, whether for lay or clerical work. That was an important point. Also, he told them himself he was the first of the English race to study Latin meters, and that Malmesbury was the first school in England where the Latin language was taught completely by a person of the English race. He could go on piling up the interests of Malmesbury. King Alfred was specially devoted to Aldhelm and to Malmesbury. He brought over a very learned Scot to restore the learning of Aldhelm's time, which under the Danes had perished, and of Aldhelm himself he said no country had ever had such an abbot as he was, for he could both write a poem and he could compose a musical air to which it was set, and he could himself sing his poem to his air. He also told them he had remarkable skill with the harp. And William of Malmesbury, who lived after the year 1100, told them the street songs, which were still sung about the streets in the vernacular Anglo-Saxon, were composed by Aldhelm all those hundreds of years before. It did not fall to many men of modern times to write street songs which the people were singing 440 years after the author ceased to be. He might add that Dunstan thought more of Malmesbury than of any place, except his own Glastonbury, and made an organ for Malmesbury and gave it to Malmesbury. The place was interesting on another account—the land of Malmesbury was still held by the commoners on the tenure created by the gift of Athelstan. He had seen a statement in a judgment that it was the oldest tenure they could trace. Whether that was so he was not prepared to say. Just one more fact. When, before the Conquest, it was proposed to recombine the sees of Wilts and Dorset and so on, the bishop who was appointed determined that Malmesbury must be the place. It was the one place in the west part of Wessex fitted for a bishopric. He got the assent of Edward the Confessor; but Earl Godwin opposed it and got it stopped, and the thing fell through. Later on the same bishop was made bishop of the other half, and then the time really came when the two could be put together and put in the most prominent place in the whole of West Wessex. Again Malmesbury was chosen. This time Queen Edith was in favour of it, and also the king, and they both assented; but again, Godwin being dead, Harold got that stopped for local reasons. So, as he was always glad to tell his friends at Salis-

bury, the unfortunate people had to go to a poor second place because they were not allowed to have the one supreme place in the whole of West Wessex—Malmesbury—for a bishopric. But for this opposition he had alluded to the see of Salisbury would have been the greater see of Malmesbury. Besides this, at Malmesbury was reared the man who was always called, and certainly deserved to be called father of English history—William of Malmesbury, whose writings were read with quite as much avidity in these days as those who could read them in the original as Green's "History of the English People," and were quite as interesting, and in all respects, for the time, quite as accurate. He was a very man indeed, and was reared and trained and lived and died at Malmesbury. So they saw St Aldhelm and St. Augustin and St. Dunstan, the three greatest names they could mention many respects, were all specially connected with Malmesbury, and they, curiously enough, were the only three Englishmen who, according to the Use of Sarum, were—their feasts were observed with "ruling of the choir." He did not think they needed labour further the point of the extreme importance of Malmesbury, not only to the diocese of Bristol, but to the English Church at large, and the claims were very high indeed. Now, with regard to the building itself, which the present generation had in charge. He maintained that the present generation had in charge the reputation of this great building. Leyland, in Henry VIII's time, had to visit the places where there were famous libraries, and report to Henry what the contents of the libraries were. In that official capacity he went to Malmesbury, which stood very high among the libraries of the kingdom of that period. Leland said of Malmesbury an abbey church and building, "a right magnificent thing, it must have been very true, although in his time the prominent part of it had fallen. He was always glad to see before the dissolution of monasteries the great ruin of the part came. There was an enormous central tower—a Norman central tower, two arches of which still remained—one that was free and open, one of the most striking things they could see in architecture. At the top of the enormous Norman tower there was a great pyramid, or so elevated that the two put together were 21 feet higher than Salisbury, and instead of standing low down by a river the building stood high up on an eminence. Even the nave remained was a striking object standing up against the sky when approaching it from the north, but when there were towers and spire on the top of that the whole world around there could not help seeing. The nave was of nine Norman bays; then there came transepts; then there was a central tower; then the presbytery of five bays—the church as they would call it now—and then behind that the chapel, and the total length was 332 feet. Except the nave only remained. That was 148 feet by 68 feet, and the bays towards the east were complete, and three bays were roofless. The west front was a very magnificent thing which was 90 feet broad. The whole of the north side of the front was broken away—it was said it fell when the canons were fired for the restoration of Charles II.—and they only the south half of the west front. It was in rather a ruinous condition, that spoiled its effect and beauty, but they straightened it up and make some improvements and alterations there, and that was what they were now desiring to do. There was a porch, which was certainly second to none in the kingdom. It and the porch of the sister church were also Aldhelm. Those were the only two porches which could be mentioned; all others must be mentioned in a different breath. That south porch was one of his chief anxieties when he became Bishop of Bristol, because the whole of it was perilously near falling, and the first fall would have come where the porch was. The porch was quite worth going over from Bristol to see if it were nothing else. There were seventy subjects carved in thirty-eight were on the vousoirs of the arches. Those were from the Old and New Testaments, and thirty-two were on the piers in ovals, such things as the signs of the Zodiac and the operations of the various seasons, the same sort of things they would see in those wonderful capitals at Carlisle. It was an interesting thing that they had a description of those subjects in two very dissimilar places—first, the very unscientific account of a tourist in 1634, who, he must say, made wonderful shots at the subject; and then Mr. Cockerell's famous account in his book on the sculptures of Wells Cathedral. The date of the building of the Norman church there was from 1130 to 1160—a most interesting period of Norman architecture—it was slightly modified and moving on to the architecture of the thirteenth century. The clerestory of the nave was done soon after 1300, and at that time a stone vaulting was put on the roof. This, of course, caused a lateral thrust which the walls had not been prepared for, and that was the reason why the striking flying buttresses were thrown across the roof of the aisles, with counterbalancing pinnacles over the aisle windows, giving a wonderfully picturesque air to the whole building, and giving a grave anxiety to the custodians of the building.

thankful to say those were done. Every one that needed down and rebuilding had been taken down and rebuilt. The upper surfaces of those that were not so bad as that had been made good, and the broken counterbalancing pinnacles had been repaired, so that the whole thing now, he was glad to say, was as trim and square and right as it could be. Another great work that they had done had been to shore up the west front of the present six bays, and that had been done in the very happiest manner, he thought, possible. In the building of a great ugly buttress, they had simply put the parts of the Norman piers, both on the ground and so to speak, and on the triforium; and on the other side they had simply replaced the pillars that were there, and so had caught the projecting half-arches at the storeys where the liability was to fall, and had met and entered the pressure by making the arcade of three perfect and complete. It was an exceedingly happy thing that it had cost less money than building any other buttress would have cost; it was beautifully slightly of being horribly unsightly; and if at any time it was to complete the church, and have the three western bays built, not one sixpence of what they had spent on this could be thrown away. If they had built a buttress, nothing of the expense would have been thrown away, the buttress would have had to be removed. He thought that was quite an ideal way of dealing with a building in description, and he might say that all through, wherever they had replaced, they had left the moulding entirely uncut, so that one could ever say, if the thing stood 1,000 years—no one could ever be taken in to believe that the work they had done in the last two or three years formed part of the original work. They could not deceive anybody. Even if they were proposing to continue the cresting of the pinnacles, though for the satisfaction of the eye the whole was run in a straight line, he had so arranged that the work should be quite different. The ordinary eye would not notice the difference, but anyone who understood architecture would be able to say up to that precise point the old work and the rest might look as old as they liked, but the cusping was different. Great care was taken to have no vandalism and no mutilation. They had spent on this work about 3,600*l.*—a large sum if they knew the circumstances of Malmesbury, still a larger sum if they knew by what serious efforts it had been raised. They wanted 1,200*l.* The circulars sent out showed how much they had done besides what he had added to them. They had acted so cautiously that they had left the whole of their liabilities and still have something in hand, and they were hoping that now they might get some subscription in Bristol, and show that they had done it with this work.

The Dean of Bristol expressed the hope that there would be no difficulty in obtaining the funds required for the work.

## STREET ARCHITECTURE.\*

The street architecture of England can only refer nowadays to the combined effect of the many various and unrelated buildings in our streets. We have no proper street architecture in the sense in which we may be said to have a domestic or ecclesiastical architecture of recognisable quality, possessing certain characteristics born of tradition and new movement. A broader description of civil architecture, including within it the buildings of municipal or semi-public character, will be far more materially our estimate, or permit us to claim for our cities an architecture which we could in any general sense call coherent, traditional or worthily characteristic of national taste and refinement.

Our street architecture, such as it is, cannot help being representative of its producers, and of their ideals or lack of them, and as there is neither lack of enterprise nor self-esteem among us, particularly in the life of our street-building cities, consideration of the external environments of this busy side may assist us in endeavouring to review the causes and effects of our lack of a street architecture, which should rank at least at our dwelling-houses and churches, and direct us to the means which may stimulate desires for improvement, and should ensue upon the consideration of a condition which has been led to admit is unsatisfactory.

### Comparison with Domestic and Ecclesiastical Architecture.

We have premised that our ecclesiastical and domestic architecture has life and artistic value, for any review of the Victorian era exhibits a revival from mere formalism and application of types to vital influences of artistic opinion to purpose with a pleasant reflection of the eclectic of the traditional architecture of England. Education,

culture, refinement and literary taste are evident in the whole movement of the building arts and crafts during this period. The churches of the latter half of the nineteenth century, arranged chronologically and illustrated internally and externally, would present a gallery of architectural designs of amazing versatility and originality, and of quite wonderful beauty, of picturesque dignity and charm of detail, rich in genuine beauty of workmanship and conception.

A similar result will be arrived at, with the exercise of some greater selection in the earlier period, by assembling an exhibition of English houses of all sizes, the homes indeed of the people of a profound peace and of unparalleled domestic prosperity and development. Stately or modest, romantic or homely, the same originality of conception, wide comfortableness, reasonableness and perception of the beauty of domestic life will be generally apparent, while in the details of decoration and furniture, artistic impulse and architectural character have led to a real revival of the handicrafts, and endeavours to make the commonest utensils of home life beautiful to eye and hand, ennobling alike the designer and the user.

It may be remarked incidentally that the manifested vitality of this English architecture has met with recognition at the hands of continental critics, and that in ecclesiastical and domestic art we have an admitted mastery that has produced energetic followers and admirers in different directions.

It must be observed that the two branches of building art upon which we are touching have originated in one class of society, and in very many ways reflect its social conditions and ideals.

The same upper and upper middle class have provided the examples alike of church and house building, and the movements of thought expressed in this architecture are of the refined education and literary taste, let us say, of those who have derived their ideal and sense of culture from university life, and from opportunities of historical study. The breadth of view and freedom of thought, the criticism and eclecticism of the passing day are present in its architecture as in its literature, for all who can read the characters employed in their expression; an easy illustration of this can be offered in the sustained devotion to Mediæval tradition both of the architect and of the ecclesiastic. In all the work of this representative class there is the characteristic of a powerful craving for a sense of style, a self-consciousness foreign to real Gothic art, but as current in the buildings as upon the lips of client and architect, and with this a strong personal note of individualism and independence which, by persistent differentiation both of example and type, have made the architects men who seek for originality without creative matter, and for conformity to style without the opportunity of realising that environment of characteristics upon which completeness of artistic style depends.

The sense of refinement in this architecture has become so much a characteristic quality to be sought for, marked down and expressed, that native simplicity has become replaced by a laborious affectation which has danger in its artificiality, though its note of revolt against the tendency of the world at large to vulgar elaboration of effect is of great value.

### Street Architecture, Commercial.

As our subject is not the consideration of civil architecture, we exclude public buildings, although they form part of many street perspectives, and with some reservations, cannot consider at any length the dwelling-house of the modern street—such streets of dwellings usually described as “parks” or “gardens,” which might suffer in reputation by a more sincere classification—leaving for our discussion the buildings that compose the business quarters or centres of our cities, which may be safely defined as those of the commercial world, wholesale, retail, warehouse, store and shop, together with their necessary manufacturers’, companies’ and insurance offices, banks and accommodation for the professional men who are essential to business life. It is, therefore, the business community which is mainly responsible for, and indeed originate our street architecture, for whose wants it is designed, and by whose ideals it is controlled. This commercial class is the backbone of our national life and prosperity, and upon it depends that measure of wealth without which architecture, as at present practised, could not exist. It has represented until now the pre-eminence of England, and we shall expect to discover, if we have time for analysis and search in its architecture, so much of this part of the secret of England’s greatness as is capable of translation into the terms stone and brickwork expression.

Comparing the architecture of the ecclesiastic and of the country gentleman with that of the business man, we would naturally anticipate finding that the predominating tastes of the one are sentimental and of the other practical or unsentimental. Art is so wholly a matter of sentiment—we might almost say it is pure sentiment of high and noble character, and architecture therefore largely, though not wholly so—that we might without surprise discover that the street

\* Paper by Prof. Beresford Pite, F.R.I.B.A., read at the meeting of the Applied Art Section of the Society of Arts on April 8.

building of our commercial centres was entirely unsentimental, and architectural only in being wisely and designedly practical.

If we could plant a Utopia where, as a condition precedent of existence, subsistence was provided independently of the exercise or practice of art, we would devoutly wish the consummation that buildings only partaking of sentimental character should be designed by architects, and the streets devoted to unsentimental commercialism and its dependents erected by mere surveyors. That these would be ideally beautiful architecture in so far as they were soundly built and truly adapted to purpose without the affectation of sentimental art I for my own part sincerely believe. The practical business man, however, takes the world as he finds it and conforms his labours to his requirements, and we, admiring the truly practical when it is practically true, must accept the street architecture of commercial purposes as it is, and suit our labours to its peculiarities.

The world, as observed by the keen eye of commerce, has a love of beauty—that is, of colour, of variety, of ornament. The Manchester print finds the best market in Africa if gorgeous, and ordinary articles of household use from smallest to greatest sell better if ornamented, just as they sell better if cheap; in fact, it is to be observed that cheaper articles can be obtained having more ornament upon them than costly ones, cheapness and beauty of the commercial sort going hand in hand, what is intrinsically better being extrinsically worse—that is, deemed less worthy of decoration. The commercial world is at present so—its relation to true art anomalous and contradictory; but we hope yet under some preliminary pulsations of conscience upon the subject, at all events in the home market, though radically wrong in its conception of art as such. Art exists practically, and it is therefore grasped by the commercial hand; but its character changes in the touch from a pure sentiment to an advertisement, and in this very different aspect we meet it in our street architecture.

#### *Good Design Compatible with Requirements and Modern Materials.*

It may be well before going further to emphasise the necessary doctrine that good building design, that is, good architecture, is not incompatible with the best adaptation to use, convenience and healthiness of arrangement. No definition of architecture should be allowed that would limit, in the presumed interests of art, for instance, all the access of light that business premises demand, either in the size or position of windows. Should it be necessary to have the entire frontage of a building occupied with window surface, so far as the limit of the law allows, an architect would assume an entirely false standpoint should he declare that this purpose is contrary to art, though if he decides it necessary to limit the openings by constructive considerations he would be unquestionably within the sphere of his proper authority. Even architectural proportion—that subtle and almost indefinable quality of adjustment which gives pleasure—is itself based upon factors of service. For example, the apparently good proportion of a column depends upon a recognition of the substance of its material, for a well-proportioned wooden column would almost certainly become unsatisfactory, of the same proportions erected of stone or brick. The traditional conventions of the so-called orders of Classic architecture had their origin in the refined adaptation of supports to spaces owing to the necessary limitations of length and depth in the stone lintels which connected the columns. There is nothing radically inimical to satisfactory architectural proportion in any necessary acceptance of the large spaces requisite, and recognised as essential, for the window surfaces of shops or showrooms in warehouses upon the street fronts of the buildings.

The frank acceptance of the most serviceable and convenient materials for the peculiar requirements of commercial buildings is not under any circumstances to be avoided as inartistic. In a public building of a quasi-monumental character and of varying use stone columns or arcades would have an architectural value and suggestiveness both in their forms and material. Association and tradition have in such cases much to borrow from ancient historic precedents, and a sheer modernism of idea would probably be alien in spirit to the *genius loci* and associations of the building. But in business architecture the converse is more usually the case, the commercial world can only in rare instances maintain ancient forms or style; the movement in trade of all kinds is to the newest and latest style, and the pressure of the time not only in economy of production, but in rapidity of distribution, is felt in every direction.

The employment of iron and steel fireproof construction for supports and lintels in the front as well as in the interior, the use of large sheets of plate-glass, and the carrying of great masses and weights upon narrow steel stanchions are instances of special treatment, for which a pedantic architecture will not succeed in discovering conformable types in antiquity, though the same principles of truth, to which pedantry is blind, are to be observed if sought for in all genuine architectural forms. A progressive and living art of building has everything to gain

from any new or increased suitability of its materials to its ultimate uses of the building.

We must assume that there is as much honest picturesqueness of true character about a modern warehouse front of iron and plate-glass as in the timber-framed construction of leaded-quarried glazings of its ancestor of the Elizabethan period, then newly erected for the developing woollen trade in England, and similarly occupying whole surfaces of frontage with small quarried glazed windows and a multiplicity of subdivisions necessitated by the overhanging construction—a contrivance designed to increase floor space on a limited site.

The advent of an employment of rolled iron joists in building art, with a latter development of complete framed construction, marks an era upon the threshold of which we now stand. The significance of this new building may be estimated perhaps by reference to the astonishing high buildings of the United States. No architectural history can compare in importance with development since the rediscovery and application of the use of buildings of magnitude by Brunelleschi and Michelangelo at the Renaissance. That sudden and amazing stride into a new domain of construction when building art appeared to have exhausted its own development, is alike in extent and application to the almost spontaneous generation of high buildings in America. The purposes and authors of this class and of the other contrast picturesquely and characteristically enough the evolution of conscious building art, cultivated by lofty ambition to do service to the universal ecclesiastical State policy of Christendom on the one hand, and on the other the indomitable persistency of invention, stimulated and sustained to all utmost developments by the commercial enterprise of a continent of seemingly exhaustless resources. Compare Michelangelo with the "Soaring Bird of Freedom." In our old country, however, the soaring qualities of steel-frame construction are limited by considerations which we need not discuss, for among the advantages of living in a city of tall buildings, world are to be counted an equitable right to the access of light and air within one's building, and in narrow streets involves a limitation of nearly everybody else's right to street building materials, and as the general sanitary condition of the street are affected by the preservation of sunshine, and this has become one of the many cares of "our excellent grandmother."

#### *The Architecture of Iron Construction.*

Iron and steelwork have, however, entered so fully into the marrow of the building construction of our street architecture that walls properly so called are now few, generally the narrow pair of party structures only, the remainder consisting of panels of brick or stone material filled into the framing of metalwork, while the floors themselves have in all important premises ceased to be of wood, and are of iron filled in concrete or terra-cotta. The main problem of all construction—that of the distribution and carrying of weights—is most profoundly affected by steel construction. The section area required in the supports is so limited and the space between the bearing girders so great that the traditional proportions based upon wooden beams and stone arches, which have become almost a second sense of mankind universal, have ceased to be of any value. The change of this essential fundamental factor of constructive proportion must reconceive the visible expression and meaning of the symbols derived from the stone and wooden architecture of the past. The symbols exist in the mouldings, cornices, architraves, capitals and bases and detail of the architectural ordinances of the various so-called styles. The modern architect should emerge from his museum of palæolithic implements and enter upon the age of commercial architecture with a good heart and a new enterprise. The new factors of proportion are as valuable as those that have passed away, and there is the universal sense of what is just and true to insure the appreciation of intellectual motive, and is not itself the sense of the beautiful in architecture? The new "half steel" has exactly the same claim to be interesting first and beautiful afterwards, as its exact forerunner, the "half timber," and it should be studied and applied the same principles of expressive characterisation of its constructive facts. The rivet heads, stiffeners and knees of the iron girder and stanchion work are similar elements to the oak beam bracings and bracketings of our charming old English farmhouse. That has passed away with the sweet forests of Robin Hood, this remains with the black country of the smelting furnace and coal mine, but is as real and more real to us, as true in its use and as noble in service if looked at straightly without the pseudo-Medieval squint of a false æstheticism.

Again, the old English frontispieces are charming to us because, may be, the glazing is all of little pieces connected together by leaden strips, and our modern English warehouses are disagreeable and inartistic, because the glazing is of one more suitable and perfect material of the plate-glass of modern times.

This is an anachronism which illustrates the conflict between current artistic ideas and common sense that has so malevolent an effect upon our business-house architecture. The steel joist and stanchion not only have their principal the general internal construction of modern city buildings concern our subject mainly in their appearance, or we should say non-appearance, upon the street front. The aid the shop window is enabled to extend itself across the site, an advantage the commercial man cannot be to sacrifice for any architectural fancy of the necessity for support for superstructure. It is of no matter to him the architect does with the girder so long as he provides the window space for the exhibition of wares. Its uses are very many, as it dispenses with arches, the weights of which are carried by it with certainty to the floor joists easily, and is so constructed and fixed that the poor architect has to be and accept it. He, however, endeavours to satisfy his conscience with delusions by masking the objectionable stonework and resigning all criticism of the lower beginning his own conception above it. But the iron dogs the artist's steps still, and in window lintels and supports the value and economy of metal over stone and wood less; the wide windows high up to the ceiling and low the floor, perforce, must be spanned too by girders, as so little room for rising arches or other means of construction, and these girders again are covered over with more delicate stone mouldings attached and pinned to the line in an indescribably unconstructive manner. Few have as yet had the courage to work out an iron structure, say with glazed brick, terra-cotta, stone or concrete. There have been stimulating experiments, but the effort of departure from the well-worn conventions of architecture design is apparently too great for the generality of architecture practitioners.

#### Modernism in Design.

The architect may find some difficulty in adapting his taste and his sentiments to business judgment, but ere the sounder ideal of modern common sense in these will be found as enjoyable as that of an old England at the best unreal and imitative, and however charming possible in the circles of ecclesiastical and domestic architecture in the sphere of modern progressive commercial building. The meeting of architectural art and business will not be found upon any ground of compromise that which is ancient and modern, or between that ideal and practical, but in such a practical employment-modern conditions as will lead the way to further usefulness and appropriateness in building.

The whole-hearted acceptance of the doctrine of a frank employment of design and construction in business premises by is sufficient requirement to make of them for the present and growth in our midst of healthy street architecture expressing the movement of the age in its requirements, rejecting the intellectual attitude of trained and artistic applied to a commercial problem in building. The and stupid antipathy that is supposed to exist between the requirements and artistic character should thus, in architecture, cease to be professed, and having the attitude of art to business life we can the more and successfully hope for and attempt the resuscitation once existed in pure and noble beauty, of living art in the commercial world.

The employment of modern materials and the joyful acceptance of current requirements as a means of expressing a pro-architecture will, however, bring the architect into with other ideals than those merely of archaeological or of an antique style, as serious problems in the early all as yet practically unsolved, await him. The upper floors have to be designed over and upon a ground-floor shop, the front part of which occupies all the space between the ends of the boundary or party walls on the one side and the street on the other. It may be taken as a canon of architecture that buildings not only be of a construction that is secure in itself, but be obviously so, for a building, however scientifically constructed, will not be architecturally satisfactory to the eye and will not be safe. Doubtless time is a great conqueror in matters of artistic criticism, and if a sufficient number of examples of a novel method of construction were to be presented to the world to manifest to it that what is apparently perhaps hung upon nothing, is after all perfectly secure, it would be satisfied, in spite of itself, by the relation of the thing to judgment, and the disappearance of that distrust which is a gift of Providence to save men from their experiments.

#### The Shop Window.

It could therefore have become accustomed by this time to great and massive erections of weighty stone and

brickwork poised upon the slender brass pillarettes, lace-like arches, plate-glass fittings and mahogany fascias of shop fronts, but we are, I am sure, suffering artistic discomfort and deriving no pleasure from their carved and ornamental blandishments, owing to the initial hiatus that the system of architectural design employed demands a basement and obvious foundation, and has none. With this difficulty the modern architect wrestles ineffectually; the implements of his trade were all made for buildings with bases, and he knows not how with them to fashion a modern design without obvious support. This difficulty is everywhere self-confessed, and has caused an infinity of interesting and sometimes amusing expedients. The projection of the shop front beyond the general face of the upper storeys of the front, thrown out so to speak as a screen beyond it, is a device only very partially successful; it has a certain sufficiency when the shutters are down, but modern progress is depriving the shop architect of this scrappy resource for architectural effect at close times, and on Bank and half-holidays. The void is there, gaping all the week, with perhaps the flimsiest draperies depending from the ceiling within it, dispelling all illusion as to supporting a very mine of weight overhead. The emphasising of the end piers which mask the party wall ends with the development of a cornice with the shop fascia connecting them to form a horizontal bridge, on which the upper part is carried, is frequent. This should be a more satisfactory method, as it would disregard the shop front and its contents and dissociate the composition of the upper storeys from the lower ones. Failure, however, occurs in that the establishment by this treatment of a factor of architectural proportion integral to the whole front has as yet failed to obtain recognition. The architect supposes that his problem has been solved, and proceeds in designing the floors immediately over to dispose their proportions in the traditional way, employing lintels and openings of ordinary narrowness, each of which is unconsciously engaged in defying the exaggerated yawn of the cavern below, which is spanned by an abnormal member of their own architectural family. It may be more easy to point out than to demonstrate that the system of proportion compelled by the ground storey should be recognised in the design of the upper ones, and though openings above are not required of the extent of that below, a logical symmetry of spacing would take the first factor, and by progressive reduction or systematic subdivision apply the scale and diminish the proportions harmoniously.

(To be concluded.)

#### AN AMERICAN COLOUR SCHEME.\*

THERE can be no doubt that the rare beauty of the Pan-American Exposition—especially its beauty of light and beauty of colour—suggested new dreams, awakened new ideals and aspirations, and did this so broadly that the thrills of its artistic impetus may be said to have reached very far. If disappointment over the Exposition's financial failure was not keen enough to destroy the pride in the artistic achievement, it would be more than natural that, instead of reaction, the Fair's incentive to a demand for lovelier environment would have been felt most strongly in its own immediate neighbourhood, where the daily and nightly beauty had been a constant reminder of what might be, if men would. And this seems happily to have been the case. It is common report that there has been in Buffalo such a rush of civic and public spirit since its close as had not been known before. It is evidenced in a thousand ways, of which the organisation of the strong and large Society for the Beautifying of Buffalo is merely one, of special significance, and the princely gift of a splendid zoological park, with the means to maintain it, is but one other.

From the neighbouring manufacturing community of Echota, however, there now comes report of a development far more novel and striking than these. It is the adoption of a colour scheme for a whole town, the employment of a prominent artist to devise it, its acceptance and the adherence to it—even to its minutest and most unexpected details—by the entire community. This must be something quite unique. The influence of Mr. Turner's successful scheme of harmonising colours for the Pan-American is easily discerned.

Echota is one of those settlements that are marking the immense manufacturing development which has followed the utilisation of Niagara's electric power. It is situated a couple of miles from the city of Niagara Falls and on high ground back from the river, perhaps half a mile. It is purely a residential area, comprising within itself no manufacturing plants; but its 127 houses, with the necessary stores and other buildings, make a village in themselves. One of the big power companies owned the tract, laid it out in rectangular streets, put up the houses in lots of dozens or scores, and rented them to its employes. The houses are two-storey frame dwellings,

\* A communication from Charles Mulford Robinson in "Architects and Builders' Magazine" of New York.

with a pretence of the familiar suburban straining for art and variety. They were, however, uniformly painted yellow with white trimmings, and this had put on the place the unmistakable stamp of single ownership. With the course of time the weather, the wear and dust, aided by the smoke from the busy railroads that skirt the town, had so stained and soiled the original colours that repainting was necessary. The company had outgrown its desire to pose as owner of the tract, and it resolved, before giving the contract for the town's repainting, to employ an artist to draw up an attractive colour scheme that should add to the merit of durability the æsthetic advantages of harmony and variety.

The artist selected was Mr. Reginald Cleaveland Coxe, a painter of widely recognised ability and president of the Buffalo Society of Artists. He made a careful study of the town, found the streets broad and well paved, the houses surrounded by gardens, a great number of young trees set out, and the general aspect of the place—aside from its need of repainting—prosperous and attractive. Then he set to work on his colour scheme. Unlike Mr. Turner, he had no models of the houses, no drawings to work upon; but he had a task that was new, congenial and pleasant, and that by its artistic possibilities enlisted his full interest and sympathy. And to carry harmonising colours in his head was for him no more difficult than for a musician to carry the air of his own composition. In due time he made his report. The company accepted it very creditably without a criticism or suggestion, and gave him *carte blanche* to carry out his recommendations.

The painting was done last fall, and the colour-symphonic town, in the heart of a manufacturing district, now stands for all the world to see—a new sight for Niagara. The contract was let, it may be said, with a regard for material and workmanship that is good evidence that the "sight" will linger, and with a disregard for self interests that fully justified the company's confidence.

In the general effect there is far more variety than one would have anticipated. That is the first and most striking impression, and it is one of the most commendable. Art conceals art so skilfully that the visitor would have to think twice before he realised that not a colour jarred, and so that there must have been collusion or a single underlying scheme. All is restful, beautiful, concordant. For the most part Mr. Coxe has employed a combination of greys and greens, with here and there, to lighten the total effect, a warmer colour bordering on the reds. In a very few cases, as on a house of colonial architecture, he retained the original yellow and white. Some of the most interesting work is at the street corners, where it was necessary to combine the colour schemes of two streets. Thus at one corner there is an engine-house that has been painted a light grey-green, which harmonises completely viewed from any point. But unless your attention was called to this you might miss it, for several houses near by have been treated with richer colours that, by their relative prominence, the difficulty might not appear.

The largest building in the town is the garbage disposal works. This has a background of trees, and Mr. Coxe has had it so painted that it is almost lost in the foliage behind it. Running the united length of all the gardens of the houses that back upon the railroad there is a lattice, in front of which has been planted, for its whole distance, a row of evergreens, which some time no doubt will take its place. This lattice, then, has been painted a moss green, so that its presence is already nearly forgotten. Now and then among the houses a richer colour appears—a salmon, for instance—but it has been approached by such gradations that when you realise it you find yourself turning back to see how it could have been led up to so unobtrusively. The whole scheme is most interesting and instructive. It might well incite imitation on streets or blocks, if not by whole communities.

Not less interesting than the magnitude of this colour scheme is the completeness of detail with which it has been carried out. Not only is every clothes pole treated as an essential part of the composition, but, with the success of the general plan, outside corporations expressed a willingness to do their part in making the harmony complete. The International Traction Company, controlling the trolleys, repainted its waiting-room; the railing along the railroad tracks was given a new coat to bring it into tone with its surroundings; the Bell Telephone and the Home Telephone Companies joined with the Power Company in asking Mr. Coxe to select the colours for the telephone poles, in order that there might nowhere be a single jarring note. The whole result is so successful that the late news that the Mayor of Akron, Ohio, has asked for the appointment of an art commission, whose members should be the arbiters for all outside painting in the town is not as startling as it might once have been.

In closing, it may be said that the colours for Echota were chosen with special reference to the time of year when the town is seen by the greatest number of persons. This is when

the trees are in leaf. Then Echota will offer none of the contrasts so familiar in village landscapes, but with its grey-greens will become a part almost of nature's picture—a study well worth attention.

## DISAPPEARING EDINBURGH.

**A**MID the indiscriminate havoc wrought upon the buildings of Edinburgh, says a correspondent of the *Scotsman*—havoc which threatens speedily to end in utter extermination—a few remarkable houses still remain on either side of the roadway. One is the familiar popularly known as John Knox's House, the other a grand and stately structure of hewn stone which enters from Fountain Close, immediately below the tenement anciently called "Fountain," presumably because the conduit, now transferred to the opposite side of the street, was in earlier times part of the basement wall of the building.

In the days of Queen Mary these two houses were abodes of two notable citizens and burgesses of Edinburgh. They were, each of them, men of wealth, energy and high spirit, who naturally took a prominent part in the civic and national life of the time.

One of the two, James Mossman, was the son of a goldsmith to James V., said to have made the arches which enclose the ancient crown of Scotland. The entire crown worn by Mary of Lorraine, James Mossman inherited his father's business, and so became goldsmith to Queen Mary. He became proprietor of the house at Fountain Close by his marriage with Marriot Arres, daughter and co-heiress of John Arres, of whose considerable estate this building was a portion. In further evidence of Mossman's wealth and importance it is recorded that he purchased from the Hume the lands of Laughermendstone, in the parish of Edinburgh, and so became a laird as well as a burgess. His coat of arms, with his initials and those of his wife are still conspicuously visible in front of the old house which was his proper dwelling-place. Mossman, as befitted his office, was a staunch adherent of Queen Mary, and clung to her through good and evil report to the end of his life. He was executed from the sculptures and inscriptions which adorn his monument he would seem to have been a religious man, but whether Protestant or Catholic is not known.

Adam Fullerton, who occupied the opposite house, was no record of his business pursuits, nor is he known to have practised any handicraft. He was probably a wealthy member of the Merchants' Guild. Fullerton was a zealous reformer. In 1559 we find him stoutly maintaining Protestantism against the alleged encroachments of the Queen-Regent. In 1561 he, being a bailie, appears, along with Provost James Douglas, of Kilspindie, as prosecutor of a poor craftsman, who, being convicted of the heinous offence (in Protestant eyes) of playing Robin Hood, was condemned to be executed, and only escaped execution by a successful uprising in favour of the always formidable Edinburgh mob. Again Fullerton's name recurs in contemporary annals. In 1571, when Edinburgh was besieged by Regent Mar, in the name of the king, we find Adam Fullerton, along with other burgesses, who elected him their captain, escaping from the beleaguered city to join the ranks of the besiegers. In 1572 he, along with other and greater men who stood for the Queen, was condemned and forfeited for high treason. Queen Mary's Parliament held in the Tolbooth of Edinburgh. His house in Fountain Close was promptly taken into possession of and its roof converted into a platform for artillery to reply to Regent Mar's batteries at the Pleugh. Thus matters remained until, in July 1572 the queen, under Kirkcaldy of Grange, evacuated the town and retreated to the castle. Fullerton immediately resumed possession of his house, and now it was the turn of James Mossman to be a fugitive. He took refuge in the castle, and there he remained until the surrender in 1573 to Sir Wm. Drury, commander of the English auxiliaries, who at once handed over his prisoner to the ruthless Regent Morton. Morton immediately executed the gallant Kirkcaldy, his brother, and other leading men of the garrison, among whom was the hapless James Mossman—a martyr for his loyalty to a fallen and hopeless cause.

In the same year, internal quiet being restored, Fullerton carefully repaired the damage done to his house during the siege, and, to celebrate his party's triumph, adorned it with an unusually handsome double door, where may still be read the inscription in which he recorded his victory. The writings are as follow:—

Vincit—Only . be . Cryst . Adam . Fullerton.  
Veritas—Aryse . O . Lord . Marjorie . Roger . 1573.

It only now remains to trace the supposed connection between John Knox and the forfeited Mossman. The Dean of Guild Miller has amply proved that the official

Reformer during his Edinburgh ministry was not the Netherbow, then and for many years later in possession of its rightful owner. But it has been suggested that August, 1572, John Knox, broken in health, returned to Andrews at a time when the upper city, distracted by civil war and danger of the siege, was no fit abode for an old man. It is more probable that the Reformer was in the quietest and safest part of the town, in the deserted dwelling of James Mossman, where he may have remained under the immediate protection of the adjoining post at the Netherbow Port. Here, then, according to tradition, John Knox spent the last four months of his life. From this house he was carried to his last resting-place in the Netherbow Churchyard, and here, it may be, is found the ancient tradition which has so long associated the Reformer's mansion at the Netherbow with the memory and achievement of the great Reformer.

The restored Mossman house, in the hands of its trustees, is present at all events tolerably safe. Would it not be an achievement if in like manner the house of Adam Smith were adequately repaired and protected?

Two tenements would then form a substantial and most interesting memorial of one of the most important episodes in the life of one of the most notable men recorded in our civic history.

## TESSERÆ.

### Greeks and Easterns.

The Western mind dwells chiefly in the present, the Greek in the past and the Eastern in the future. That is why the Greek, the highest type of the lyrical mind, fed upon the past, and the Greek, the highest type of the epic mind, fed upon the future. The Hebrew lived upon prophecy, and the Hebrew, even in their buildings, it may be seen how they looked forward to after ages. The prevailing feature of Hebrew architecture is its massive grandeur, its stability; they built for posterity. Solomon said at the dedication of the Temple, "I have built a house of habitation for Thee, and a dwelling for ever." The only exception to this is the Saracenic architecture, and it is an exception that proves the rule; since, if need were, it could easily be made to conform to the rule. The Moslem faith, which, disregarding a future upon earth, looked upon such a death as might insure a future in the hereafter, amidst the bowers of the Houris. Greek architecture, on the other hand, neither mocked the eye as did the Egyptian palaces by a seeming frailty and contempt of permanence, nor like the heavy piles of Egypt and the East, impressed the idea of strength and of futurity upon the beholder; it rather by marble friezes and other sculptures embodying the past to set the hoary crown of old upon the brow of their temples.

### The Picturesque and the Beautiful.

It is a remarkable fact that the general acceptance of a word is more precise and more comprehensive than any philosophical definition of it that can be given. The picturesque, in the sense of Price's recommendation that it should be detached from painting, never has had any other meaning than "that which is pleasing to the eye, and may be called by the painter's art." It serves to denote any kind of beauty, of any degree of beauty. Man's natural indolence and the laziness of language have brought it into very general favour. Qualitative epithets require thought; the terms to qualify scenery are few, and picturesque may be applied with propriety to the subjects of Hobbeina or Salvator. The only real difference between the beautiful (in its sense) and the picturesque is that which must necessarily exist between the reality and its motionless representation on the surface. There is much of beauty that is beyond the power of art. The picturesque comprises only that part of nature which painting can represent, and, moreover, the word implies that the beauty which it expresses will be found, when closely examined, to be visible beauty addressed to the eye. The tourist in Switzerland does the tourist, after toiling up a steep ascent, come upon some bird's-eye view of immense beauty. The snowy peaks of the Alps indent the blue sky like the teeth of a saw. Below them are spread long intermingling pine-covered ridges. Beneath his feet two or three miles of bright and unruffled as mirrors, gem the surface of the cultivated plain. To represent this, art could do nothing without the mechanism of a panorama. Who would not exclaim, "How beautiful;" and yet is it visible beauty, that so much affects him? The grandeur and beauty of nature, the silence and repose of the scene, the vastness of the landscape, the horizon of snows that have never melted, the creation, thrill him with awe. Yet the colouring

wants richness and variety; there is no air-tint to mark distance; the forms are monotonous by their repetition, and the equality of the masses deprives them of effect. Compare this with some well-remembered scene, where, from the hills in the neighbourhood of Rome, the eye gazes on the plains of the Campagna varied by the richest tints, and bounded on one side by the sea, on the other by the purple Apennines which gradually melt into it by the softest and the grandest undulations. Does not the Swiss view affect us rather by the emotions it excites than the elements of beauty it presents? but when beautiful is applied by mankind to everything that impresses them agreeably, from an epic poem to a pot of beer, can we urge that it should not be applied to an object which gives us such exalted pleasure, and that, too, through the medium of the sight? The word picturesque comes to our relief, and the discussion is closed by admitting that the Swiss is poetical but not picturesque.

### The Corinthian Capital.

The account of the accident which suggested to Callemachus the hint for composing a new capital is known to every one. John Shute, an English architect of the sixteenth century, was evidently pleased with the story, and as it stands in his book it has more freshness and simplicity than the barer narrative of the Roman writer, so we shall repeat the legend in his words:—"After that, in the citie of Corinthe was buried a certaine maiden, after whose burial her nourishe (who lamented much her death), knowing her delightes to have bene in prettye cuppes, and such like conceytes in her lifetime with many other thinges, appertayninge only to the pleasure of the eye, toke them and broke them and put them in a littel prettie baskette, and did sette the basket on her grave, and covered the basket with a square pavinge stone. That done with weeping teares she sayde, 'Let pleasure go wyth pleasure,' and so the nourishe departed. It chanced that the basket was set upon a certain roote of an herbe called acanthus, in French Brankursine, or Beare fote with us. Now in the spring time of the yere, when every roote spreadeth fourth his leaves in the increasing, they did ronne up by the sides of the basket, until they could rise no higher for the stone that covered the basket, which, being square, and castinge his foure corners over the sydes of the rounde basket, constrained the branches of the herbe to draw downwardes againe with a certaine compasse, and so drew to the fashion that Vitruvius calleth Voluta. . . . In this citie one Callemachus, an excellent architectur, passinge or going thereby, regarding the beautiful worke of nature," devised a column and set a capital upon it in imitation of the tomb which he had seen. This story is generally supposed to be no more than an idle fancy, invented or repeated by Vitruvius. Nevertheless, the circumstances related here are probably an indication of the ideas which the Classical architects associated with the third order of columns. Although this pillar is called Corinthian it might appropriately be called Æolic, and represent the third division of the Greek race, since the names Doric and Ionic were given to the preceding orders.

### Assyria and Athens.

Stone, if not in great quantities, was accessible to the builders of Nineveh; nevertheless they built in brick, for their architecture, like all their art, had its origin in Chaldea—that is, in a country where there was no stone, but where, on the other hand, clay abounded for the making of bricks and tiles. Meanwhile the broad and empty surfaces of their buildings, surfaces almost wholly unrelieved by mouldings—for this form of enrichment did not, with such a material, readily suggest itself in so early a stage of art—required profuse adornment to satisfy Assyrian love of splendour and to be worthy of Chaldean tradition. Here stone found its opportunity, and soon colossal monsters, human-headed, but limbed like a bull and winged—types of strength and wisdom—took post at gateways and approaches, whilst long lines of sculptured frieze ran, level with the eye, along the interminable walls. To this enrichment of the ground line of their palaces the use of stone by the Assyrians was limited; above this line another mode of adornment was chiefly used, namely, a casing of glazed and coloured tiles, wherein you see the origin of that marvellous decoration which to this day in the same regions throws its enchantment over fields of wall-space hardly less flat and free from moulded features. For internal embellishment and for detached structural supports Assyria had wood and metal, a combination indeed which lies at the origin of all decorated columnar forms; of such piers or columns material evidence no longer exists, except it be in charred fragments, but other reasons besides structural requirements would suffice to convince us that they had existed. In the first place, as is acutely argued by Mr. Fergusson, it is no doubt of these supports that we see the reproduction in stone in the wholly borrowed art of Persia; secondly, their use in tents and aedicules, and as a decorative feature of windows practically involves their application to a more important function; and lastly, the deep influence on the Ionic art of this amongst many Assyrian forms implies in itself

its large and general use. Thus this architectural feature, which attains its highest beauty of abstract form in the porch of the Erechtheum, has for its first rude ancestor a cedar pole and a curl or two of copper.

#### The Fine Arts Commission.

On November 22, 1841, was issued the Royal Commission of Fine Arts, a preparatory step to which was the appointment of a committee, one of the last acts of the session, to take into consideration the promotion of the fine arts in this country in connection with the rebuilding of the new Houses of Parliament. It was the first recognition on the part of any government in this country that historical painting ever existed here. Mr. Barry, the architect, Mr. Eastlake, Sir Martin Archer Shee and other witnesses gave evidence in favour of the employment of painting, and consequently the royal commission was appointed at St. James's Palace, and dated November 22, 1841, naming as commissioners His Royal Highness Prince Albert, Lord Lyndhurst, the Duke of Sutherland, Marquis of Lansdowne, Lord Lincoln, Earl of Aberdeen, Lord John Russell, Lord Francis Egerton, Lord Palmerston, Lord Melbourne, Lord Ashburton, Lord Colburn, Charles Shaw Lefevre, Sir Robert Peel, Sir James Graham, Sir Robert Inglis, Henry Gally Knight, Benjamin Hawes, Henry Hallam, Samuel Rogers, George Vivian and Thomas Wyse, to which list of commissioners Mr. Eastlake, R.A., was appointed secretary by Her Majesty. The terms of the commission were for its members to "inquire whether advantage might not be taken of the rebuilding of our palace at Westminster, wherein our Parliament is wont to assemble, for the purpose of promoting and encouraging the fine arts in our United Kingdom, and in what manner an object of so much importance could be most effectually promoted," and commanding that any five or more may form a quorum with power and authority to summon and examine any witnesses likely to afford information upon the subject of the commission. The exhibition of the cartoons was opened on July 3, 1843. The sum of 2,000*l.* was voted for the encouragement of art and divided amongst eleven artists; a large sum was raised by the shillings taken at the doors, the attraction being works contributed by a great number of artists at an enormous collective outlay of time and money. Had such a great step to ascertain the state of historical talent been taken in France, the Louvre would have been thrown open free to the public, and any premiums awarded charged upon the national expenses. So rigidly were the shillings exacted at the pay-door of Westminster Hall that the artists themselves, whose works were the point of attraction, had to pay every time they entered the hall until the "free" time had arrived, and had not even a catalogue presented to them. The sum voted by Parliament was distributed in three prizes of 300*l.* each to Messrs. Armistage, Watts and Cope, three prizes of 200*l.* each to Messrs. Horsley, Bell and Townsend, and five prizes of 100*l.* each to Messrs. Parris, Severn, Bridges, Frost and Selous. Some compunctious visitings, however, induced the commissioners of fine arts to distribute 1,000*l.* more out of the proceeds of the exhibition, and accordingly ten cartoons were selected as worthy of reward; those were by Messrs. Pickersgill, Corbould, Howard, R.A., W. C. Thomas, Stephanoff, Claxton, F. Howard, Rippin-gille, J. C. Waller and Sir W. C. Ross, R.A.

#### EDINBURGH ARCHITECTURAL ASSOCIATION.

THE members of the Edinburgh Architectural Association visited on Saturday last the Broch of Tappoch, situated on the summit of the Torwood, about three miles north of Larbert. It is one of the few existing in the south, their chief locality being the four northern counties of Scotland, where they exist in some hundreds, while in the southern counties there are only about six or eight. The Tappoch is one of the strongest of the brochs, having walls about 22 feet thick, and an external diameter of about 80 feet, and its ground floor is absolutely of solid masonry, while it was surrounded by two strong walls, of which considerable remains still exist. All knowledge of this ancient structure was lost till about forty years ago, when its ruins, then a grassy mound, were explored and laid open to view. The period of the erection of the brochs has been assigned to the four or five centuries following the withdrawal of the Roman troops from Britain. After spending nearly an hour at the Tappoch, the party proceeded across the fields to visit the ancient castle of Torwoodhead, built by the Baillies, descended from the Baillies of Castle Cary in 1566, as is shown by the figures on a finely-carved stone found in one of the field dykes. The castle is a very pleasing example of the kind of house erected by a Scottish laird four or five centuries ago, and would even yet, with a few alterations and improvements, make a most charming residence.

Professor William M. Flinders Petrie has been recommended by the Council of the Royal Society for election as a Fellow.

#### GENERAL.

The Postmaster-General has appointed Mr. M. and Major W. A. J. O'Meara, C.M.G., R.E., to be engineers-in-chief to the Post Office.

The Earl of Camperdown has been appointed of the joint committee of the House of Lords and the Commons on the question of the Housing of the Classes. The members will meet to-day (Friday).

M. Pierre Jamier, the Belgian architect, Brussels on the 10th ult. He was born in 1825. He has been engaged in the restoration of the Hôtel de Ville and the Maison de la Ville, and other works in that city.

Mr. J. C. Mansel-Pleydell died on Saturday last, eighty-fourth year. He was the president of the Antiquarian Field Club, and was an authority on the existing in the county.

Sir John Aird has had a tablet fixed to the 18 Howley Place, Maida Vale, in memory of Henry the composer. The tablet, specially manufactured by Doulton & Sons, bears the inscription:—"Henry the Composer, lived here. Born December 24, 1813. Died December 7, 1900. 1902."

Mr. A. G. Temple, the director of the Guildhall Art Gallery, states that last year during the 262 days that the gallery was open it was visited by 369,599 persons, that total in the 305,000 persons who visited the art loan exhibition of Spanish painters.

The Bognor Urban Council have accepted the tender of the Victoria Stone Company for supplying and laying paving in Richmond Road and Lyon Street West.

The Forty-Second Annual Dinner of King's College, London, will be held at the Monico on Monday, June 8th. The chair will be occupied by the Right Hon. and Right Rev. Lord Bishop of London.

Mr. A. Gilbert, R.A., has had a suite of rooms at the Tower of London assigned to him to be used during the time when he is engaged on his statue of the Queen.

A Collection of mezzotint portraits of the eighteenth and early nineteenth centuries is on exhibition in the Gallery of the Burlington Fine Arts Club.

M. Delattre has discovered on the site of Carthage the depth of about 26 feet, a sarcophagus of white marble with sculpture and paintings. A figure of a woman is seated in high relief; her hair is gilded, the eyes are of enamel, and she wears a necklace of fine form.

The Bournemouth Town Council have authorized a committee to report on the erection of a pavilion at the end of the pier, the cost not to exceed 30,000*l.* exclusive of furnishings.

Slindon, in Sussex, is a picturesque village although a few miles from the sea-coast, was once mainly by smugglers. In spite of its attractions, not a single house has been erected in the village for a quarter of a century.

Messrs. George Munday & Sons have obtained a lease from the Court of Common Council to erect a new chill-rooms and other buildings at the Foreign Market, Deptford, for 21,056*l.*

Dr. Rudolf Herzog, Professor Vosseler and Herr H. H. about to visit the island of Cos, in the Grecian Archipelago, in order to undertake excavations which are expected to yield important archaeological discoveries.

The Fifth Art Exhibition of Venice will be opened on April 1, 1903. A sum of 100,000 francs has been assigned for official purchases intended for the International Modern Art Gallery. Gold medals will be awarded for the finest works.

The Princess Mathilde has presented to the Bibliothèque Nationale, Paris, an album containing eighteen water-colour drawings, portraits and studies of her own production.

Mr. Akers-Douglas has stated in the House of Commons that in the widening of Piccadilly sixteen trees were cut down of which eight were in a decaying condition. Forty-eight trees, on the other hand, have been planted either in the Park or on the footways. The expenditure on the work, 8,500*l.*, is borne by the London County Council. Within the park the Office of Works has spent rather over 10,000*l.*

The Prix Fould, of 5,000 francs, for the best work of history of art up to the end of the sixteenth century, has been awarded by the Académie Française to M. Durand for his monograph on Notre-Dame Cathedral, Amiens.

At the General Meeting of the Surveyors' Institution it was decided that the question relating to the title "chartered surveyor" remain in abeyance until steps had been taken for ascertaining, by means of a circular letter, the views of members throughout the country. The next ordinary meeting will be held at the Guildhall, Cambridge, on Thursday, May 22, and the annual general meeting in London on May 29.

## EDITORIAL NOTICES.

*view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*respondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

## TENDERS, ETC.

*As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

## COMPETITIONS OPEN.

**REWE.**—June 12.—Designs are invited for new municipal and council chamber. The author of the design which is judged best will receive a premium of 50*l.*, and he will be invited to carry out the design; second premium, 25*l.* Particulars will be supplied by the Borough Surveyor, Municipal Buildings, Crewe.

**HARROGATE.**—May 14.—Designs required for a new town hall. Premiums, 150*l.*, 100*l.* and 75*l.* Mr. F. Bagshaw, Municipal Engineer, Harrogate.

**HARTSHILL.**—June 16.—The committee of the North Warwickshire infirmary and eye hospital, Hartshill, Stoke-upon-Avon, invite designs for a home for nurses at Hartshill, Stoke-upon-Avon. Particulars may be obtained on application to Mr. E. Boyce, secretary and house governor.

**KNARESBOROUGH.**—June 1.—The Harrogate and Knaresborough Joint Isolation Hospital Committee invite competitive designs for an infectious disease (other than smallpox) hospital

at Thistle Hill, Knaresborough. Premiums of 100*l.* and 50*l.* are offered for the two selected designs. Mr. J. Turner Taylor, clerk, Municipal Offices, Harrogate.

**LIVERPOOL.**—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

**SUNDERLAND.**—Aug. 30.—Designs are invited for proposed police and fire-brigade buildings to be erected in Gill Bridge Avenue and Dun Cow Street. Premiums of 100*l.*, 50*l.* and 25*l.* are offered for first, second and third designs respectively. Mr. Fras. M. Bowey, town clerk, Town Hall, Sunderland.

**TOTTENHAM.**—July 15.—Designs are invited for municipal buildings, fire station, public baths, &c. Premiums of 200*l.*, 100*l.* and 50*l.* are offered for the three best designs in order of merit. Mr. W. H. Prescott, surveyor to the Council, Tottenham.

**WEST HARTLEPOOL.**—June 27.—Competitive designs are invited for a new higher-grade school to accommodate 1,200 children, schoolkeeper's house, &c., proposed to be erected in Elwick Road, Eamont and Belmont Gardens, West Hartlepool. Premiums of 75*l.* and 35*l.* respectively. Mr. J. Robson Smith clerk, School Board Offices, West Hartlepool.

NEW CATALOGUE.

Messrs. P. & R. FLEMING & Co., Argyle Street, Glasgow, be congratulated on the businesslike appearance and lucid nature of their new illustrated catalogue, which, in spite of its multitudinous forms, comprising agricultural implements, gates and grilles of every description, collapsible gates, shutters, boring tools, tree and other guards, girders, benches, garden furniture, stable and farm fittings and utensils, corrugated and other buildings, wind and other machines, &c.

DURESCO, DECORATIVE AND PRESERVATIVE.

Mr. CRICHTON BROWN, in an interesting address delivered on the 24th ult. at the jubilee meeting of the Manchester Sanitary Association, gave a sombre picture of the pall of smoke and soot which is the common environment of cities. His picture was not overdrawn, and if anything can be done to mitigate and obviate the evil, his address will be done good. Apropos of this it occurs to us that it may not be amiss, in view of the general furbishing-up which is going on in the Metropolis in honour of next month's festivities, to remind our readers that "Duresco," which is manufactured by the Silicate Paint Company (J. B. Orr & Co., Ltd.), of Charlton, has a well-deserved reputation as either an invisible or a decorative dressing for the preservation of stone and brick from the deleterious influences to which they are subjected owing to the atmospheric conditions of this and other

large towns. Many buildings are now in process of being scraped, cleaned, pointed and generally rehabilitated, and the result for the time being is eminently satisfactory; but, unfortunately, we know only too well that the improvement is only temporary, and soon the stone or brick has reassumed the grimy tone which we are too much accustomed even to note unless our attention is drawn to it by the contrast afforded by the brightness of an adjacent newly erected building. A dressing of "Duresco," however, has a lasting effect owing to the indurating effect it exercises on the wall to which it is applied, which consequently it renders much less susceptible to the corrosive effects of the acids with which the air is always more or less impregnated.

ROADS AND HOUSING.

THE Hon. A. Stanley, M.P., has placed the following important notice of motion upon the agenda paper of the House of Commons:—"To call attention to the entire suspension of road building activity in England and Wales since the abolition of the Turnpike Acts; to the congestion of traffic and of population in the large towns by reason of the fact that no new trunk roads through and out of them have been constructed for several generations; to the growing difficulty and increasing cost of transporting goods by road and their serious effect upon the industrial efficiency of the nation; and to move that in the opinion of this House immediate steps should be taken to facilitate the construction of new trunk roads, both by private enterprise and public authorities." The Leader of the House of Commons is being approached with a view to the Government granting a public inquiry into the existing system of highway administration, with special reference to its bearing upon the housing and transport questions. The view is gaining ground that "tubes" and trams are more or less expensive and unsatisfactory substitutes for broad trunk thoroughfares. No new main roads out of London, for example, have been built for many generations, although population and traffic have increased many times.

THE conversazione of the Institution of Electrical Engineers will be held in the Natural History Museum on Tuesday, July 1. The Metropolitan District Railway has promised to open the subway from the South Kensington station to the grounds, for the benefit of guests travelling by their line.

## TRADE NOTES.

OAKLEY GRANGE, Shrewsbury, has been fitted with the latest improved hot-water heating apparatus by Messrs. John King, Limited, engineers, Liverpool, employing their "Rahnee" radiators and "Rex" radiator valves.

MESSRS. MATHER & PLATT, LTD., engineers, of Salford Ironworks, Manchester, have been instructed by the Metropolitan Electric Supply Co. to install a second plant for softening and purifying water by the "Archbutt-Deeley" process for an output of 10,000 gallons per hour. This, with the apparatus installed by them previously, makes a total capacity of 20,000 gallons per hour. They are also instructed by the General Electric Supply Co. to provide similar plant of a capacity of 23,000 gallons per hour for Grove Road station. In addition to the above the same firm have orders for water-softening apparatus on hand for the Great Northern Railway of Ireland, Messrs. Belliss & Morcom, of Birmingham, and others.

## ELECTRIC NOTES.

THE "Savoyarde," the big bell in the Basilique du Sacré Cœur on the heights of Montmartre, is henceforth to be rung by electricity.

THE Little Woolton Urban District Council have approved a scheme for the lighting of the roads of the district by electricity. At present oil lamps are used, and, of course, occasion much inconvenience in keeping clean and well filled, and in lighting and extinguishing. The change will necessitate the laying of a special cable over nearly eight miles.

THE Bill for the confirmation of the provisional order under which the Urban District Council of Tipton are seeking Parliamentary power to light their district by means of electricity came before Mr. Symons Jeune, one of the examiners of petitions for private Bills, for proof of compliance with the Standing Orders of the House of Lords. The Bill was duly certified and the order was confirmed.

AN inquiry was held at Bath, on the 1st inst., by Mr. Bicknell, a Local Government Board inspector, into an application by the Corporation for a loan of 25,000*l.* on account of the electric lighting. The sum was made up of two amounts, 11,195*l.* being excess of expenditure over loans previously sanctioned, and 13,000*l.* for new plant and alterations in the

system of working immediately required to be expended enable the works to be carried on during the next winter if breakdowns of last winter are not to recur. Mr. J. A. Sin conducted the case for the Corporation, and Mr. E. Manly gave expert evidence.

## BUILDING AND BUILDERS.

A MASS meeting of Glasgow operative plumbers was last week in the Waterloo Rooms to consider the situation regard to the overtime dispute, it was reported that 75 firms employing 600 men had conceded the terms demanded, and only about 300 men were still on strike.

PLANS by Mr. W. P. Gibbings, on behalf of the Carlisle Estates Company, Ltd., for the erection of over ninety shops in Botchergate, Carlisle, have been passed by the coronation committee. The site of the proposed shops is that of the St. Cuthbert's vicarage and garden, including a piece of ground now occupied by Algie's Circus.

THE improvements committee of the Leeds Corporation had before them last week the recommendations of the Local Government Board with regard to the local by-laws. It was decided to fall in with the views expressed by the Board on the matter, and to submit for the consideration of the local authority the by-laws in an amended state.

THE foundation-stone of new schools in connection with All Saints Church, Marple, was laid on the 3rd inst. by Mr. Edward Chapman, M.P. for the Hyde division. The schools are arranged to accommodate 300 children, the contract being carried out by Messrs. Robinson & Sons, of Hyde, from designs by Messrs. James Hunt & Son, architects, Stockport.

SOME time ago the master bricklayers of Edinburgh proposed a reduction of the operatives' wages from 9*d.* to 8*d.* per hour. The matter, however, has been satisfactorily settled. At a recent meeting between representatives of the employers and of the Operative Bricklayers' Society it was mutually agreed that the present conditions should continue for another year.

A STEEPLEJACK named Thomas Howarth, aged forty, died at Bolton Infirmary from shocking injuries on April 1. He was putting a new top on an ironworks chimney when he missed his footing on the scaffold, and had a fall of a hundred feet. In his descent he grasped the scaffolding rope, but

## WILSON'S PATENT "MULTILUX" WINDOW

The above illustrates an office where the light coming from the sky falls on to the floor and is absorbed, thus leaving the back part of the room dark. The illustration below shows the same room with WILSON'S PATENT MULTILUX WINDOW fixed. This refracts the rays of light and throws them horizontally, thus preventing them falling on to the floor, and lighting up the whole room.

DESIGN FOR A COUNTRY RESIDENCE.

and Howarth was precipitated through the roof of a house, and was dreadfully injured.

COLONEL A. C. SMITH, R.E., held a Local Government inquiry at Southport into an application by the Corporation to borrow 2,500*l.* for the purpose of erecting a bridge across the L. and Y. Railway at Oak Street, and 2,000*l.* for the construction of open-air swimming baths at Crowlands. In respect to the latter, it was stated that the water would be heated by steam from the destructor.

THE foundation-stone of a new mission church for Five Ways, Heath Hayes, Cannock, was laid recently by Mrs. Hanbury, who was accompanied by her husband, the Right Hon. R. W. Hanbury, in the presence of a large gathering. The new church is to be dedicated to St. John the Evangelist, and will accommodate about 400 worshippers. It will cost 24*l.*

THE building committee of the Talbot Lane new chapel at Southport met on the 29th ult. to adjudicate on competitive plans which had been prepared by four architects. These included Gothic and Classic designs. The names of the authors were not disclosed. After a long and careful examination the committee proceeded to vote by ballot, when it was found there was a majority in favour of the Gothic design by Messrs. Hey & Son, of Bradford. The second place, according to the programme, was assigned to the Gothic plan of Mr. J. E. Knight, of Manchester. The third in order of preference was the Gothic design of Mr. J. Smith, of Sheffield. At a meeting of the committee and congregation on the following Thursday evening the accepted plans were submitted for inspection, and were generally and heartily approved. During the meeting the Rev. W. Slack briefly referred to the attempts which had been made to obtain a new site, to the delay caused thereby, and to the final decision of the committee to utilise the old site. In

order that full scope might be given for the erection of a beautiful and commodious church the trustees had agreed to have the cottage property at the south side and at the rear of the old chapel removed. From the west side of the town the building will be a very prominent object. The estimated cost is 6,800*l.*, but this amount will be exceeded by some improvements which would be effected in the Sunday school.

## VARIETIES.

MR. E. HARDING PAYNE, architect and surveyor, has removed from 28 to 11 John Street, Bedford Row, W.C.

THE Murphy memorial hall which has risen at the corner of Gurney Street, in the New Kent Road, was formally opened on Saturday afternoon.

THE Cairns memorial church, which occupies a prominent position in the Gorgie Road, Edinburgh, was opened for public worship on the 3rd inst. It is a substantial structure, cruciform in shape, and is seated to hold over 800 people.

MR. H. W. RISING, architect and surveyor, announces that he has dissolved partnership with Mr. Shoebridge, and that hereafter he intends to carry on his profession at 30 Great James Street, Bedford Row, W.C.

MR. FRANK DETHRIDGE, town clerk of Paddington and the doyen of London town clerks, has been granted a retiring allowance of 600*l.* per annum, in consideration of the "valuable services he has rendered to the ratepayers of London in general and of Paddington in particular" during nearly half a century of active official life. Mr. Dethridge ceases to be town clerk next Christmas, and will be succeeded by his chief assistant, Mr. J. A. W. Russell, secretary of the Metropolitan Municipal Officers' Association.

WE regret to announce the death on the 30th ult. of Mr. T. P. Lilly, the proprietor of the Chilmark Stone Quarries, which he had worked for the last forty years, in addition to which he took an active part in the construction of the Salisbury to Yeovil branch of the London and South-Western Railway, as well as of railways in Belgium and other places on the Continent; he was also possessed of considerable skill as an architect. The business of the Chilmark Quarries will be carried on under the management of his executors, Messrs. S. H. Stephens and Harry J. Lilly, and its title will remain undisturbed.

Telephone, 680 HOP.

THE drainage and other sanitary arrangements which were carried out at Buckingham Palace by the officials of His Majesty's Office of Works a few years ago have been thoroughly inspected and tested by Professor Corfield, M.D., the consulting sanitary adviser to His Majesty's Office of Works, who has reported "that the drainage arrangements have been very well planned and carried out, and reflect credit on all concerned with them." He has, however, suggested a number of improvements in the sanitary arrangements generally, the most important of which have been already carried out under his supervision, and to his satisfaction. The remainder, which consist chiefly of certain rearrangements, will be carried out in the autumn.

CHEAP tickets available for eight days will be issued by the Great Eastern Railway Company to Brussels May 14 to 17 inclusive and May 19, *via* Harwich and Antwerp. Passengers leaving London in the evening reach Brussels next morning, after a comfortable night's rest on board the steamer, for visiting The Hague, Amsterdam, Utrecht and other parts of Holland, the Rhine, North and South Germany and Bale. For Switzerland special facilities are offered *via* the Great Eastern Railway Company's Royal British Mail Harwich-Hook of Holland route, through carriages being run to Amsterdam and Berlin, Munich, Cologne and Bale. Restaurant cars are run on the North and South German express trains. The General Steam Navigation Company's fast passenger steamers will leave Harwich on May 14 and 17 for Hamburg, returning May 18 and 21.

#### LIVERPOOL UNIVERSITY COLLEGE EXTENSION.

TO-MORROW (Saturday) will witness the opening by Sir Wm. Thiselton-Dyer, F.R.S., of the handsome block of botanical laboratories which have been presented to Liverpool College by Mr. W. P. Hartley, of Aintree. This new addition to the educational resources of the college occupies a convenient site of about 3,000 square feet, with a frontage of 35 feet to Brownlow Street and 85 feet to Danzie Street, the whole of the land and the old buildings thereon having been purchased outright by Mr. Hartley. The great advantage of the aspect to Danzie Street is its north light. Both externally and internally the object has evidently been to meet the demands of utility by appropriating every available yard of space rather than to strive after architectural adornment, and the result reflects credit upon the architect, Mr. F. W. Dixon, of Manchester, and Professor

Harvey Gibson, who collaborated in the preparation of plans. Corridors have been entirely eliminated, all the apartments opening off a central hall, and one main staircase. The basement is divided into four parts as a storeroom, heating chamber, lavatories and coal stores, while the ground floor contains a workshop, a museum preparation-room, and a museum, which is approached direct from the entrance Brownlow Street. The museum is 45 feet long, 34 feet wide and 22 feet high, and is equally divided into an upper and lower section by means of a gallery which has been placed at a height of 11 feet. A spiral staircase communicates with the gallery, and it is also reached from the first floor. The lower portion of the museum will be open to the public during college hours. Twelve large specimen cases are arranged at right angles to the eight windows, so that light will shine sideways upon the glass and enable the specimens to be more readily examined. Sample cases are fixed on the walls and the window-sills, ample accommodation being thus provided for an extensive collection for teaching and exhibition purposes. One section will be devoted to specimens illustrative of the subdivisions of the vegetable kingdom, another to those illustrative of morphology and the adaptation of structure to function, while another will contain plants of service to humanity with their medicinal uses indicated.

An important department of the new building is the herbarium, located on the first floor. Here are stored about 100,000 dried herbs, including 50,000 specimens given to the college by the late Mr. T. Comber, and the collection of the late Mr. Lomax of the Northern Hospital, purchased by Mr. Hartley and others. Altogether there are about 200,000 general species, and almost a complete collection of British plants. Storage is provided for quite 200,000 plants. Already the collection will compare favourably with any provincial herbarium. Adjoining the herbarium is a classroom for advancing students, the library, the professor's private laboratory, an office, and a commodious lecture theatre seated for 100 students, and, when necessary, accommodation could be found for over 200. About 700*l.* has been expended on special movable fittings alone for the benefit of the professor and his pupils. The top storey of the buildings is occupied by five rooms, a research experimental physiology laboratory with dark room attached, an anatomical research laboratory, advanced and elementary laboratories, and a demonstration private room. Sixty-five students can operate simultaneously in the elementary and twelve in the advanced laboratory.

### THE SURVEYORS' INSTITUTION.

The annual dinner of the Surveyors' Institution took place  
 Wednesday evening at the Holborn Restaurant, Sir John  
 Rolleston, M.P., presiding. Among the guests were Earl  
 Beauchamp, Mr. Walter Long, M.P., Mr. Jesse Collings, M.P.,  
 W. T. Thiselton-Dyer, Lieut.-Col Sir G. A. Leach, Sir  
 John Wilson, Mr. H. G. Howse, Sir W. Pollitt, Mr. W.  
 E. P. Squarey, Mr. C. J. Owens, Mr. E. P. Squarey, Mr. A. Buck,  
 A. Vernon, Mr. L. R. Vigers, Mr. R. Vigers, Mr. T. M.  
 Kman, Sir Walter Peace, Mr. Howard Martin, Mr. A. R.  
 King, Sir Ernest Clarke, Mr. A. Murray, Mr. W. B. Rogers,  
 and others.

After the loyal toasts, Mr. E. P. Squarey, vice-president,  
 proposed "The Houses of Parliament."

Mr. Walter Long said that he was sorry to interrupt the  
 dinner with his remarks. Members of the Government, how-  
 ever, had to be in their places that night, because some  
 members of the House of Commons had ventured to challenge  
 the conduct of the Speaker. One member of the Government  
 would defend the Speaker, and it was only left to the others to  
 show their opinion that the conduct of the Speaker was right,  
 the attack upon him unjust, by being present and recording  
 their votes to endorse what he had done. As business men  
 would endorse what had been done by the House of  
 Commons in putting its affairs on a business footing. They  
 were anxious the work should be done without undue delay,  
 their latest change was to make the House of Commons  
 a gathering of talking men but a business assembly. On  
 whichever side they were, he believed the members tried to do  
 their duty, and if the electorate were not satisfied, they had the  
 remedy in their own hands.

Earl Beauchamp also replied.

Mr. Arthur Vernon proposed "Agriculture," to which  
 T. H. Elliott, secretary to the Board of Agriculture,  
 replied.

Mr. Howard Martin gave "The Bench and the Bar,"  
 Freeman, K.C., replying.

The Chairman responded to the toast of "The Surveyors'

Institution," mentioning that it was established in 1868, and  
 incorporated by Royal Charter in 1881. It had a membership  
 of between 3,000 and 4,000 of all classes, and had a large  
 branch in Ireland. The Society had recently erected a hand-  
 some building in Great George Street, Westminster, at a cost  
 of between 30,000l. and 40,000l., and it possessed a valuable  
 library and museum.

### PRINCIPLE AND METHOD.\*

BOOK upon book has been written upon the historical  
 development of architecture, but always regarding it as a  
 historical document. The sequence of styles is perfectly  
 established, but to whom is it of real use except to historians?  
 Architects value books on the subject chiefly for their illustra-  
 tions, and use them, not for the purpose with which the book  
 was written, but to help themselves in some way to design  
 modern work. In other words, every man, unconsciously or  
 half unconsciously, makes for himself, according to his light,  
 rules founded upon the principles of beauty, that is to say, the  
 causes of attractiveness, in the buildings he is studying, in  
 order that he may bring into being, not the same design,  
 which he knows to be impossible (if he is experienced), but  
 the same attractiveness, and for the same reason, in his  
 own work. It is needless to say how slow this process  
 is, and how ineffectual in many cases, where, never-  
 theless, the beauty of the building studied obtains full  
 appreciation. A mind capable of conception is very often not  
 strong in analysis. It wastes time and energy in feeling its  
 way to the results. What is necessary to enable it to work  
 rapidly and surely is a framework of principles and method  
 supplied from without. This is the real use of the architecture  
 of the past to the architects of the present—as architects—to  
 supply models from which the causes of beauty may be deduced.  
 It is only upon some such scientific basis of design that it is  
 possible to invent with ease. No man can mass design by  
 accident, and it is in massing that design really consists. As  
 all design consists in this, all ages supply matter for its illustra-  
 tion. Yet how little has been said about it. We learn in  
 works on architecture that the Greek pediment was low in  
 pitch, that the Romans pitched their pediments higher, and the

XVI. of THE ARCHITECT. Handsomely bound in Cloth. Price 12s. 6d. PREBEND STREET, LONDON ROAD, LEICESTER.

Gothic designer's gable was highest of all; but no lesson in design is drawn from this. We learn in every case merely what the designers of a period did; and, so far as construction in design is conveyed at all, we are taught only how to carry out historical unity in design. Experience teaches that there is more in preserving historical unity than the mere avoidance of offence to the eye of the educated. We avoid also offence to the educated eye. A mixture of different historical characteristics is fatal to the harmony of design. Knowing this, but not knowing clearly what is essential and what is not, the wise man goes by his book; and as he becomes skilled in the styles, comes, as all men do, to enjoy his skill and love correctness for its own sake. That is to say, from hatred of solecism he commits a wholesale solecism every time he builds.

This is not much to show for a faithful study of architecture. There must be more to be got out of it than that; the lesson of the history of architecture should be, not what the past designed, but how it was designed. The beauty of every great example has a reason. To return to the three classes of gables: there is reason, as shown by John Beverley Robinson, for the varying pitch. The Greek front, solid, widely spread, is suitably finished with a low pitched gable, while the Roman, more slender and vertical, naturally cocks it up, and the Gothic more again. This is the kind of truth we should learn from the history of architecture. To know how to be Greek or how to be Roman or Mediæval is merely to put one's self in fetters. To know why all three were good is to give one's self the freedom of design in any age—even in our own.

Mr. H. G. Wells, who is so fond of carrying his scientific observations into the future, has, in his new book of "anticipations" about the state of the world in the year 2,000, some speculations about the conditions of building. He is, of course, heartlessly scientific, and says (I quote at second-hand) that he expects the engineers of the future to be the great men of their time, but the architects to be opposed to progress, because they are "too highly cultured and not sufficiently educated." By "cultured" he evidently means trained in precedent, and by "educated" trained in science. Making allowances for his scientific point of view, and the probability that his idea of an architect's education is limited to a study of the properties of iron and concrete and sewage, the accusation, whether it is likely to be justified or not, gives a judicious pointer as to the need of more scientific education for architects in the future; an education which shall be scientific in all

directions, in design as well as in construction. The constructor has become inventive; the designer must become inventive too. I am well aware of the horror of lean iron for and of the necessity of forming new ideas of beauty, that idea of architectural invention brings before a well-regulated mind. But surely to study the principles of design is the way to prevent the realisation of this horror. There cannot be more than one set of principles of beauty in this world, even if it is possible to conceive of there being another set in any world. It looks, therefore, as if to take Mr. Wells's advice and devote ourselves more to "education" and less to "culture" the surest road to making beauty keep company with necessity that is coming to us of keeping design abreast with construction in our own times.

But a new departure in design is not what this article is about. It is clear that principle and method are the only road to such a departure when it becomes necessary. Culture, Mr. Wells's sense, has already met a Waterloo in the tall buildings of New York. In their case it is not until the dusk comes on to obliterate their architectural treatment, that a consciousness of their greatness is not obscured by a perception of their littleness. It must be possible to make more of such opportunities than that, and it is clear from the failure of the early efforts in this kind of building that Vitruvius is out of fashion at this time. A study of the principles of design is particularly necessary for these problems, which therefore bear essentially upon the argument; but the purpose of this article is to advocate the acquisition of familiarity with principles and facility of method for the purposes of ordinary design. All design requires it, the simple as well as the stylish, and the more affectionate adaptation of old work would be better done if the principles at the bottom of the original were open to the designer as well as the result.

Where then are these principles to be found that we may acquire them? That, unfortunately, is the difficulty in the matter. That is the want spoken of above, in the literature of architecture. They exist; there is enough evidence to show that. And the definition of many of them exists, too, scattered here and there through the works of writers on art. Every architect has found out some for himself, and if he turns his attention particularly in that direction will find out more. Gwilt enters into the elusive question of proportion. So do Viollet-le-Duc in his "Lectures on Architecture." One can hardly come out of a study of these investigations without some serviceable addition to method in setting up a design.

## ROBERTSON'S FURNITURE, L<sup>D</sup>. CATHCART, GLASGOW.

THE GLASGOW EXHIBITION BUILDINGS.

It is a year since the Glasgow International Exhibition was opened, and about six months have passed since its gates were finally closed. A goodly part of the buildings, however, still stand, and remind one of the glories of Glasgow's great show of 1901. The *Glasgow Herald* says they form rather a melancholy reminder. Dome and minaret and white walls that shined in the opulent sunshine of last summer bear traces of the unkindlier winter through which we have passed. Not a speck of gilt remains on the domes and minarets, and the white walls are seared and smirched. True, viewed from the heights of Gilmohrhill the graceful lines of the main buildings make still an appeal to the eye; but the condition of the buildings suggests some great palace in decay. The rusty domes, the soiled white of the walls and the faded red of the roofs form a depressing picture. The feeling is pretty general that the buildings have too long encumbered Kelvin-grove. Indeed, complaints have been rife, especially among those to whom Kelvingrove Park offered a short respite to their homes, that there has been undue delay in clearing away the buildings. The inconvenience has been partially removed; at least one pathway through the park—formerly occupied by buildings—having been reopened. Beyond that the casual passer-by may see little indications of the work of demolition. The Sandyford frontage of the buildings is still intact; so also is the imposing elevation within the park. The promenade in front of the grand entrance seems in as good order as when it was thronged with the gay crowds of last summer. That is how the condition of things strikes an observer from the outside, and he is prone to marvel at the delay in razing the "palace." But the hand of the destroyer is very evident within the buildings. If the work of destruction may appear tardy in its progress, it should be collected that the erection of the buildings occupied about a couple of years, and that the work was of no shoddy kind. It is doubtless easier to pull down than to build up; but in such a case as this the process of demolition has to be gone about in an orderly way and with care.

The buildings were handed over by the Exhibition Executive to the parks and galleries committee of the Corporation, and the latter commissioned Mr. James Laird, of Messrs. Laird & Son, auctioneers, West Nile Street, Glasgow, to see to the removal of the structure. A similar task was allotted to Mr. Laird in the case of the first Glasgow Exhibition. Then

he got possession of the buildings in January, and the work of removal was started in that month. In the present case he was unable to get the work properly commenced until little over a month ago. There were several reasons for the delay, not the least being the difficulty of settling the measurements. A start having been made, the work of demolition has been vigorously prosecuted, as an inspection of the interior shows. All the buildings east of the Grand Hall have been taken down. Among the first to go were the picturesque pavilions that formed the Russian village. Their removal was accomplished with a celerity in striking contrast to the leisurely methods with which they were erected. The less ornate pavilion wherein the products of the industrial enterprise of Canada were displayed has also disappeared, as well as the model farm, which stood near it. The "Irish Squireen's House," and the delightful garden that surrounded it, have been swept away. The part of the park where those buildings stood is being rapidly restored to its former state. The grand hall and the restaurant adjoining still stand, reminding one of the luxuries of music and of banqueting that are past. On the hill the restaurants also remain, though the teetotal establishment has been partially removed; and the other buildings where innocuous beverages were dispensed have been entirely demolished. The northern part of the grounds on the eminence overlooking the Kelvin, and popularly known as Machinery Street, has been almost entirely cleared of buildings. The Grand Avenue has been demolished. It was in the neighbourhood of the art galleries, and the ground hereabout is being rapidly cleared, both within the park and on the Dumbarton Road side. Things are so far advanced that within a week or so it is expected that the permanent approach to the galleries from Dumbarton Road will be opened. The bridge leading from the Grand Avenue to the Machinery Hall remains almost intact, and little save the removal of the boiler-sheds has been done within the Machinery Hall. The reason of this is that it has not yet been decided whether the machinery buildings are to be a permanency or not. We may take leave to add that if they are retained, though they may prove useful, they will scarcely add to the architectural features of the neighbourhood. The work of taking down the Industrial Hall is now proceeding. So far the operations are confined to removing the glass in the roof—of itself a big job. Meantime the place has not been robbed quite of its familiar features. The colossal statue of His Majesty the King still stands under the great dome. But the

giant limbs have become badly dilapidated, and the sceptre has got broken. The sitting lions on the piazza also remain, but the dignity of their poise has suffered; they have fallen into an attitude suggestive of anything but the bearing of the monarch of the forest. When the demolition of the Industrial Hall is completed, the work of taking down the outer walls of the main building will be begun. Two or three months will yet pass before the ground approaches its pristine condition. Meantime the building, which but a short year ago was the scene of so much gaiety and social enjoyment, is given over to solitude, and the dust of dissolution clings to every wall.

### SOCIETY OF ENGINEERS.

At a meeting of the Society of Engineers held at the Royal United Service Institution, Whitehall, on Monday evening, May 5, Mr. Percy Griffith, president, in the chair, a paper was read on "Recent Blast Furnace Practice" by Mr. Brierley D. Healey.

The author dealt seriatim with the plant and machinery of an ironworks from the blast furnace to the pig-bed and slag-removal appliances, and drew comparisons between old and new methods of working, showing what great advances had been made during the past forty years in blast-furnace practice. For instance, the average output of British furnaces forty years ago was about 200 tons of pig-iron per week, but now it is not difficult to obtain 200 tons per day, and as much as 305 tons has been smelted in one day, and 1,735 tons in one week at a modern works. The author pointed out that the production of pig-iron in Great Britain in 1901 was 7,385,198 tons, whilst in the United States during the same year it was 15,878,354 tons. In the year 1885 Great Britain produced 7,415,469 tons and the United States 4,044,526 tons.

The author described the latest improvements in blast furnace plant, including the Ford and Moncur and the Stevenson and Evans hot blast stoves; the Giers and Harrison temperature equaliser; the Thwaite-Gardner blast-furnace gas engine and gas treatment plant; the Foster tuyere cooling system; the author's furnace hoist and charging hopper; the Thwaite blast-furnace bell-top; the Hawdon pig-casting machine, and the Dewhurst slag ladle.

He then made some very practical references to the need for utilising the by-products, and particularly to the use of the gases from the blast-furnaces for driving gas-engines for

blowing purposes and for electric lighting and power for the minor machines. He mentioned a case where the gases would not burn in the steam boilers without the help of solid fuel, but which were used in the gas blowing engines at the same work without any difficulty whatever.

The author showed the importance of securing a uniform temperature for the hot-blast by use of equalisers, and of increasing the output of strongly-built existing furnaces by slight alteration of crucible, and an increased volume of blast obtainable from their own gases. He stated that the gas from a 1,500 ton per week furnace working on coke, after allowing seven-twentieths for heating the blast, 900 indicated horse-power for gas-driven blowing engines, and 100 indicated horse-power for charging the furnace and clearing away the slag, left a surplus of 5,000 indicated horse-power for electrical energy. That would be more than sufficient to drive the whole of the machinery of an adjoining steel rolling-mill of equal capacity to the blast furnace output, and also to provide for lighting the works, offices and workshops.

From calculations submitted by the author it was assumed by him that six indicated horse-power per hour was obtainable for every ton of iron produced per week in coke-fed furnaces. From the total power thus ascertained, provision has to be made for heating and compressing the blast and for working the plant, as shown in the 1,500-ton example. He stated that designs were being prepared for the rebuilding of one works in Staffordshire, where a very special feature will be the absence of steam boilers, the power obtainable from the furnace gases being fully utilised.

### THE INSTITUTION OF CIVIL ENGINEERS.

At a special meeting of the above Institution on April 23, Mr. Charles Hawksley, president, in the chair, the tenth "James Forrester" lecture was delivered by Sir William Roberts-Austen, K.C.B., F.R.S., Hon M.Inst.C.E., the subject being "The Relations between Metallurgy and Engineering."

The lecturer stated that this was the subject with which the Council had requested him to deal in his lecture, but it must not for a moment be imagined that the metallurgic art was not included in the wide range covered by the Institution, which had from its earliest days given prominence to the work of metallurgists. It was not easy to fix the period in industrial history at which the metallurgist began to give the engineer

al assistance. If in this country Stonehenge were taken starting-point, the architect-engineer who designed that example of neolithic art could not have received any assistance from the metallurgist. That stately structure arose in the plain at a time when bronze tools were known but not in general use, and this period had recently been traced by Mr. Gowland at about 2000 B.C. In another phase of engineering work it was known that Rome, in the days of her greatness, trusted to the metallurgists of our country to supply the lead which was so extensively used in the City. The fourth-century wrought-iron column, discovered in India, and the girders and beams of the Orissa temple, rendered it necessary to exercise great caution in the period at which iron was used in construction. The magnificent efforts as those given were, however, maintained, and no widespread or continuous records of metallurgists' contributions to early constructive work have been presented. On the other hand, the civil engineer can quote the Charter of the Institution, "advanced metallurgical science and directed the great sources of power in the use and convenience of man," for ages before metallurgists rendered more than incidental service. As the progress of great engineering works into the construction of iron and steel entered, the lecturer referred to and gave illustrations of the primitive cantilever bridges of pine trees across mountain torrents in Savoy. The interesting fourteenth-century cantilever bridge made up of 20-foot beams in the note-book of Villars de Honnecourt was also mentioned, as was a bascule bridge of the Middle Ages. The bridge of Milan Cathedral, as designed by Leonardo da Vinci, the great Tuscan painter, engineer and architect, was also mentioned as an example of a structure in which metal was not used. The employment of cast-iron from the time of Queen Elizabeth to the present day was then dealt with, and the progress of cast-iron bridge of 600 feet single span, by Telford and others, was referred to, and it was pointed out that in the nineteenth century metallurgists, by creating the age of steel, had atoned for their somewhat tardy and intermittent use of iron to supply engineers with suitable materials. As regards the use of cast-iron and malleable iron, the progress of Watt in developing the steam-engine was traced, and it was admitted that the necessity for pumping water out of the cylinders was the main factor in the evolution of the steam-engine, and in turn the development of British metallurgy of iron and steel dated from the time when the steam-engine of

Watt enabled air to be readily pumped into the blast-furnace employed for the production of cast-iron. It was then pointed out that more than half of the last century had elapsed before the "age of steel" began, and that towards the end of the century great attention was devoted to considerations connected with the molecular structure and properties of steel, and to enforcing the action of carbon, the element which gave steel its properties, by the addition of other elements than carbon in very small proportions. With regard to the slow growth of confidence in the qualities of steel, the opinion of successive Presidents of the Institution, as expressed in their Addresses, was quoted; Sir John Hawkshaw, Sir John Fowler, Sir Frederick Bramwell, Mr. W. H. Barlow, Lord Armstrong and Sir George Bruce being specially alluded to. In 1887, when Sir George Bruce delivered his address, the merits of steel had at last received recognition, and as regards the crowning triumph of the age of steel—the Forth Bridge—Sir George exultingly exclaimed:—"At the Menai Bridge the total quantity of iron was 11,468 tons; at the Forth Bridge there will be 50,000 tons of steel and iron." No one had done more than Sir Benjamin Baker to insist on the importance of phenomena which engineers used to consider "mysterious" in connection with the behaviour of steel, and his warnings and example were at last being regarded and followed. The lecturer pointed out that when metallurgists gave engineers mild steel they provided a cinder-free solid solution of iron and carbon. All subsequent advance had been due to the recognition of this fact, and to the gradual study of the properties of metallic solid solutions. Sir John Hawkshaw, in his presidential address to the Institution, delivered in 1862, had said that if the strength of iron could be doubled, the advantages might be equal to the discovery of a new metal more valuable than iron had ever been. The lecturer contended that this was exactly what metallurgists had done with regard to steel. By suitable thermal treatment and by suitable additions of comparatively rare metals, they had doubled the strength of steel as it was known in its early days. The nature of solid solutions was then explained and the importance of allotropic modifications of iron was dwelt upon, this portion of the subject being illustrated by some difficult experiments. The question was then asked, Could the past molecular history of a mass of steel be traced by microscopic examination of the solid metal? Some very beautiful experiments by M. Osmond, Mr. Stead and others, were appealed to in evidence of the possibility of this. It was then demonstrated that solid metals might even reveal, by their structure, the

vibrations to which they had been subjected, and Sir Benjamin Baker had constantly insisted on the importance of such vibrations. In making this clear, Vincent's experiments on the beautiful wave-structure that might be imparted to the surface of mercury by the aid of a vibrating tuning-fork were then exhibited, and it was demonstrated that the surface of solid lead which had been subjected to similar vibrations, possessed a similar structure to the vibrating surface of mercury.

Finally, with regard to the efforts metallurgists were making to study the influence of rare metals on iron and other metals, the reducing power of aluminium on metallic oxides was shown. Very high temperatures of 3,000 degs. C. and over were attained, and brilliant light was produced during the reduction of chromium, cobalt, nickel and other metals from their oxides.

In conclusion, the lecturer appealed to the new Alexander III. Bridge at Paris as showing the need for the careful measurement of high temperatures in connection with the treatment of large masses of steel. In the construction of the bridge 2,200 tons of cast steel had been employed, and a peculiar molecular structure was imparted to the steel by rapidly cooling it in air from a temperature of 1,000 degs. C. to 600 degs. C; this gave the metal certain mechanical properties which it would not otherwise have possessed. With reference to the aid given by metallurgists to engineers in connection with ordnance, reference was made to the address delivered by Mr. T. Hawksley, the father of the President, in 1872. He said that "In no way" other than by the study of such questions "could the Institution" of Civil Engineers "serve its country better, or better promote in the interests of peace, the advancement of practical science, and its application, if events should order, to the purposes of protective warfare." The use of copper, aluminium and other metals in electrical engineering was referred to, and the lecture ended with an appeal for the more extended study of the physical properties of metals.

At the annual meeting of the Institution of Civil Engineers, held on Tuesday evening, Mr. Charles Hawksley, president, in the chair, the result of the ballot for the election of officers was declared as follows:—President, Mr. J. C. Hawksley, M.A.; vice-presidents, Sir William White, K.C.B., Mr. F. W. Webb, Sir Guilford Molesworth, K.C.I.E., and Sir Alexander Binnie; other members of the Council, Mr. J. Barton (Dundalk), Mr. H. Bell, Mr. B. H. Blyth (Edinburgh), Mr. C. A. Brereton, Mr. J. Brown (Cape Town), Mr. R. E. Cooper, Colonel R. E. B. Crompton, Mr. C. W. Darley, Mr.

Upcott, C.S.I., Sir Leader Williams (Manchester).

## NEW INDUSTRIAL SCHOOL AT PORTSLADE

THE substantial pile of buildings at Portslade which have erected by the London and Brighton School Boards at a cost of upwards of 30,000*l.* as an industrial school is now nearing completion, and will, according to present arrangements, be opened by Lord Reay on the 14th of next month.

These new buildings, which front the rural road which leads from Upper Portslade to Mile Oak, occupy an elevated situation and command splendid views of the surrounding country. They are in red brick and surround a large quadrangle, which is asphalted, 140 feet long by close on 120 wide, and upon which open the doors of most of the principal departments of the school. It will be used as a playground, drill-ground, &c. As far as the position of the main building is concerned, it might be more correct to describe it as shaped like a rather wide letter H, for the buildings round the north half of the central quadrangle, which are limited to one floor, chiefly consist of the offices and workshops. The main entrance to the school, a doorway of mixed classical design, approached by a short flight of stone steps, faces south in the middle of the crosspiece of the H, the two lower limbs of which represent short south wings, comprising, on the ground floor, the dining-hall and a schoolroom, and on the upper floor, a couple of large dormitories. There are altogether four large dormitories and one small one. Adjoining each of them is a bedroom of an assistant master, who is able, by means of a small glazed shutter in a corner of his room, to keep an eye on the proceedings in the dormitory. As many as 120 boys can be accommodated at the school.

Immediately to the right of the main entrance are the superintendent's quarters in what is practically a separate house. Though included in the main block of the school buildings, and communicating with the school on each of

Circus, London, E.C.

ors, these quarters are quite separate so far as privacy is  
ned.  
the left of the main entrance is the greater part of the  
residential portions of the school. These comprise  
rooms for the male and female teachers and bedrooms.  
ady teachers, by the way, have all their apartments  
ctly together. The school also includes an infirmary  
fine southern outlook, an isolation dormitory and a  
room for the resident nurse. Water is laid on to the  
building from the Brighton Corporation mains, and there  
ndant lavatory and bathroom accommodation. As a  
tion against infection, the boys' lavatories are not  
ed with basins, but the water, hot or cold, is run on from  
ber of sprays, the waste being immediately carried away  
nnels underneath. Another important feature is the  
ing bath, a handsome little bath, 40 feet by 20 feet,  
ed with white tiles, and ranging from a depth of 3 feet  
es to 5 feet 6 inches. In connection with the water  
may be mentioned the boiler-house. The boilers,  
have been tested during this week, will do all the work  
ting the baths, cooking and working the machinery of  
ool laundry, which is of a very up-to-date pattern. The  
ooms, sitting-rooms, &c., will be heated with stoves, and  
ole school buildings will be lighted with gas from the  
mpany's mains.

## NATIONAL REGISTRATION OF PLUMBERS.

annual meeting of the District Council of the National  
ration of Plumbers for Edinburgh and the East of Scot-  
as held in Dowell's Rooms, George Street, Edinburgh,  
1st inst., Sir James Russell, the honorary president, in  
air. Mr. James Marchbank, S.S.C., the secretary, sub-  
the annual report, from which it appeared that the  
il were hopeful that the Plumbers' Registration Bill  
be passed through Parliament before the end of this  
a. The report of the treasurer, Mr. John K. Paterson,  
etires at this time, showed a balance at the credit of the  
il of 33*l.* 2*s* 9*d.* The Chairman, in moving the adoption  
reports, after referring to the loss the Council had  
by the death of Councillor Pollard, the president and  
J. J. Henderson, secretary of the Dundee district com-  
said he thought the Council were likely to be correct  
forecast about the passing of the Plumbers' Registra-

tion Bill, a measure which was not merely for the benefit of the  
plumbers, but for the benefit of the public health. How the  
Bill had been opposed so long he could hardly understand.  
It showed how self-interest, and perhaps vested in-  
terest, was called forth to do wrong to the country.  
It looked as if some people opposed this Bill because  
they were afraid they would be relegated to a second  
place in the eyes of the public by the mere hall-marking of  
other people. After all, the Bill consisted simply of one thing  
that no man might call himself a registered plumber unless he  
was a registered plumber. He hoped Parliament, in its  
wisdom, might see that it was in the interests of the nation  
and in the interests of the public health to disregard any  
opposition to the measure which might be made before its  
final passage. Councillor Purves, in seconding, remarked that  
while they might not be a very large body, they were a deter-  
mined body. They had gone on steadfastly fighting this  
registration movement, and they had now come to a point  
where they thought Parliament's recognition was assured.  
The Bill had passed its second reading, and they only required  
to stand steadfastly together and show that they were working  
for the public benefit and for that alone. They had no selfish  
object, and were pursuing no course of self-aggrandisement.  
It was recognised that the trade they pursued rendered it  
absolutely necessary that the work entrusted to them should  
be carried out in an efficient manner. The reports were  
adopted. Sir James Russell was re-elected hon. president,  
Councillor Lang Todd was appointed president; Councillor  
Purves, vice-president; Mr. James Marchbank, S.S.C., secre-  
tary; and Mr. J. K. Rutherford, jun., treasurer.

## ELECTRICAL ENTERPRISE.

The committee appointed by the Institution of Electrical  
Engineers to hold an inquiry on electrical legislation have  
issued their report.

The committee met on eleven occasions and heard the  
evidence of a number of representative experts. The witnesses  
were practically unanimous in their conviction that electrical  
enterprise had not attained its due position in this country.  
A joint select committee of the two Houses of Parliament in  
1898 reported that the law should be amended as regards the  
veto exercised by local authorities, but no steps have been  
taken to give effect to that recommendation. The opinions of

the committee are embodied in resolutions to the effect that, notwithstanding that our countrymen have been among the first in inventive genius in electrical science, its development in the United Kingdom is in a backward condition as compared with other countries, that the cause of such backwardness is especially due to the restrictive character of the legislation governing the initiation and development of electric power and traction undertakings, and the powers of obstruction granted to local authorities; that local boundaries have usually no reference whatever to the needs of the community in regard to electric supply and traction, and that the selection of suitable areas should be dealt with on the basis of economic principles and industrial demands; that the development of electric power and traction undertakings offers the most favourable means of relieving congested centres; that it is expedient in the national interests that the Electric Lighting Acts, 1882-88, the Tramways Act, 1870, and the Standing Orders relating to special Acts for tramways should be amended in so far as they enable local authorities to veto or delay the carrying out of electric supply and traction projects of which the utility can be shown, and that effect should be given to the recommendations of the Joint Select Committee of Parliament, 1898, on "Electrical Energy—Generating Stations and Supply;" that while this committee fully recognises the ability of the technical officials of the Government Departments concerned, it is of opinion that the staffs of those Departments, as at present existing, are wholly inadequate having regard to the great industrial interests involved, and that it is essential that these Departments should be put into a position enabling them to keep in touch with all developments in engineering matters, both in this country and abroad, and that a sufficient sum should be provided annually by Government to enable them to employ and pay a proper staff for such purposes; that the adjustment of departmental regulations to engineering development should not be delayed until the industrial interests concerned are seriously hampered, and that, with a view to preventing any such delay, the Institution of Electrical Engineers should be willing to take part in revising such regulations from time to time; that this committee recommends that the Institution should memorialise the Prime Minister to receive a deputation for the purpose of urging the removal of the present disabilities and restrictions which prevent electrical engineering from making the progress that the national interests demand, and attaining at least the same level as in America, Germany and other industrial countries.

### THE PROPOSED BANGOUR ASYLUM.

THE special committee of the Edinburgh District Lunacy Board appointed to consider the Bangour Asylum scheme have prepared their report. The report mentions that the committee, besides visiting various asylums, had consulted outside parties, such as Mr. George T. Hine, architect, London, the well-known authority on asylum construction, and the Commissioners in Lunacy for Scotland and England. The Bangour (861 acres) was purchased in 1897 for 13,000*l.*, and was necessary to acquire certain other items, bringing the total up to 21,455*l.*, and the acreage up to 922. There was no wonder that difficulty after difficulty had arisen as to how to properly adapt and utilise the purchase. The difficulty in finding a site for the buildings was so great that the chosen was the best piece of arable land on the property, and the Board's valuator had deducted 225*l.* from the farm rent of 550*l.* for 187 acres required for the site, leaving 325*l.* as rent for the remaining 674, or equal to 9*s.* 8*d.* per acre. Groutlays would be entailed for excavations, retaining walls, a foundation under building, and the foundation would be of an unusually expensive character. On July 27, 1898, Mr. Hippolyte Blanc was appointed architect, and the estimate he submitted was for an asylum for 600 patients, 173,537*l.*, and 61,720*l.* additional for 1,000 patients, or a total of 235,257*l.* Messrs. Lawrence & Co. in July 1898 reported on the probable cost of nine designs submitted in competition by architects, and stated that the probable cost of Mr. Blanc's scheme, according to the calculation, was 291,453*l.*, as against the architect's estimate of 173,537*l.* for 600 patients. Before the architect was appointed it was thus evident that on the surveyor's estimates the Board was face to face with a scheme which, if not modified, would involve for buildings alone for 1,000 patients 400,000*l.* thereby. The architect, according to the minutes, was newly instructed as to the cost his plans must not exceed. In November 1898, on the recommendation of the architect, it was agreed to construct a railway, which it was estimated would save in cartage of material therefrom, which, including payments to the Road Trustees for exceptional traffic and the extra cost of maintaining private roads during building operations, he estimated at 22,000*l.*, and later 31,000*l.*

The report states that owing to the hilly nature of the selected site at Bangour, it would be a very expensive one for building, &c.; taking into account the difficulty in finding within its limits satisfactory foundations, a change of site was suggested as desirable. It was to be regretted that no site

pointed out which would be thoroughly suitable, the estate being hilly and damp. The committee admired the excellent plans and arrangements of the asylum, they were decidedly of the opinion that they were prepared on a scale much more costly than any lunacy board should authorise. To put down the cost of the present designs in items here and there would not be effective if it was absolutely imperative that a radical change of elevations and specifications should take place. The committee recommended that brick harled be mainly used in the construction of the asylum. The carpenterwork could in many places be modified. Plaster-moulded arches and panelled ceilings, beams and cornices should be dispensed with. In the interior, marble divisions and gunmetal fittings were not necessary. There was throughout a lavish use of glazed bricks and tiles. It appeared extravagant to put in a cottage with a chimney at 17. per superficial yard. There was no department where economy could not be practised. The homes should not cost more than 100. per bed, including branch roads and pipes, electric wiring, grates and painting. Objection was made to the size of the recreation-hall, and the committee recommended that the superintendent's house should cost no more than 4000. There was no need, in the opinion of the committee, for the mortuary being an elaborate building. It was recommended, the committee state, that their examination had been allowed to proceed before the cost of preparing the plan was incurred, as this expense was absolutely of no value in connection with the proposed reduction. In connection with the contracts the committee recommended that the buildings be grouped into several divisions, and that the schedules be prepared on this footing, and estimated for each group, and not block by block only. Summarising the results of their inquiry, the committee recommended that the total cost of the asylum for 1,000 patients, including interest during construction, should not exceed 400,000. Instead of 642. per bed, which they believe would be reached under the present scheme. The following are the recommendations:—(1) The daily supply to be reduced from 100 gallons to 60 gallons per bed; (2) the Board to consider the question of change of the higher plateau north of Bangour Knowes; (3) the buildings to be mainly erected of brick harled and otherwise of good material from the estate; (4) the size of some of the buildings to be reduced, such as workshops, recreation-hall and medical

superintendent's house; (5) the homes to be enlarged to hold sixty patients and to be fewer in number, the whole to be erected for 100. per bed; (6) group the building contracts into sections; (7) while retaining most of the arrangements as shown on plans, a number of alterations are required. All the elevations and sections must be redesigned, the specifications greatly modified and the schedules prepared anew, in order that the buildings and their furnishings, &c., in place of costing 446,000., shall cost 250,000.

In concluding their report, the committee say that in submitting their report and recommendations they had only to add that in proposing an approximate saving of 240,000. they had kept steadily in view the erection of an asylum substantial in its structure and adequate in its equipment.

### THE SUN-DIAL.

Of all ancient inventions there is none more interesting than that of the sun-dial. We read in the thirty-second chapter of Second Chronicles that when Hezekiah was sick he prayed to the Lord, and "He gave him a sign;" what that sign was is particularly told in Isaiah, chapter thirty-eight, verse 8: "Behold, I will bring again the shadow of the degrees, which is gone down in the sun-dial of Ahaz, ten degrees backward. So the sun returned ten degrees, by which degrees it was gone down." This was about 700 years before the Christian era. The Chaldeans were among the earliest astronomers, and the first of all sun-dials of which we have any certain knowledge was the hemicycle or hemisphere of their astronomer Berosus, who probably lived about 540 years B.C. It was a concave hemisphere, similar to a basin, with the hour lines traced on its concave surface, and a globule suspended or fixed in any way at its centre cast the shadow. This was the most simple and natural of all sun-dials, and therefore must have preceded the others. It, however, required no mathematical theory for its construction; a distinct notion of the spherical motion of the heavens was sufficient. The hours indicated by this dial were from its nature unequal, and varied from day to day. This defect was not of much consequence when there were no machines for dividing time; a knowledge of geometry would have served to construct the dial so as to divide time equally, but at that remote period geometry was not known to science.

It is doubtful whether the Chaldeans had any mathematical theory for their dial, although it was of great simplicity. The

SILICATE PAINT CO., J. B. ORR & CO., Ltd., CHARLTON, LONDON, S.E.

facility, however, of its construction has probably made it the best known. Four have in modern times been recovered in Italy; one was discovered in the year 1746 at Tivoli. It has been supposed that this belonged to Cicero, who in one of his letters says that he had sent a dial of this kind to his villa near Tusculum.

We have so far treated of the earliest form of sun-dial, and may now take a modern one made by the old-established firm, Messrs. Francis Barker & Son, 12 Clerkenwell Road, London. This firm have constructed some elegantly-designed sun-dials suitable for any architect to place in grounds or on new buildings which he may be designing. One of their latest

examples is a horizontal one called the "Coronation" dial. It was designed to commemorate the coronation of King Edward VII., and is remarkable for design, engraving and finish. It is shown in the accompanying illustration, and is of particular interest, being an unique specimen. One can see at a glance the time at London, Cape Town, Montreal and Melbourne. The equatorial plate is arranged in columns, the spaces between which are filled with flowers appropriate to each month of the year, and outside this table there is a border of scroll-work. If desired, in place of this a motto can be graved.

Messrs. F. Barker & Son's new illustrated sun-dial list is well worth perusing; copies will, we understand, be sent to any of our readers on application.

Another dial which came under our notice was one giving the time of the place where it is fixed, and engraved on the plate around the centre were thirty-two principal cities of the world, with their latitude, longitude and the difference of time between the place where the dial is placed and each city.

#### EXTENSION OF CORPORATION STREET, BIRMINGHAM.

THE estates committee of the Birmingham Corporation have prepared a report on the proposed extension of Corporation Street. Concerning the improvement, the Town Clerk in January last year said that the Corporation, having acquired the whole of the lands for the execution of a definite scheme, the Corporation are under the obligation to carry the whole into effect as soon as practicable, unless the scheme be modified by

a provisional order of the Local Government Board duly affirmed by Parliament. If such modification be obtainable, considerable financial adjustment will be necessary. The subject of the extension of the street was also pressed on the attention of the committee in connection with objections to the renewal of a number of licenses, seven of which are on the area affected by the proposal. The committee report details of negotiations with the Birmingham Property Company respecting the transfer to it of certain licenses. The committee have at present in hand fifteen licensed houses, including a group of houses to be leased to the Property Company for twenty-one years with the option of surrendering them on payment to the Corporation of the following sums in respect of them:—King's Prussia, Newton Street, 800*l.*; Racquet Court, Bath Street, 900*l.*; Rose and Crown, Weaman Street, 400*l.*; Coal I. Tavern, Loveday Street, 300*l.*; Anchor, John Street, 1,000*l.* and the Stores, Lower Priory, 400*l.* The committee have agreed to a lease of five other houses—the Black Horse, Britannia, Cooper's Arms, Dog and Pheasant, and Horse Jockey, with power to surrender, on the justices allowing substitution of two new licensed houses, to be built on the site leased to the Property Company on the line of the Corporation Street extension. The latter condition necessitated the question of the extension being now decided. The committee urge that such extension is further necessary for the purpose of opening up the district and remedying its sanitary defects. The estimated cost of constructing the street is 13,000*l.*, and will involve the demolition of buildings from which there will be a loss of rental of about 1,200*l.* per annum. The widening of the canal bridge in Aston Road will cost about 1,200*l.*, and the committee put the entire cost of the scheme for interest and sinking fund at 1,873*l.* per annum, which will be reduced year by year by enhanced rental receivable until it falls to 1,082*l.* in the eleventh year from the formation of the street, 555*l.* in the seventeenth, and 116*l.* in the twenty-second and following years till the expiry of the loan. In their general estimates of the improvement scheme for the current year the committee record that 13,000*l.* would have been a sufficient contribution from the rates but for the circumstance that the Local Government Board have intimated that they will no longer allow sinking funds on loans to be accumulated on a higher basis than 3 per cent. This character involves the necessity of asking for an additional sum of 1,700*l.*

## THE WEEK.

London County Council on Tuesday voted for the sum of 3,500*l.* for the decoration and illumination of Westminster and Waterloo Bridges and the Thames Embankment and Embankment gardens. The sum considered large, especially when it is in connection with the national rejoicing at the Coronation. What will be held to be the most notable part of the project is the decoration of Westminster Bridge by the students of the Royal College of Art, South Kensington. They have proposed to set up along each side of the bridge busts of the kings and queens of England, those of VICTORIA and Queen ELIZABETH occupying the central positions. The busts are to be placed upon pedestals of foliage hung from poles. The students intend to supply the models, together with shields and other emblems which will be fixed to the pedestals. The Council will have to arrange for the provision of the pedestals and for the provision of the festoons, as well as for casting the models. The expense of realising the students' plans will be more than 500*l.*, and the ratepayers are not likely to be attracted to the patronage of art on so modest a scale. It is remembered that the students of the college gave to the celebration of the relief of Mafeking, and it is hoped to encourage them in their manifestations of interest in art affairs, from which unfortunately art and artists have hitherto kept away.

A DECISION given by Judge COVENTRY in the Lancaster County Court differs from the precedents relating to the measurement of the height of a building. According to the Workmen's Compensation Act there are two classes of buildings within the Act. One consists of buildings exceeding in height which are either being constructed or are being erected by means of a scaffolding. The limits which are to be taken for the measurements are not announced, and the court has to discover them as it has given employment to judges in the past. In the Court of Appeal the decision given in *WYATT v. NEWTON, CHAMBERS & Co.*, viz. that the height is to be taken to the top of the roof, was affirmed. In the London Building Act height means the height taken from the level of the footway in front of the face of the building, or from the level of the ground before excavation to the level of the top of the external wall, or the base of the external wall. External and party walls are to be measured from the base of the wall to the top of the topmost storey. Judge COVENTRY has gone a step further, for he has decided that the measurement is to be taken to the top of the roof if it should be higher than the roof. In the case of *WYATT v. NEWTON* it was argued that as the building was not within the Workmen's Compensation Act did not matter, but by taking the measurement to the summit of the roof the height became 31 feet, and the employer of the workman was held to be responsible.

ELECTRIC traction seems to be making its way in London. Arrangements are now being concluded for it to be run on steam on the line of railway between Athens and Piræus. It is expected that trains will be able to run between the city and the port every quarter of an hour. The electric power will be generated at the new electric station which will shortly be completed at New Phalerum, and the preparations are being made for the installation of machinery which will collectively have some 7,000 horse-power. This station will also supply the electric light for the city and Piræus. Prior to the Persian wars there was a harbour for Athens, which was called the Piræus. THEMISTOCLES was the first to recognise the advantages offered by Piræus, and Phalerum, of which the Piræus is not quite certain, subsequently was disused. The Piræus and the Piræus were connected by a line of walls which was the great carriage road. The town of Athens was laid out by HIPPODAMUS, of Miletus, with straight streets crossing each other at right angles. The Piræus was quite unlike the crooked and narrow streets of

Athens, which amazed visitors by their meanness. He also erected a market, which, in consequence, was always known as the Hippodamia. According to an inscription, a part of the portico was used to preserve archives. The market must at one time have presented a most picturesque appearance, for the productions of every country known to the Greeks were gathered there, and it was stated to be the general emporium of all Greece. Beside the market was a theatre, and a tablet has been found which recorded that a crown had been awarded to CALACRATIDE for having raised the prices of the seats—a novel kind of service to render. HIPPODAMUS also formed five porticoes in connection with one another near the sea. They constituted "the long portico," and served as a bazaar for goods which had to be sold when removed from the vessels. The five porticoes had a temple at one end and a tribunal at the other, which corresponded with our Admiralty Court. HIPPODAMUS, as became an architect, appears to have been in favour of progress, and who knows whether his ghost may not rejoice at the utilisation of electric power for the benefit of Athens and Piræus?

THE late CHARLES EDWARD DAVIS was so prominent in Bath after forty years' service, his death on Saturday last from bronchitis must leave a void which will be perceptible. In other English towns and cities there was no architect or surveyor who exercised so much dominion. At one time collisions between himself and some of the members of the Corporation were constant, and whenever he was defeated it was by numbers rather than by argument. Since, however, the acceptance of the design of the late Mr. BRYDON for the reconstruction of the public buildings his combativeness was subdued. He had set his heart on accomplishing that work, and it could not be said he was fairly treated when he found himself superseded. His services were manifold, and it was through his explorations that Bath was revealed as an important Roman city. All the world knew about the connection of the Romans with that station, but it was not demonstrated how highly it was valued. It was no easy work to trace out baths and underground arrangements through a dense soil in which water seemed to be percolating all round. But having taken up the investigation CHARLES DAVIS stuck to it with amazing pertinacity, regardless of the indifference of those who should have most earnestly supported him. Nor was he only concerned in archæology. It was through his energy the baths for invalids became comparable with those in the most frequented health resorts on the Continent. He did not confine himself to municipal works; he was the architect for several private buildings in the city and in other places, but his name will be always associated with improvements which testify that Bath merits its name.

THE Uganda Railway has claimed its victim, for it has caused the death of Mr. BAASS, the superintending engineer, in his forty-first year. A trolley in which he was travelling came into collision with an engine at the Lumbwa station, and from the injuries he sustained Mr. BAASS died three hours afterwards. In his report to the Foreign Office Mr. RAWSON, chief engineer, writes:—"I need hardly say how deeply the death of so respected and popular an officer as Mr. BAASS is regretted by all the members of the staff of the railway. He was one of the first party of engineers who arrived in this country in December 1895, and the services he has rendered towards its completion are too well known to the committee to render it necessary for me to recapitulate them here. Beyond two short periods of leave he has worked continuously for upwards of six years, and his death, coming at the very termination of his engagement with the railway, is much to be deplored. By it I lose an officer who has always rendered me the very greatest assistance, and one whose zeal and ability it would be difficult to over-estimate." Although a young man, his experience was varied. He was for several years employed on road, water and railway works throughout Australia. Seven years ago he went to Mombasa, and having completed the operations for which he was engaged, he was asked to remain for a longer time. He was about to return to England, after his supplementary service, when he met with his fatal accident.

## THE NEW GALLERY.

THE exhibitions of the New Gallery are supposed to be a continuation of those in the Grosvenor Gallery, or, in other words, they give opportunities to display a departure from the beaten tracks of painting, of which the goal is the Academy. We all know there are artists who are born innovators and, regardless of the sacrifices they may be compelled to make, must be faithful to what they consider as inspirations. For them the Grosvenor Gallery seemed to be a fostering power. There are other men of a plastic nature who, without having any peculiar way of representing life, find little difficulty in the imitation of what is novel in other representations. In the present exhibition of the New Gallery the second class is more largely installed than the first.

All lovers of art must rejoice to see no diminution of power in the vigorous hand of Mr. G. F. WATTS, who is the principal survivor of the revolution. His *Love Steering the Boat of Humanity* recalls TITIAN by the modelling, the waving scarfs of red and yellow, the great billows, and by the simplicity of the composition. It is an allegory which all can understand. His *Sunset in Surrey* has also the breadth which characterises Titianesque landscapes. It is easy to trace Mr. WATTS's influence in the *Cider Press* of Mr. FRANK BRANGWYN. The spirit of the operations is suggested not merely by the figures of labourers, or the nude children, but by the richness of the colouring and the abundance of fruit which is scattered around. It is not a picture that is adapted for reproduction in a Guide to the Orchard, but it serves to reveal the poetry of one British industry. The picture is also remarkable as another effort of Mr. BRANGWYN to try his power in a variety of tests, and its completeness is as satisfactory as any of his scenes on sea or in Moorish towns. Mr. WATTS could also claim to have a lien on the *Haymakers* of Mr. T. AUSTEN BROWN. The subject has been treated by countless painters, but here we have a largeness of style which is not usual. The intensity of the colouring should also be recognised. There are only two figures of a man and a woman, but they are as expressive of operations in summer as would be a dozen figures dispersed over a field.

There are other pictures in which we can trace an indebtedness to Mr. WATTS. Several are also reminiscent of pioneers who have passed away, the late Sir E. BURNE-JONES being one of the most influential. It must be said that the works by those who would claim to be his disciples are wanting in many of the qualities which redeemed that artist's numerous shortcomings. Attempts to treat scenes in the style of primitive artists are also common. All those works now excite a sense of insincerity on the part of the artists who produce them, for it is not possible to look on life in the same way as men who existed four or five centuries ago. That assurance of encountering an excess of imitativeness we believe to be one of the causes of the growing indifference to the exhibition. The ordinary visitor has discovered that borrowed styles are as absurd as borrowed plumes.

In the rooms there are however many works which deserve attention. The dozen of examples which are painted in tempera form an interesting experiment, especially as a demonstration of finesse. Among them Mr. J. D. BATTEN's *Danae and the Shower of Gold*, an effort to treat a myth in a style that cannot shock the modest; Mrs. STOKES's *Snowdrop*, an illustration of the fairy tale depicting the princess in her glass coffin and lamented by gnomes, not altogether Germanic in type, and her *Franciscan Scholars*; Mr. WALTER CRANE's *The Wind in the Trees*, an allegory in a decorative spirit showing how all the winds of the world play upon the one of love; and Mr. HENRY RYLAND's *Oleander* are the most successful. Mr. SOUTHALL's *St. Dorothea*, another of the series, is spoiled by its excess of archaicism.

The portrait of *Professor G. D. Liveing*, by Sir GEORGE REID, P.R.S.A., gives an impression of being characteristic; but, like the portrait of a Professor which was seen a couple of years ago at the Academy, it suggests a suspicion of students. The portrait by the same artist of Sir JOSEPH W. PEASE is, however, of a manly man of English type. Mr. SHANNON's *Mrs. Neligan* is painted in a quiet manner that suits the subject. His bravura effects

are rightly reserved for younger sitters, like his *Lady*, who is shown against a boldly ornamented curtain background, and *Miss Dorothy Chambers*, who seems a flower queen. Mr. JAMES CHARLES, in *A Pastoral*, utilises the luxuriant gorse which is found in parts of the county. In *The Pool*, by Mr. W. H. BARNES, children are bathing on a bright day. His *Pollock off Arranmore, co. Donegal*, is a scene of a dramatic character which he has already made familiar, for it depicts toil-worn Irishwomen who are carrying loads on the coast that is marked by savage beauty. *The Wild Trees*, by Mr. ADRIAN STOKES, is a bold attempt to sent what at first sight looks like a revolt against the organic system followed by nature. *The Dancing Lesson*, by W. H. BYLES, is a classic scene showing Greek girls on a terrace, and is graceful throughout without any artificial logical pedantry. Lovers of English literature will be attracted by Mrs. STILLMAN's *In the Garden of the Landor, Florence*, although it is amateurish in parts. A great writer believed it was the place where BOCCACCIO told his famous stories. Her *St. Francis Blessing the Pigeons* has *Liberated* is at least pleasing in sentiment, but a common error has been made of clothing the saint in a brown habit. Originally grey was the colour of the Order. Mr. FRANK DILLON's *Sphinx* at *Midnight* supports the argument of those who believe that the ruin is not fit to be portrayed under a garish eye, and a lighted fire at the side indicates the mystery of the colossal form, and dispels the monotony of the desert. The *Lamia* of Mr. C. F. M. CLEGG recalls KEATS's poem, for the unhappy being crouches on the ground, and in her robes the colours of the serpent's skin have been utilised. *Mount St. Michel*, by Mr. DONALDSON, is a careful representation of a view in art and nature have been happily combined. Mr. EDWARD PARTON, in *The Tangled Wild Wood*, introduces trees that may be called delicate, and almost every inch has a special character.

Mr. HERBERT DRAPER has for once abandoned his favourite water-nymphs in his *Midsummer Night*. A modern cart would by itself suggest a transcript from a book, but near it PUCK is seated. A little more and the picture would serve as an illustration of the sprite's words, "with weary task foredone." Mr. BERNARD F. GRIBBLE has also changed his subjects, and his *A Good Day for a Turn* is an eighteenth-century scene with two equestrians, a lady, and a gentleman, in a wood. The expression on the lady's face is not altogether satisfactory. Mr. C. E. HALL is a careful painter, and his three pictures emblematic of a woman's life will no doubt be popular, but the excessive labour mars their effect as works of art. We prefer *Water Carrier*, which is a brilliant canvas. It is necessary to say that Mr. REGINALD BARRATT's *Cornfield* at *St. Mark's, Venice*, shows an appreciation of detail which is not customary in views of the famous building. *The Lock* is so effective as a faithful transcript from nature, that, in fact, so full of CONSTABLE's spirit, it will excite doubt whether Mr. JAMES ORROCK has acted wisely in devoting so many years to the production of small drawings and pictures, although they are of such excellent quality. There is no faddism or attempt to make nature an ornament or a wailer, and on that account it almost seems out of place in the room. *Between Summer and Autumn*, by MISS MOFFAT LINDNER, shows some daring; the work does up to the title, although in parts spottiness has been carried to excess. *The Cobweb—Hesitation*, by Mr. C. E. PERUZZI, as usual with the artist, shows a scene so spick and span that seems improbable that a spider would select such a place and paling as auxiliaries to a trap for flies. Why does a girl hesitate? Is it through womanly fear of a spider? Apprehension that her passing outside will be detected? Mr. COUTTS MICHIE has a vigorous portrait of Sir JAMIN BAKER, but the designer of the Forth Bridge may well be contented with everyday dress, and leave red robes to aldermen and others who need trappings to gain distinction. *Salomé*, by M. BENJAMIN CONSTANT, is of a more savage than is usually selected, although French painters are partial to the subject. She is no more than a barbarian with fiercer eyes than are seen in a tiger's head, and such a woman would have no qualms in serving as an office of executioner. Sir J. D. LINTON in *The Vision* shows

who is engaged on a picture of the Madonna and when a vision appears before him. The expression is effec-  
 ficient, while the robes and drapery have the richness  
 ment which is only found in Venetian pictures.  
 the North Gallery. *Dear Lady Disdain*, by Mr.  
 COLLIER, is an attempt to realise SHAKESPEARE'S  
 CE; the dress is rich green, with sleeves em-  
 ed in gold and a red mantle. She carries a fan of  
 feathers in her hand. It is not an easy task to  
 ke, for everyone has his own ideal of the characters  
 dramas, and in this case the figure seems to be less of  
 on than a portrait of a lady. Mr. G. P. JACOMB-  
 shows a Satyr's family, the children dancing to the  
 which the father plays on a pipe; it is a joyous scene,  
 e more welcome because humour in every form is  
 d from the gallery. Is the perpetuation of the frailties  
 at man becoming in a painter? Mr. H. SCHMALZ  
 St. AUGUSTINE exhausted by debauch lying on a  
 whilst his mother is wrapt in prayer at his feet. There  
 outh the saint wrote a book of confessions, but men  
 lass are disposed to exaggerate the misdeeds of their  
 and the saint may not have been as black as he  
 himself. Besides, an artist should remember that  
 TINE wrote a large treatise on beauty, which at one  
 appears to have been valued. *The Decadence of the*  
 s was painted by COUTURE as much from a desire to  
 against Imperialism as from any other cause, but to  
 uth, intellect and genius stretched brutally on a  
 is not an edifying spectacle, especially when we  
 at the Christian bishop atoned for the defects of the  
 student. Mr. ALFRED EAST'S *Morning Song* is a  
 pe with bare trees, and having the subdued tones  
 re characteristic of his style. The *Fra Angelico* of  
 INDOR FRY is a subject which has been several  
 ainted. In this case the Dominican artist is sup-  
 to be at work on his *Coronation of the Blessed Virgin*.  
 the figures sketched, and the nimbi, which are more  
 ere lines, have been laid on by a gilder. The  
 is engaged in prayer before commencing the day's  
 ons. Altogether the picture must be considered as  
 eful both in selection of incident, composition and  
 nt. A semi-religious picture is Mr. THORNHILL'S  
 rine, a woman placing flowers before a triptych. Mr.  
 t's *Children of A. Wertheimer, Esq.*, is another  
 portraits; it would be more correct to say a quinary,  
 e are two dogs who are also posed. Like the larger  
 is in the Academy, children and dogs are shown  
 towards the spectator as if demanding admiration.  
 he boy, who is wearing an Eton suit, seems to say,  
 a pessimist, and is it any wonder when I think of the  
 ss of the poor creatures before me?" Yet while we  
 o the disposition, which is especially unsuitable for  
 t, we must express our commendation for the amazing  
 main by which so much effect is produced by hasty  
 apparently formless strokes. Mr. GLAZEBROOK'S  
 lmer corresponds with the popular notion of an  
 rator who is competent to perform onerous and  
 able duties. Mr. STUART DAVIS in his *Charybdis*  
 ited the syrens not as they are usually represented  
 ern artists, but in the ancient manner, as birds with  
 heads. They are hovering near the fatal pool,  
 as depicted must be regarded as irresistible. In  
 on *Sunset* Mr. MACWHIRTER appears to have  
 a scene in Westminster, although from its darkness  
 d to make out its position; but it is one of those  
 that are proofs of the picturesqueness of the  
 polis.  
 w statuettes have been introduced with effect in the  
 but the central hall, where works of sculpture used  
 ies to be seen, is now occupied with a collection of  
 e examples which are for sale. The majority of  
 e on a small scale. They all seem to belong to a  
 en no attempts were made to transform native art  
 to please European customers who were incom-  
 to appreciate the qualities which were prized in  
 The examples in ivory carving, lacquer, enamelling  
 sine as can be seen anywhere in Europe. They  
 our admiration for a race who found enjoyment  
 reproduction of created objects, and in that way  
 d a reverence for nature far beyond people in other  
 o claim the possession of a higher morality.

## THE ART OF SIENA.\*

THERE has been at all times a tendency towards unity  
 which seems to have its origin in a philosophical  
 or theoretical spirit. It is so compulsory it declines to  
 observe many important considerations. For centuries it  
 inspired visionaries with the hope of an united Italy. A  
 slight knowledge of the country would have shown that  
 although in Roman times the whole Peninsula was regarded  
 as if it were occupied by people who resembled one another,  
 yet a great many varieties were to be found within its  
 limits. There was as much difference between them as if  
 they were separated by long distances. The history of art  
 by itself is enough to reveal the strength of the peculiarities,  
 Rome as the capital and as the great encourager of art  
 during many centuries might be expected to uphold its  
 supremacy by the works of native artists. But the so-  
 called Roman school, until the period of the deca-  
 dence, consisted of men who should be classed as  
 foreigners, for they belonged to other parts of Italy. The  
 unity consisted in the power of bringing them together.  
 The schools of Florence, Milan, Bologna, Verona, Ferrara,  
 Umbria, Padua, Brescia, Venice had all special character-  
 istics which must be ascribed to the several idiosyncrasies  
 of the peoples. An attempt was made in a period of  
 decline to form an eclectic school for Italians, but it ended  
 in failure. To combine the drawing of MICHEL ANGELO  
 with the colouring of TITIAN and the grace of RAPHAEL  
 might be a desirable attainment; but in the proposal no  
 thought was given to that personal element which is so  
 essential in art. The characteristics of great artists must  
 be attributed in a large measure to racial power, and it is  
 absurd to suppose it was owing to no more than a defective  
 elementary education that MICHEL ANGELO was not as  
 enjoyable a colourist as TITIAN. It is possible, no doubt,  
 to compel young artists of many races to subject themselves  
 to an uniform course of training, if men are contented with  
 results like those of our Science and Art Department; but  
 wherever there are artistic elements provided by nature it  
 is best to allow her to have her own way and to foster  
 inborn peculiarities, although they may produce a variety  
 of schools.

The common phrase "The Italian School" is there-  
 fore one of those indefinite expressions which satisfy only  
 those persons who are contented with having hazy notions on  
 the subject. There was too much native power in Italy,  
 too many able men to permit of determinate qualities which  
 were to be common to them all. To understand Italian art  
 it is necessary to understand the works of many indepen-  
 dent schools, and to examine not only the productions of  
 kingdoms or principalities, but at times the works that were  
 executed in towns so small as to resemble villages. As an  
 example we may take Siena. Some years ago a book was  
 produced which obtained unusual attention in France: it  
 was a history of Christian art by M. RIO. But the part  
 which was most relevant to the subject was simply an account  
 of some Siennese painters. The conclusion to be drawn  
 was that in the author's mind Christian art was identified  
 with the works which came out of the studios of Siena.  
 There were strong reasons for M. RIO's belief. Siennese figures  
 possessed characteristics which were unlike those found in  
 the works of other schools, and bore a peculiar relation to  
 Christianity. Is it possible to explain their existence?

Siena was one of those towns which through accident  
 rather than purpose were long neglected. Although in  
 Etruria, it does not appear to have attained importance in  
 its early days. Subsequently it became a Roman colony,  
 but from its position on top of a hill it was reputed to be  
 difficult to approach. It was the seat of a bishopric in the  
 sixth century, and probably in a much earlier age. It was  
 allowed to be independent, and in the Government plebeians  
 as well as patricians took part. In the wars of Guelphs  
 and Ghibellines it was not inactive, and from the fourteenth  
 century life in Siena was as uncertain as in any of the other  
 Italian cities.

From its remoteness we can comprehend how easily a  
 style or manner when it had once taken root in Siena would  
 be fostered as if it were incomparable. Duccio in the  
 beginning of the fourteenth century executed the wonderful

\* *Siena: its Architecture and Art.* By Gilbert Hastings. (London: The De La More Press.

altar-piece in which gold was liberally used. There was a proverbial expression that as many good painters came from his workshop as warriors from the wooden horse which was brought into Troy. But it was not for painting alone Siena was renowned. A school of sculptors was formed at an early date, and one of the members is said to have spent no less than nine years on a bronze tabernacle for the cathedral. Pope PIUS II. was a native of the city, and he exercised his influence for its benefit. But there was a self-reliance among the painters which enabled them to dispense with courtly favours. The Siennese artists, unlike those elsewhere in Italy, were not simple academicians or members of a religious guild; they formed a corporation which sometimes supplied the first magistrate to the city. The custom in Italy was for painters to be under the control of the Church, but in Siena no control was exercised except that of the Government. Before Duccio's time there were painters, and it is believed that works exist that were produced in the twelfth century.

So renowned a place is not likely to be forgotten by those who investigate the history of art. Siena is fast coming into favour. One of the latest books on Siennese work is by Mr. GILBERT HASTINGS. It seems to us, however, that he has judged the inhabitants, and especially the artists, by the standard of our time. Everybody now seeks a reputation which will extend beyond the place to which he belongs. It may seem incredible that artists lived in Siena who were satisfied with local renown, and did not covet the applause of cities which to them were foreign. But their contentedness should not be looked upon as an indication of weakness of spirit, although to many it will have no other signification. Mr. HASTINGS says:—

It cannot be claimed that the story of Siena presents us with the most important or the most complete of these separate developments. She never rose to a leadership in Italy, and her art, in spite of its century-long charm, and its three or four names of first-rate eminence, could never have done for Europe what was achieved by the more virile and scientifically-minded Florence, or the wealthier and more sensuous Venice. Except at one moment when she sent her painters across what is now the fertile Val di Chiana—then a swampy marshland towards Perugia—and gave the school of Umbria at its start that tendency towards a quiet grace of action and of feature to which later men added a pietistic touch not always sufficiently removed from the lackadaisical, her work was self-contained and led to very little outside her own walls. While her neighbour Florence was raising a breed of men to change the world—painters like Giotto, whose link with his predecessors, considered in relation to the amount which he invented anew, is extremely slight, and whose career as he passed from place to place in Italy, superseding the elder and by no means always dying schools, and founding a new art dynasty in their place, was as effective as Napoleon's in altering the face of things—Siena proceeded by a slow development to create out of archaic beginnings a manner of painting in which a delicately pretty type, beautiful colour, and an exquisitely rich and varied ornamentation provide an ample satisfaction for the searcher after loveliness.

In Siena conservatism was potent. At an early time Byzantine artists or Byzantine works found their way to the city, and the principles they represented were afterwards steadfastly upheld. Some of the artists occasionally emigrated, but when in difficulties they realised there was no place like their own city. This is suggested by the history of PERUZZI, the architect. If he had remained in Siena his name might have been as unknown as that of his master, but he made a journey to Rome and there he was honoured. He succeeded RAPHAEL as architect of St. Peter's. But after the sack of Rome he was glad to return to Siena, where he was pensioned and given charge of the fortifications. He pined for more success and went back to Rome, and there it is believed he was poisoned. The artists of Siena did not claim to be more than ordinary citizens. It is known, for example, that there were at least four painters who were called UGOLINO, but it is impossible to discriminate between them owing to the want of biographical information. GIROLAMO DEL PACCHIA was also esteemed in Rome as a painter, but he preferred the humbler life in Siena. NICOLO DI BUONACCORSO's works are now extremely rare, and this is the more remarkable, as in Siena he held the offices of Gonfaloniere and Capitano del Popolo; but to the people his administrative powers were not enhanced by his art, nor the value of

his works increased by his appointments. The Siennese clung to their own opinions, and whatever may be the character of their art it was, at least, consistent; they aspired to become eclectics. The Siennese and Bolognese are at opposite poles in the history of Italian art.

It is not easy to trace the conservatism of the Siennese in architecture as far as is desirable. The Hospital of Santa Maria della Scala is said to date from 832, but whether any part of the early buildings exists is not known. The most important architecture is of the thirteenth and fourteenth centuries, and it could only have superseded an earlier style through unusual influences. The Palazzo del Pubblico was erected between 1295 and 1308, and the beautiful tower which attracts the admiration of LEONARDO DA VINCI was completed in 1344. The cathedral, which is no more than a portion of the building that was contemplated, dates from the fourteenth century. Owing to the plague Siena suffered, and the people were too poor to erect a cathedral that would be worthy of the city. The black and white marble in the walls and in the pavement becomes monotonous, but the Siennese would never give up half-measures. The two colours were also dignified in the eyes through their heraldic interest. The pavement is of the features of the cathedral which excites most interest. The Romans had pictorial mosaic floors which were used upon without hesitation, but in a Christian church a congregation was supposed to kneel, and the intention was no doubt, to enable people while in that position to read the sacred history. Men's thoughts will wander, and it is better to have them attracted by scriptural scenes than by worldly matters.

The importance of pictorial art in Siena is not to be estimated by the slight value attached to an occasional wall-decoration in one of our public buildings. Even the French and the Germans look on wall-paintings simply as ornaments. In Siena, as we have said, the painters took their share of municipal affairs, and it was allowable for them to conclude that their art could be made to subserve the purposes of government by suggesting the difference between order and anarchy. The Siennese were difficult to rule. MONTAIGNE declares from what he saw during his visit that Siena was governed with more foolishness than any other city in Italy, and that at all times it was dominated by some faction. The hall assigned to the cross-bowmen in the Palazzo Pubblico was adorned with paintings by AMBROSIO LORENZETTI, which were intended to mark the contrast of good government with bad. Mr. HASTINGS gives the following description of the subjects:—

One side of the room was covered with a representation of the results of good government, both in town and country. Various sorts of profitable occupations are being carried on within the walls of the city—trading, teaching, building, and by no means least, dancing in a ring; while in the country-side with hunting, hawking and secure travelling can be perceived. On the opposite wall exhibits what may be expected to happen when what probably did happen, under an evil administration, divided one. Murder, outrage and theft throng the streets of the unfortunate city, its own citizens destroy its defences, and the friends of every imaginable kind hover about it. It may be readily conceived that such subjects lent themselves to the delineation of action and of passion, and Ambrosio Lorenzetti did not show himself altogether unequal to it. A more difficult task, both in art and in philosophy, was set the painter when he had to represent on the cross-wall which connected the two a series of mentioned pictures, not the effects of good or bad government, but the causes of them. The complicated allegory is redeemed by the charm of feature and delicacy of pose which characterise the numerous virtues who are assisting and counselling the majestic figure, draped half in white and half in black, to the colours of the city's banner. He represents the embodiment of the Commune, and sits surrounded by Peace, Fortitude, Prudence, Magnanimity, Temperance and Justice, while Concorde removed holding one end of a rope which binds together the twenty-four governors.

In other public buildings of Siena apposite ideas are expressed by the painter's pencil. Similar works were found on the exterior of buildings. Art exercised a sway over the city to a greater extent than is now believed, owing to the indifference of the people to preserve records of their actions with painters, sculptors and architects. On account of this it is well to have as many books as possible of the history of art in Siena, and Mr. HASTINGS's can be recommended to travellers who are about to visit one of the most interesting of all the Italian cities.

## A PROBLEM IN RESTORATION.

HERE are various systems of restoration, which can, however, be grouped into two great classes which may be called the French and the English. The French system, which originated with the Historic Monuments Commission, allows opportunities for the exercise of imagination on the part of the restorers. It is assumed that in dealing with a building it is best to treat it as the original architect would have done if he lived at the time of the restoration. In that way it becomes permissible to employ many modern devices. Sometimes a plain building is changed into a gorgeous structure, and occasionally one that is simple is made to assume a still more primitive character.

That mode of interpretation of ancient work is, however, in keeping with the French disposition, and is appreciated abroad as a more rigorous and reverential method of conducting restorations. It corresponds with the French manner of translating foreign works. SHAKESPEARE, to take a case in point, is supposed at one time to be little better than a savage who tried to write plays without having the least knowledge of rhetoric. He resembled, therefore, one of the Mediaeval architects who might have been a genius but had not passed through such courses as were dictated by the Academy of the Arts. Subsequently, the English dramatist came into favour with the French, and in order to manifest their esteem for him his works were translated; but as in the case of buildings, they were believed to be improved in the process. Even a *bon enfant* like ALEXANDRE DUMAS, who made no pretence about being a superior person, produced a version of "Hamlet" which was so peculiarly French as to become ridiculous. But it must be said that the translation was as logical as many of the restorations which were controlled by the Historic Monuments Commission.

We cannot deny that during long years Gothic buildings were operated on in England in a manner which was worse than that followed by the French architects. The French innovations, although they may not be in keeping with the original works, are at least interesting, if they should be considered independently. But throughout England churches are to be seen which are not only full of anachronisms, but anachronisms which are vulgar and ugly. It was not to be expected, when local builders were employed to make changes without having sufficient supervision, that the spirit of the original artists would be appreciated and respected. It must also be allowed that the desire to have cheerful churches in which all parts would be as bright as possible has been fatal to much work. The efforts of the clergy to secure and retain crowded services could not in many places be impeded by considerations of archaeology. But while all this has to be admitted, it cannot be disputed that the endeavour of English architects has been to show regard for the original design, and if alterations are necessary to keep them as far as possible in unity with the old work. However careful a restorer may be, he will sometimes find himself at variance with other architects, who may draw different conclusions about the course which should be followed.

A case of the kind has just arisen in Scotland. It is proposed to execute some restorations in the beautiful church of St. Michael's, Linlithgow, in commemoration of a new reign. The plans for the purpose have been prepared by Messrs. JOHN GORDON & BENNET DOBSON, of Glasgow. It is not necessary for us to describe all the recommendations. Among the contemplated works are the rebuilding of the part of the tower which is 45 feet above the eave, the restoration of the crown on the tower, the reslating of the aisle roofs, &c. But, according to the abstract of the report which has appeared in the papers, there are to be certain "improvements." The most costly of these is the construction of a groined roof over the nave and of no less than eighteen flying buttresses. A French architect would no doubt rejoice at the adoption of the latter proposals, but we must say they are not in keeping with English practice. There is no denying that the stone roof and flying buttresses are innovations. This is admitted by Messrs. GORDON & DOBSON, for in the abstract of the report it is said:—

In the construction of the triforium and clerestory walls there is no internal indication that the nave has ever been

roofed with stone, neither is there any external indication of there having been at any time flying buttresses to resist the thrust of stone vaulting. It may be that the walls at this part (which are 3 feet 4 inches thick) are strong enough to resist the thrust of stone vaulting, without the aid of flying buttresses. The absence therefore of external indications of flying buttresses is by no means conclusive evidence against a stone roof having ever existed. At the same time, had there ever been such a roof, we feel confident that there would have been some kind of internal indication thereof. However this may be, the fact that both aisles are roofed with stone inclines to believe that the original intention of the architect would be to roof the nave in the same manner as the aisles, and that this intention was probably abandoned through lack of means or otherwise. Should the heritors resolve to complete the design as originally intended, we would strongly recommend, for both structural and æsthetic reasons, that flying buttresses should be introduced, however practicable it may be in this case to construct a vaulted roof without the aid of these features.

In courts of law whenever suits arise which are connected with the intentions of an individual who is no longer living, the utmost jealousy of an exercise of imagination is observed. Who can determine what takes place in the mind of a man when he is performing any act? The only way out of the difficulty is to assume that an action performed by him of which there is undoubted evidence reveals correctly his intentions. If a man leaves money for building a church it would be held absurd for a counsel to argue that the defunct was a believer in the efficacy of schools, art galleries and theatres, and the money should be appropriated to one of those purposes. Chaos would come again in human affairs if we declined to accept actualities and substituted speculations about "original intentions" which a thousand people might interpret in a thousand conflicting ways.

It would be doing a great injustice to the architect of St. Michael's to assume that his building was unlike his plan. If he desired to have a stone roof, which was not universally adopted in Scotland, we may be sure that means would be found to realise his intentions. Linlithgow, it is well to remember, was no ordinary town; it was a royal burgh, with a palace of architectural character, as may be judged from the ruins. The conditions were therefore likely to be favourable for the construction of a vaulted roof if one were thought necessary. Whether the architect ought to have introduced one in order to perfect his building we need not discuss. A French architect would think there was nothing incongruous in now adding one of the most developed varieties; but, as we have said, the French system of restoration has not been approved in England, and we hope that it will never be accepted among us.

If the stone roof is unnecessary the flying buttresses must vanish with it. We cannot consider the proposal as in keeping with the Scottish manner, and we regard with grave concern the possibility that such innovations should be tolerated. Scotland has been in a close relation to France, and this is shown by many features in northern architecture. But whatever might have been the case in the past, we trust it will be no longer possible to imitate Frenchmen in disregarding the character of a building and substituting their own devices, on the plea that they are realising the original intention of an architect who lived several hundred years ago.

## MOUNT VERNON HOSPITAL, NORTHWOOD.

ON Tuesday afternoon Princess Christian laid the foundation-stone of this building. Her Royal Highness, who was accompanied by her daughter, Princess Victoria of Schleswig-Holstein, and attended by Lady Agneta Montagu and Colonel G. G. Gordon, C.B., drove over from Lord Ebury's seat, Moor Park, arriving at the site at about 3.30.

The chairman of the reception committee, Mr. B. A. Lyon, made a short speech of welcome, and some two dozen purses were presented to the Princess, after which, assisted by the architect, Her Royal Highness laid the foundation-stone. The hymn, "Now thank we all our God," was sung by the choir of Northwood Church, accompanied by the band of the Grenadier Guards. The Bishop of Kensington closed this part of the proceedings with a benediction. The new building is designed to extend the work of open-air treatment of consumption so successfully carried on by the parent hospital at Hampstead. It provides accommodation for 100 patients—fifty males and

fifty females. The wards are arranged in linear series, all facing south, with a spacious cross-ventilated corridor on the northern side, off which the lavatory blocks are placed and connected to it by another cross-ventilated corridor.

The administrative block is placed between the two wings proper to each sex, and contains doctor's and matron's rooms, dispensary, library, recreation-rooms, and on the top floor accommodation for servants; two isolation wards are provided.

The nurses' home, kitchens, doctor's house and secretary's offices are all separately placed at some distance from the main patients' block, and connected to it by a wide corridor. The patients' dining-hall, which is common to both sexes, is also detached.

Pathological-rooms, mortuary, laundries and electric-lighting station will also be provided. Great consideration has been paid to the general planning and design of the buildings by the committee and architect, who, indeed, have spared no pains in endeavouring to erect a sanatorium that shall fully meet all the modern requirements of the open-air cure for consumption.

Five well-known architects were invited to compete for the design, the plans of Mr. Frederick Wheeler, F.R.I.B.A., of 6 Staple Inn, W.C., being selected, and it his design which is now being carried out by Messrs. Holland & Hannen.

The design for the patients' block is in the Royal Academy Exhibition.

An anonymous donor has given £120,000 towards the erection and endowment of this hospital.

### WESTMINSTER ABBEY.

THE First Commissioner of Works, having been asked by Mr. Talbot, M.P., what precautions have been taken against fire, in view of the large amount of woodwork which now surrounds Westminster Abbey, in addition to the large amount collected within the building, states that an excellent arrangement of hydrants exists in the Abbey. The hose is kept fixed and ready night and day. The police on duty and the Abbey firemen have careful instructions as to the use of appliances and fire-calls. The Abbey has been inspected by the officers of the Metropolitan Fire Brigade, and they have not at present given any sign of dissatisfaction. Mr. Akers-Douglas has asked Captain Wells to let him know should anything be required additionally to safeguard the Abbey. He is informed that the insurance company which insures the fabric for the Dean and Chapter has not required any premiums to be paid for extra risk. Mr. Akers-Douglas has warned the authorities of St. Margaret's to provide for the safety from fire of the stands which are being erected in proximity to the Abbey upon land not within his control.

### TESSERÆ.

#### The Duomo of Turin and its Chapel.

THE Duomo at Turin was built by the Cardinal Domenico di Rovere in 1491. It is said that he ordered his architect, who, according to some, was Bramante, to make a beautiful building and to spare no expense; but that the artist, from some pique against his employer, complied with the latter direction, but not with the former. One may believe his treachery against his employer, but hardly that against himself—at the same time everyone acknowledges that he has not made a beautiful building. Above the altar an arched opening exposes the chapel of the "Santo Sudario," in which is kept the shroud, or imitation of one, which recently was made the subject of some comments. Entrance is gained by a dark staircase of black marble to the chapel, which is considered the masterpiece of Guaini. Black marble is used throughout except the capitals of the columns and some other ornamental portions of bronze. In these capitals the crown of thorns is appropriately introduced amidst the leaves of the acanthus. The pavement is composed of a dark blue marble, also inlaid with bronze. The plan of the building is circular. In the centre is the altar of black marble, upon which is placed the shrine, brilliant with gold, silver and precious stones. The first and lowest divisions of the chapels are composed of arches. Above rises a most singular dome, if, indeed, it can be so-called, formed of arched ribs, on chords of the circle, from the summits of which other similar ribs spring in succession. To describe the building minutely is impracticable, because, although it professes to be in the Italianised Roman style, the members are so varied and combined that they cannot be really designated by any of the acknowledged terms of the vocabulary of architecture. The workmanship of the whole is excellent. The building seems cast at one jet.

### The Italian Eclectics.

The school of the Caracci has been often described merely imitative, but perhaps this has arisen rather from the well-known and professed objects of its institutors and followers than from a particular evidence of that object in their productions. If a certain resemblance of manner, whatever it derived from, characterise the masters, it may be admitted that no school presents so much variety as is to be met with in the works of their disciples. This, it must be confessed, cannot be said of the followers of Michel Angelo and Raphael. The example of an eclectic style may thus lead to a more original style, whereas the example of an original style, if it cannot be surpassed, can only end in a weaker copy. Yet assuming that the Caracci were as independent of the spirit of their age as we are free to choose their path as their biographers would lead us to suppose, had they endeavoured to follow up the feeling of Francia (not to return to Lippo Dalmasio or to Giotto) they might have succeeded in connecting the highest effort of the school with that earlier, national or local style which, as we have seen, was nipped in its growth before it was fully developed, partly perhaps because Francia devoted himself late in life to the art, and thus still adhered to the incomplete, and, as it were, preparatory mode of imitation when the perfect one had already been introduced. The merit of this pain as one of the characteristic Italian masters should not, however, be forgotten, and his style is not the less interesting for being connected with that original school of Umbria, distant from the Florentine, which was remarkable for purity of expression, and which had so much influence on the education of the genius of Raphael.

### Polychrome Sculpture.

A passage occurs in the thirty-fifth book of Pliny, which has received a different translation from the one most obvious and directly supporting this practice of colouring accessories of statuary. He wrote:—This is that Nicias (Athenian painter), concerning whom Praxiteles said, who asked which of his works in marble he most approved those which Nicias has applied his hand to; so much Praxiteles attributed to his tinging, "circumlitio." This last word may be rendered, adorning with paint, doing over, or, as its sense is more exactly supplied in the German, *umschmieren*. The work of Sir Charles Fellowes on his discoveries in Asia Minor has thrown light on the earliest history of Grecian painting. An inscription was found by him at the ancient Aphrodisias in Caria, to this effect:—"That Callias, grandson of Zeno, son of Eudamus, an honourable and good youth, whose conduct was virtuous and worthy of all praise, be honoured with the greatest and fairest honours, and that there be put up his statues and sculptures and images, painted in golden armour, in temples and public places, whereon there are also to be inscribed his honours fair, and befitting and becoming family and the conduct of his life, and that these words and inscriptions be likewise placed on his tomb, in which his brother Zeno also is buried." According to this inscription the temples and public places of Aphrodisias were decorated with statues in painted or gilt armour, for EIKON GRAPHE (the phrase employed) is a painted statue or image of personage to whose honour the tomb was erected. In the literature and art of Greece that the last century has possessed, is adduced to bear the same testimony. To my satisfaction I received, says the author, on my return to Athens, in renewing my acquaintance with the justly-celebrated Professor Müller, has made me more aware of the immense influence Europe has sustained by the death of one of her greatest scholars, in all the vigour of life. On seeing the colour drawings of this tomb (the author speaks of one he had covered in Myra, a city of Lycia, the walls of which were surrounded with reliefs entirely coloured), he expressed the following opinion as to the mode of colouring adopted by the Greeks in their works of art:—The ancients painted their reliefs, they only tinged their statues, tinging the drapery leaving the flesh part uncoloured; (2) the wounds and blood were stained and the earrings and ornaments gilded. The temples were left white, but parts of the frieze and architectural ornaments were coloured, but very minutely. Their temples of coarse materials were plastered and entirely coloured. The Parthenon frieze was coloured, all the backgrounds of the bas-reliefs were painted. This was his opinion at Athens. In June 26, 1846. In further corroboration of this were discovered in the excavations at the Count Lozzani's villa, near the Porta Pia, Rome, the three large sarcophagi which are now in the Gregorian Museum at the Lateran Palace, and whose reliefs, as well as the walls of the tomb containing them, were entirely coloured on their first exposure, the wreaths of flowers on them with all the hues of nature, the Orestes pursued by the Furies and other groups, all in well-preserved tints. Since the removal to the museum, from whatever cause, these have almost entirely disappeared.

### The Bushnell Family.

John Bushnell was an admired statuary in England during the seventeenth century. He was a scholar of Burman. He spent England, stayed two years in France, and from thence went to Italy. He lived some time at Rome and at Venice; in the latter city he made a magnificent monument for a Procuratore di San Marco, representing the siege of Candia, and a naval engagement between the Venetians and Turks. He came to England through Germany by the way of Hamburg. Some of his first works after his return were the statues of Charles I. and II. and Sir Thomas Gresham at the Royal Exchange. His best were the kings at Temple Bar. He carved several marble monuments, particularly one for Lord Ashburnham in Essex; one for Dr. Grew's wife in Christ Church, London; one for Lord Thomond in Northamptonshire, Cowley's and Sir James Fairborn's in Westminster Abbey, and cut a head of Sir Talman. He had agreed to complete the set of kings at the Royal Exchange, but hearing that another person had made interest to carve some of them, Bushnell would not proceed, though he had begun six or seven. Some of his provision asserting that, although he was skilful in drapery, he could not execute a naked figure, he engaged in an Alexander the Great, which served to prove that his rivals were in the right, at least in what he could not do. His next whim was to demonstrate the possibility of the Trojan Horse, which he had already treated as a fable that could not have been put in execution. He undertook such a wooden receptacle, and had the dimensions made in timber, intending to cover it with stucco. The head was capable of containing twelve men sitting round a table; the eyes served for windows. Before it was half completed a storm of wind overset and demolished it, and though two vintners, who had contracted with him to use the horse as a drinking booth, offered to be at the expense of erecting it again, he was too much disappointed to recommence. This project cost him 500*l*. Another, of vessels bringing coals to London, miscarried too, with deeper cost. These schemes, with the loss of an estate that he had bought in Kent, by a law-suit, quite overset his disordered brain. He died in 1701, and was buried at Paddington, leaving two sons and a daughter. The sons, of whom one had 100*l*. a year, the other 60*l*., were as great humourists as the father; they lived in a large house fronting Hyde Park, in the lane leading from Piccadilly to Tyburn, which had been built by the father, but was unfinished and had neither staircase nor floors. Here they felt like hermits, recluse from all mankind, sordid and imitatable, and saying the world had not been worthy of their her. Vertue in one of his MSS., dated 1725, begins thus:—"After long expectations I saw the inside of John Bushnell's house, his sons being abroad both." He describes it particularly, and what fragments he saw there, especially a model in plaster of Charles II. on horseback, designed to have been cast in brass, but almost in ruins; the Alexander and the finished kings. Against the wall was a large piece of his painting, a triumph, almost obliterated too. He was desirous of the particular notice of a bar of iron, thicker than a man's fist, broken by an invention of Bushnell.

### The Cathedral of Pisa.

The honour of taking the lead in the development of manesque architecture belonged to Pisa. She had become the most considerable maritime power of Italy. Her fleet of galleys was employed with much success against the Mahomedan pirates who infested the coasts of the Mediterranean, and she acquired great renown in 1063 by a brilliant and successful expedition, in which Sicily was freed from the Saracens, and a vast amount of treasure and six richly laden vessels were carried off from Palermo. The Pisans thought they could not better than devote this booty to the erection of a cathedral, which in size and magnificence would rival St. Mark's at Venice. The name of the architect, Buschetto, has been preserved on his tomb, and he must rank among the few men of original genius who have inaugurated a new epoch in architecture. Who does not number among his most cherished memories of Italy the grass-grown old Piazza of Pisa, with the cathedral, the leaning tower, the baptistery and the Campo Santo—a group rivalling in fascination the Piazza of St. Mark at Venice? And not the least lovely element in this lovely whole is the façade of the Duomo, with its four storeys of delicate arcades piled above each other, and prolonged in fantastic richness under the sloping roof. Kügler rightly esteems the Cathedral as the most noble as well as the most important building of its age, but Fergusson is of a different mind. While acknowledging the separate beauty of the details, he characterises the style of ornamentation as false, clumsy and less, adding that the subdivision into five orders is more open to criticism than the two orders of our own St. Paul's. The orders of St. Paul's are objectionable, not because they lack its height, but because the upper order is a sham, hiding the true structure and suggesting a false one; whereas there is no such fraud in the Pisa arcades. It is certainly not a

principle universally true that minute subdivision takes from magnitude. We judge of the size of a building from a combined impression of the size of the part most in view, and the number of parts. The arrangement of Pisa façade, similar in idea to that of the campanile above described, is about the most effective that could be devised for producing the impression of height. There is no break till the wall has reached an elevation too great for the eye to measure it, and beyond that point every additional division adds to the apparent height. The upper arcades are completely subordinated to the lower one, and as the basement arches are not recessed, their extreme richness does not take from the general character of solidity. Buschetto's style and model was adopted in a numerous family of churches at Pisa and Lucca, in which the singularly storeyed façade repeated in the Luccese churches with far more richness of ornament.

### Roman Tombs.

The ancients considered a tomb in a much more important light than we either can or ought to do. So feeble, indeed, were their hopes of living in another state of existence that they generally looked forward to this honour as the only blessing that awaited them after death. Hence we so frequently discover on monumental inscriptions the anxiety the individual had during his lifetime to provide a place of burial for himself and his dependents free from incumbrances and intrusion, and we cannot wonder that the rich under those circumstances should have bestowed so much wealth in erecting their private monuments, and the warrior so much care and toil in gaining this as a public honour from his country. The argument which Cicero uses in his "Tusculan Questions," to show that great men who exist no more on earth are still to be accounted happy, is that their proud monuments perpetuate their fame to posterity, and announce their glory to every passing traveller. In placing their tombs, moreover, by the sides of the public roads the ancient Romans accomplished two objects respectively adapted to flatter their pride and support their renown. The foreign ambassadors, in approaching the city, were struck with the splendour and public spirit of the commonwealth, and the Roman youth, in having those immortal honours always before their eyes, aspired to emulate the valour of the illustrious dead. "When thou hast gone out of the Capena gate," says Cicero, "and beholdest the sepulchres of Calatinus, of the Scipios, of the Servilii and the Metelli, canst thou deem the buried inmates wretched?"

### The Dawn of the Renaissance.

Brunelleschi and Alberti were the first Italian artists who, in the beginning of the fifteenth century, studied the ruins of ancient Rome; they made the earliest essays in the renaissance of Classic architecture. Now, if these artists had discovered in these ruins (as the first Christian builders did at Spalato) a new principle of construction, capable of indefinite expansion in the wider fields of the new civilisation, instead of an order of architecture, a more or less inflexible dogma of proportion, and if Francis I. had carried that principle back to France with the spoils of his first Italian conquest, instead of taking with him a crowd of Italian artists, the guardians of the ancient formula, we might have witnessed the phenomenon of another impersonal art like that of the Mediæval period, to the development of which, in the course of time, the genius of the great French Renaissance masters, Philibert de Lorme, Pierre Lescot and the Mansarts would hardly have been necessary. If, on the other hand, at the end of the Romanesque period in the twelfth century a certain form and proportion of vaulting and abutment had been invested with such peculiar sanctity that it would have been impious to vary from it henceforth in any essential particular, decoration would have at once assumed the first instead of the subordinate place in the architecture of the thirteenth and fourteenth centuries, and, instead of a series of nameless masons and master-builders, we should have had a catalogue of individualities as illustrious and specific as that which confers its peculiar personal interest on the history of the Renaissance. As to the evidences of the personal character of Renaissance art, although the Classic formula was set up and accepted as absolute authority in the fifteenth century, although it has been used with veneration for nearly five centuries up to the present time, and although every architect since Palladio designing in the style of the Renaissance has intended above all things to be correct in the use of this simple style and to build according to the Italian taste, the result has been, not monotony, not cold and colourless uniformity, but a variety of expression elsewhere unknown in architecture. In studying these variations as they are exhibited in the buildings of the Renaissance up to the present day we shall find they are not capricious or accidental; there was one class of variations in France, one in England, one in Germany, one in Spain, one in Holland, one in Italy. These distinctions of class are easily recognisable; they follow natural laws, they interpret national temperament or genius by a visible demonstration.

## NOTES AND COMMENTS.

WE have referred to the discontent of the Australian builders in regard to the extravagance and unwisdom of the Government of the Colony in finding employment for workmen with liberal wages for an insignificant amount of labour. The master builders recently met at Sydney and adopted the following resolution:—"That this federation of the Master Builders' Associations of Australia strongly protest against the action of the various State Governments in encouraging a system of employing direct labour in carrying out its public works at a much greater cost than it could be done by contract. We, therefore, request that the members of the various State Parliaments be asked to request their respective Governments to appoint a commission to inquire into the cost of all or any Government work done under the day labour system." The instances which were mentioned as showing the system that prevails were extraordinary. One builder said that every carpenter in the railway department in Victoria had a labourer to attend on him. He had seen a labourer holding the nails for the carpenter, and in other cases a man handing a paint brush to the painter. Seven or eight men had been found to be driving piles with a hand winch, and each of them received 7s. a day. Another builder related that his workmen left him, although he was paying 7s. a day, because the much easier occupation on Government works at 6s. 6d. a day was preferable. There is, however, only a slight hope of reform because the day-labour system is supposed to be kept up by politicians of all parties. But, meanwhile, the master builders desire a commission in order that the defects of the Government practice may at least be revealed to the people of Australia.

PHOTOGRAPHIC surveys are now being formed in several of the English counties. Surrey is the latest to adopt the process of recording existing scenes. It is proposed "to take and preserve permanent photographs of the scenery, geology and natural history, antiquities, buildings, streets, social life and public events of the Surrey of to-day, as well as the reproduction of old prints, maps and records of the Surrey of the past." A more interesting occupation is not easily to be discovered. A meeting has been held at the Public Library, Croydon, to elect executive officers, frame rules and transact other business. The chairman was Mr. W. W. WHITAKER, F.G.S., and Mr. GOWER, of Croydon, acted as honorary secretary. The provisional committee consists of gentlemen who can be useful as advisers, but when the council is formed we hope some architect's name will be found on the list. If old or modern buildings are to be photographed it is not wise to keep architects at a distance.

ONE of the works on which the late JULES DALOU was engaged within a few days of his untimely death was the monument of GAMBETTA which is to be erected in Bordeaux. As the work was not completed, it has been necessary to make arrangements for that purpose. M. FORMIGÉ, who is the architect of the monument, will, as the representative of the family, have the chief control of the execution. M. CAMILLE LEFEVRE will finish the group of the *Defence* with which the late sculptor was occupied. He will also have charge of the practitioners who will reproduce the remaining models in marble. M. LEFEVRE, who has assumed so onerous a responsibility, has already gained a reputation as a sculptor, and it was the last wish of JULES DALOU that he should take his place in carrying out the commission. DALOU's stoicism during the last week of his life was amazing. He made all the arrangements for the accomplishment of his numerous commissions with as much calmness and intelligence as if he were undertaking a holiday, during which he desired to be undisturbed by any casualties.

A CASE is now before the Edinburgh Court of Session which, when decided, is likely to affect the position of municipal engineers. It relates to a claim of 10,000*l.* by the widow of the late JOHN COOPER, burgh engineer, of Edinburgh, being the amount of commission owing for his services as joint engineer for tramways. In 1895 he was appointed with Mr. W. M. COLAM. A letter was addressed

by the town clerk to Mr. COLAM, which stated that the magistrates and Council had agreed to appoint him, with Mr. COOPER, as engineers, the commission to them jointly being 5 per cent. on the outlay. Mr. COOPER continued to serve as burgh engineer until 1901, when his health broke down. He wished his commission to accumulate, and drew no part of it. After Mr. COOPER's death the town clerk stated that 600,000*l.* had been expended, and that Mr. COLAM had drawn 15,000*l.*, his share of the commission. Assuming the representatives of Mr. COOPER were entitled to a sum, it would be necessary to deduct between 8,000*l.* and 9,000*l.* which had been paid to Mr. COOPER's assistants. It was stated, in reply, that 5,000*l.* was a sufficient sum for that purpose, and the balance, 10,000*l.*, is sued for. The Corporation deny liability, one of the grounds being that the terms of his appointment as burgh engineer Mr. COOPER was bound to devote his whole time to the office.

## ILLUSTRATIONS.

PUBLIC BATHS, ALLOA, N.B.: SIDE BLOCK.

18 &amp; 20 KENSINGTON HIGH STREET, W.

CATHEDRAL SERIES.—RIPON: GENERAL VIEW OF NAVE TO ORGAN SCREEN.

REREDOS, HOME OF THE GOOD SHEPHERD, UXBRIDGE ROAD,

THE smaller reredos was designed for a window recess which formed the east end or bay of the little chapel attached to the Home of the Good Shepherd, Uxbridge Road, W., then in the care of, and under the superintendence of, the Dowager Lady WILSON. Though the room was only about 24 feet by 18 feet, with a bay window at the east end it was fitted up very completely, having an oak altar and reredos, credence and alabaster piscina, teak prayer desk and panelling round the tiny sanctuary. The lower part of the walls of the chapel were lined with pine panelling stained green. A passage way across the west end formed by a panelled traceried and glazed screen in pine (painted white) was the communication from the home to the infirmary, and was so arranged that the sick in the infirmary could hear the daily offices when the doors were thrown open. The roof timbers were shown and stained a warm brown, as were also the chairs. The decorative scheme of colour was never fully carried out, owing to Lady WILSON's health compelling her to give up the good work. The reredos was executed in oak from designs by Mr. THOMAS GARRATT, architect. The figures of Our LORD on the Cross, with St. MARY and St. JOHN and the four evangelistic emblems in the cornice are carefully and beautifully executed, as is the foliage and tracery throughout.

REREDOS, ST. PETER'S CHURCH, BEXHILL.

THE larger reredos is in the old parish church of St. Peter's, Bexhill, and is the central feature of a very complete carved and decorative treatment of the chancel. The altar front, shown open in the illustration, is filled with a fine painting by Mr. W. G. RICH, illustrating the Women at the Sepulchre finding the stone rolled away and the angel guarding it. The reredos stands on a carved and traceried base, and immediately above it under a rich canopy supported by two shafts is a fine carving of the Lord's Supper in deep relief; on either side under arches are figures of the Patron Saint (his denial and repentance) above these two open-work traceried turrets are carried up. The central feature is Our LORD ascended in the act of blessing, contained within a vesica of conventional cloud and rays, the four spandrels bearing the emblems of the four Evangelists. On either side are figures of angels adoring under traceried arches, and between them and the central figure rising up from the shafts is a rich band of carving carried right round the framing. The dove, typical of the Holy Spirit, is at the apex, the space between the turrets and framing being filled with open-work tracery. On either side the reredos oak panelling, finished with rich crested, covers the walls. Mr. THOMAS GARRATT is the architect.

The decorative and colour scheme of the chancel is too elaborate to describe without illustrations, but will be found of interest by any who visit the church.

# THE ARCHITECTURAL ASSOCIATION.

The concluding meeting for the present session of the Association was held on Friday evening last, Mr. W. H. Smith, president, in the chair. Messrs. H. H. Fraser, W. Guthrie, G. T. Mileham and E. Mundell were elected members.

The following donations to the new premises fund were received:—Mr. G. T. Hine, 50/-; Mr. Max Clarke, 15/- 15s.; Gilbertson, 5/- 5s.; Mr. Alexander Wood, 5/- 5s.; Mr. Hunt, 3/- 3s.; Mr. A. W. Turnbull, 2/- 2s.; Mr. Horace 2/- 2s.; Mr. T. Bee, 1/- 1s.; Mr. E. Carless, 1/- 1s.; Mr. Hearn, 1/- 1s.; Mr. E. Hemingway, 1/- 1s.; Mr. G. W. 1/- 1s.; Mr. W. M. How, 1/-.

Total subscriptions to date, 4,206/- 11s. 6d.

Mr. OWEN FLEMING read the following paper [on

## Municipal Housing: Its Economic Basis.

It would perhaps be an exaggeration to say that housing is the problem of the day, and that finance is housing. But the connection between the two is so intimate and so far-reaching that unless the principles of finance are mastered, talk on housing, especially municipal housing, is almost futile. An excellent illustration of the prevalent confusion of thought occurred at the Paris Exhibition of 1900. At the Vincennes annexe were erected several examples of working-class dwellings, ostensibly representing the tangible outcome of the most recent housing in the different countries. Investigation, however, disclosed the fact that these specimen cottages were not designed on any common financial basis, but were either the arbitrary product of the constructor or the outcome of local and special considerations. Great Britain, for example, was represented by a group of the cottages erected at Port Sunlight by Messrs. W. Brothers. This cottage, however, was not the result of special financial conditions, but really represented the generosity of a distinguished firm of British manufacturers. On March 12, 1902, Mr. W. H. Lever informed this Association of the financial basis upon which Port Sunlight has been conducted. "The financial aspect of the village of Port Sunlight," he told, "said Mr. Lever. 'The capital it has taken to acquire 140 acres of land, build the cottages, schools, shops, recreation grounds, clubs, &c., and including making the roads, laying out the parks, &c., has been over 350,000/.' Upon this, Mr. Lever Bros., Ltd., receive no interest or return whatever, the rents being fixed at such an amount as only to pay for taxes, repairs and maintenance.'" However highly we may be disposed to value the work that Messrs. Lever Bros. have done, it is clear that municipal action cannot proceed on similar lines. A municipality has to account for its action to its constituents. There is no banking account upon which advances can be drawn at will. Every pound spent by a municipality on housing has to come from somewhere. The work of a municipality, in fact, to be administered on strictly commercial principles, capital has to be borrowed and redeemed; and unless due provision is made for the consequent interest and sinking fund provisions of the results achieved are of very little value. It is clear, therefore, that in considering any housing scheme the first point to be examined is the soundness of the financial basis, and in this investigation it is necessary to be somewhat exacting. Many apparently promising building schemes break down when submitted to this financial examination, and it has therefore seemed better to utilise the present opportunity for a description of the actual financial circumstances under which municipal housing work has to be carried out, rather than for a comparative analysis of the resulting architectural achievements. After the economic basis has been grasped, the architectural questions remaining will be not so insuperable a difficulty to experienced architects. The plan and general structure of housing buildings are the tangible and visible outcome of the intangible but determining circumstances.

The nature of the powers conferred on British municipalities by the Housing Act of 1890 is very extensive. Under this Act a municipality is empowered to acquire and demolish whole districts of any property, and to sell or otherwise utilise at their discretion the value the sites thus cleared for the erection of new dwellings. They may also go into the open market, and purchase vacant land for the construction of new dwellings.

In this work, it will be seen, is of a destructive as well as of a constructive character, and in considering the question of municipal housing, it is necessary to draw a very clear line between these two classes of work, which are totally distinct from one another. The destructive work is a compulsory duty laid out by the municipality for the benefit of the whole community and at the sole cost of the whole community. The Local Government Board has enacted that the compensation to the owner of the insanitary property purchased for demolition is to be assessed on the most severe terms, yet the difference between the purchase money of the old property and the value of the sites cleared by its demolition is always

considerable, and this difference is increased by the fact that the cleared land is earmarked for, and can only be sold at its market value for working-class dwellings.

It is not proposed in this paper to deal with many economic problems involved in the destructive side of the question. The following remarks apply solely to the constructive housing work which begins with the purchase of the cleared or vacant sites for dwellings.

The constructive work is a voluntary undertaking carried out on borrowed capital, and in respect of which the whole community reaps no immediate financial benefit, although the ultimate financial benefit is considerable. The destructive work during the period of redemption is exceedingly costly to the ratepayers. The constructive work during the same period should not cost the ratepayers anything. The destructive work finally vanishes from sight after the loan has been repaid. The constructive work leaves behind it property of great value.

The difficulties of constructive housing are due chiefly to an inadequate recognition of the financial conditions under which it has to be carried on. Municipalities are in this respect subject to the same laws as individuals. Their action is, and must be, largely influenced by financial considerations, and even a temporary disregard for these considerations inevitably sets up reaction, and in the long run impedes progress.

The first point to remember when studying housing finance is that it is an organic structure, and, like other organic structures, is subject to the laws of growth. Given this fundamental fact, the line of action almost becomes self-evident. It consists in the simple duty of guarding the growing structure from influences likely to check or impede its full development. These checking influences may arise from either of the three classes of persons which co-operate in the work of municipal housing, viz. (a) the stockholders; (b) the ratepayers, represented by the municipalities; (c) the rent-payers. Progress can only be made if each of these three classes is satisfied that its interests are being adequately watched. If doubt arises, the class concerned will either ask a higher price for its co-operation, or it will cease to co-operate. It is necessary, therefore, to consider in detail the functions performed by each of these three classes of persons. In a general way, it may be said that the willing co-operation of any one of these three groups can be secured by guaranteeing to it the market value of the services rendered by it. The stockholder, for example, cannot very well grumble if he receives the market rate of interest for the capital advanced by him. The ratepayer will be willing enough to perform his share of the work if he can assure himself that, at no immediate loss to himself, he is building up a property that is visibly increasing in annual value, and even a rentpayer's prolific power of complaint is lessened by the knowledge that there are numerous applicants waiting to take his place.

### (a) The Stockholders.

The functions of the stockholders are briefly to provide the sinews of war. The method of raising money, however, varies in different cities. London adopts the simplest and perhaps the most secure method by advertising its loan issues in the open market at a fixed price, and allotting the amount of the loan proportionately among the applicants. The rate of interest payable on the loans varies from time to time, according to the condition of the money market, but to avoid the disturbance caused by these periodic fluctuations, the rate of interest paid for the housing work of the London County Council has been fixed at 3 per cent.—a figure perhaps fractionally in advance of the mean rate of interest averaged over a period of years.

These loans are raised for definite periods, varying from thirty years in the provinces to sixty years in London and Glasgow, this latter term being the limit allowed by Parliament for housing loans. Some years ago the loan period diminished during the intervals between the periods of issue; but this inconvenience has now been removed, and as far as London is concerned, money can be taken up at any time for the full term of sixty years.

In Glasgow the Corporation maintains what is known as a "Floating Loans Fund." Shipowners and merchants deposit in the fund capital that is temporarily not needed. It is on call at a month, and the interest is fixed each year in May and November, at rates slightly above the current bank discount rate. The following table gives the rates of interest paid by the Glasgow Corporation during recent years:—

Year.	Amount of Loan.	Rate of Interest. Per cent.
1898-99 . . . . .	£1,273,357	£2 13 2
1899-00 . . . . .	1,276,785	2 18 6½
1900-01 . . . . .	1,287,025	2 19 10½

The smaller cities apply to the Local Government Board for a separate loan for each housing undertaking, the Local Government Board being the Government Department that is

entrusted with the administration of the Local Loans Fund. This is a Three per Cent. stock guaranteed by the Imperial Government.

It will be seen by this comparison that Glasgow raises its money at the cheapest rates, but the system of floating loans which enables this cheap money to be obtained is hardly capable of indefinite extension, and as the rate of interest fluctuates from year to year any period of financial stress affects prejudicially the whole housing work in a way that is rather disturbing. This element of luck is not possible with a financial system based upon an equal annual payment for interest fixed to run at this same rate during the continuance of the loan.

One of the most interesting aspects of housing finance is the question of the sinking fund for the compulsory repayment of loans. This is a question that is watched with some jealousy by the British Treasury. Acting under its advice, Parliament has formulated certain Standing Orders which require that all money advanced to local authorities in Great Britain shall be repaid within certain fixed periods. I use the term "Great Britain" advisedly, because the policy of loan repayment does not seem to commend itself to the Colonial mind; and I believe I am correct in stating that the whole of the great public works of Australia have been carried out on the principle of permanent loans without provision for repayment. The argument advanced is that the primary consideration is the development of the country, and the security against depreciation is to be found in the improved value that the Colony as a whole secures by the free use of the capital. The policy of the Australian Government in this question may not be financially sound. The periodic financial crises that occur in Australia lend weight to the view that it is not financially sound, but the position of the British Government seems to err in the other direction, with the result that enterprise is seriously and perhaps needlessly checked. The British error lies in the fallacy that the security will have entirely lost its value at the expiration of the sinking fund period. In other words, that the substantial housing estates of the great British corporations will resemble the baseless fabric of a vision, and that at the end of the sinking fund term they will have faded, leaving not a wrack behind. This position is so obviously untenable that the attention of statesmen is gradually focussing upon it as one of the first questions to be tested by the light of scientific inquiry. There is no desire as far as I am aware to imitate the boldness of the Australians and to dispense with the sinking fund altogether, but there is a strong and growing view that the terms of repayment should be made more elastic. At present, as has been stated, the sinking fund term varies from thirty to forty years in the provinces to sixty years in the Metropolis. There seems to be no reason why the provinces should not be brought up to the same scale as London. There the indestructible land is treated in the same way as the destructible buildings erected upon the land. The reason is not clear why it should be necessary to redeem the cost of the land. It will not deteriorate as time goes on. In all human probability it will increase in value, and the gradual redemption of the buildings upon it will annually increase the value of the whole security. It has also been urged that the maximum term for loans (including the land and buildings) should be extended from sixty years to 100 years. The importance of this extension to us as architects may be gauged from the fact that it would automatically transform each 100*l.* of capital available for constructive purposes into 116*l.* Oddly enough, the greatest housing loan of the nineteenth century, *i.e.* the Glasgow Improvement Trust Scheme of 1866, was granted by Parliament without any specific provision for repayment, and on May 31, 1901, Glasgow had only accumulated 10,257*l.* as a purely voluntary sinking and reserve fund in respect of an outstanding capital debt of 1,287,025*l.* This striking parliamentary lapse was corrected in the 1897 scheme, which was approved subject to a sixty years' sinking fund.

The method of sinking fund repayment differs in different cities. In London the system adopted is what is known as the cumulative annuity system. In addition to the ordinary simple interest a sum of money is deducted each year from the gross revenue received and invested at compound interest. These annual equal instalments, plus the compound interest on each of them, produce at the end of the sinking fund period a sum equal in value to the amount of the original loan, which is then repaid. This system is in itself economical, and has the added advantage that the sum to be deducted each year from the revenue does not vary from year to year. Financial experts will, I am sure, pardon the introduction of a somewhat homely illustration of the working of this principle. It is as if a snowball were formed out of the receipts and set a-rolling at the end of the first year after the buildings were opened. This snowball would continue rolling during fifty-nine years. At the end of the second year a second snowball of the same size as the first would be formed and set off on a similar journey. And the completion of the third year would witness the formation and departure of a third ball. And so on each year during the

whole fifty-nine years. When the sixty years were ended fifty-nine snowballs, which by that time would have assumed fifty-nine different sizes, would be rolled into one ball, and great ball would represent the total amount of the loan. Some other cities repayment is secured by the provision of annual instalments of principal, with the result that the cost for interest and sinking fund is greater during the earlier of a loan than at the later period. The disadvantage of the latter system, known as the instalment system, is that it is difficult to arrive at an annual estimate of receipts and goings, and the difficulties of producing a proper balance-sheet needlessly enhanced.

#### (b) *The Ratepayers.*

The functions of the second class of persons concerned, *viz.* the ratepayers, are somewhat analogous to those exercised in ordinary business by executors and guarantors: as executors they have to manage the estates as a trust and not for personal profit; as guarantors they have to make good the deficit of any. Skilfully managed on ordinary business principles a housing estate should pay its way, but if any deficit appears it has to be made good out of the current rate. It is therefore highly important in the interests of the ratepayers that housing accounts of a municipal corporation should be entirely distinct and published separately from the general accounts. This separate housing balance sheet should show every item of expenditure that is directly due to the housing work. If this separate balance-sheet is not published the ratepayers cannot see the financial effect of their operations. Liabilities may be incurred that otherwise would be avoided. Quite recently one of the most important municipalities in Great Britain determined to disentangle the housing account from the general accounts, with the result that the housing work was found to be drawing a subsidy from the rates to the extent of nearly 5,000*l.* a year on a capital outlay of 189,000*l.* Another municipality of equal standing happens to be so profoundly concerned by the presence within the city of a number of back-to-back houses inhabited by persons of a low earning power. The municipality is building new dwellings for this very helpless class, and is restricting the occupation of the new dwellings to them, and to them only. How valuable, and perhaps in the present case, however necessary, may be to restrict occupation to a particular class of persons it is clear that the standard of rent is thus artificially lowered below the ordinary market standard. There is, of course, an administrative reason why a city, if it be so minded, should underlet its tenements. It is purely a question of local policy. But the ratepayer may fairly require that the amount of the subsidy should be clearly set forth in the housing balance sheet. Again, arguments have been advanced advocating that the sinking-fund charges should be debited to the ratepayer rather than to the rentpayer. This is again a question of policy, but if such a policy were adopted the amount of the sinking-fund charges should be calculated and carried to their proper place in the housing accounts, so that the ratepayer should be able to tell at a glance what the municipal housing work was costing him. There is, of course, no need for it to cost him anything.

The policy of London is based upon the principle that it should not cost him anything. It is true that in London the ratepayers have advanced to the housing account a sum of 6,943*l.* 17*s.* 1*d.*, but this was a temporary advance, and the housing account is now almost in a position to repay the loan. There was a cash balance in hand on March 31, 1901, of 4,033*l.* 4*s.* 7*d.*, so that the real amount of the outstanding overdraft at this date was 2,910*l.* 12*s.* 10*d.* With this exception, which will probably disappear this year, the constructive housing work of London has not cost the London ratepayer anything from first to last. Moreover, the reserve fund for repairs and renewals has now grown to 8,934*l.* 18*s.* 2*d.*, and the sinking fund accumulations to 19,811*l.* 12*s.* 2*d.* Summarised, the financial change in London housing accounts from the date of their inception on March 31, 1901, is as follows:—

#### *Housing Account L.C.C.*

##### DECREASE IN VALUE.

Rate subsidy . . . . . £6,943 17 1  
And, of course, any depreciation in value of estates.

##### INCREASE IN VALUE.

Sinking fund account . . . . . £19,811 12 2  
Reserve fund for repairs . . . . . 8,934 18 2  
Cash in hand . . . . . 4,033 4 7

And any appreciation in value of estates.  
(Capital expenditure to March 31, 1901 = 772,125*l.* 3*s.* 5*d.*)

The Glasgow property is of somewhat exceptional character. It formed part of a great improvement scheme carried out at the cost of the ratepayers, and the constructive housing work as it were, gradually emerged from the unremunerative improvement scheme. In other words, the rate contribution to the improvement diminished as the housing work grew stronger. The rate stood at 6*d.* in the 1*l.* in 1866, and

ally, until in 1895 it was  $\frac{1}{2}$ d. in the  $\text{£}1$ ., and in 1896 ceased ther. Thenceforward the estate has been self-supporting. Only weakness of the Glasgow position has been the absence of a properly constituted sinking fund, and if this were based on a sixty years' basis, it is to be feared that the Glasgow estates might not pay their way. Other cities carry on their constructive housing work at a heavy annual cost to ratepayers, having regard to the restricted character of the tenements. It is fair to say, however, that this is chiefly due to exceedingly short loan terms under which most of their work had been carried out. If these cities could consolidate their housing loans into one stock, redeemable at the metropolitan term of sixty years for all purposes, the rate subsidy would be greatly reduced.

### (c) The Ratepayers.

This class of persons occupies a position contrary to that of stockholders. It has no permanent interest in the estates, but simply occupies the tenements as it would occupy any other premises, paying the market value of the accommodation afforded. It is true that in very exceptional circumstances a municipality—i.e. the ratepayers as a whole—may think fit to grant some tenements at less than their market value, but it is clear that such an artificial arrangement has no permanent basis. The school of thought, for example, that argues in favour of cases of compulsory expropriation of the tenant should pay the market value of the tenement from which he has been dispossessed, irrespective of the market value of the new tenement, does not contemplate, so far as I am aware, that such an arrangement should remain in perpetuity, and, speaking generally, I think it may fairly be assumed that rent, like all other things, will in time find its own level.

In this brief summary of the respective functions of these various classes of persons will enable the general economic position to be grasped. Market rates of interest, on the one hand, and market rents on the other, and a sufficient working balance between the two to enable temporary fluctuations to be met. This may seem a simple statement of the complex and complicated housing question, but most complex questions are reduced to simplicity by the elimination of the non-essential. It may, however, be urged that I have described a condition of stability and not one of growth. This is not, however, the case. The stability that I have described is a necessary precedent to growth. But the growth is very real. As has been stated, the sinking fund is framed on the assumption that the land and buildings will have become valueless at the expiration of the sinking fund period. This assumption is clearly inaccurate, as the land and buildings will retain a very considerable value at that date. But the sinking fund is accumulating more rapidly than the actual value of the property is diminishing. Therefore at any given time the sum of the sinking fund accumulations, plus the then value of the property, is mathematically bound to exceed the total of all sums taken at any previous period.

To illustrate the growth from actual figures a table is given showing the annual amounts of the sinking fund accumulations in the London estates. The totals given against each date represent the sum of—

Total of previous years' accumulations;  
Interest upon total of previous years' accumulations;  
Normal annual instalments from buildings already in

First annual instalments from new buildings completed in previous years.

#### Growth of L.C.C. Sinking Fund on Housing Estates.

Year.	Sinking Fund.
1895-96 . . . . .	£1,103 11 5
1896-97 . . . . .	3,228 13 9
1897-98 . . . . .	6,757 8 0
1898-99 . . . . .	10,582 3 8
1899-1900 . . . . .	14,536 10 5
1900-01 . . . . .	19,811 12 2

It should be a pleasing thought to London ratepayers that not only is this fund mathematically certain to increase each year, but the difference between each year and the preceding year is mathematically certain to be greater than the difference between any previous two years. This process will continue until the loan has been paid off, when the consequent set-back in figures will be compensated for by a quickened rate of increase, as the annual contribution will then be the whole of the net revenue from the property. When at last this is accomplished and the buildings become worn out and incapable of further production, all that will be necessary will be an advance in the sinking fund for rebuilding the buildings which, when completed, will contribute the whole of their net revenue as heretofore. The land of course, having once been freed, remains valueless for ever. The method of automatic growth is indeed so simple and so effective as to stimulate a mild feeling of regret that the constructive work of municipalities was not begun in the days of the Victorians rather than in those of Victoria.

Such are the financial conditions which govern the housing

work of British municipalities, and it is now proposed briefly to indicate the process by which the actual work of housing is carried on under these financial conditions.

The chief administrative difficulties of housing are to be found in the conditions of instability that have to be watched and accommodated as far as possible. There is the labour market, with its demands constantly increasing as the standard of life advances; the "material" market, sometimes violently oscillating from natural and artificial causes; the land market, troubled with the subtle advance of industrialism; and the sensitive rent market. And behind all these varying elements lies the constant pressure of the vast numbers of the overcrowded town populations, who are beginning to realise what they are losing by living under conditions stifling alike to their development in mind and body.

When a housing scheme has to be prepared the simplest method of procedure is for the architect to prepare a preliminary plan showing approximately the character of the buildings that could be placed upon the site. An estimate should then be prepared of the cost of erecting the building shown on the plan. This should include all the probable capital expenditure, i.e. cost of land, building, architects' fees, quantities, wages of clerk of works, lithography and all items properly chargeable against capital. It is generally wise to make a preliminary estimate on a cube basis founded on previous experience. If the financial margin is then felt to be too narrow rough quantities form a useful check. The sketch plans are then forwarded to the housing manager for the probable rents and annual outgoings to be estimated by him. These estimated figures should not be the rents and outgoings in force at the time of the estimate, but a forecast of those that will probably be in force midway through the sinking fund term. The figures are of great importance to the architect, and should if practicable be studied in detail; for it should be constantly borne in mind that the success or failure of any given building scheme lies not as in any ordinary architectural work in the absolute estimate, but in the relation that the estimate bears to the estimated production of the scheme. In order to facilitate comparison with the estimate of cost, the net annual income reported by the housing manager is converted by him into capital form, and this figure is technically known as the amount available.

The next step is for the preliminary estimate of cost to be compared with the preliminary amount available. If the amount available exceeds the estimate of cost the scheme possesses the elements of success. In any case, it is desirable for the respective estimating officers to confer as to the result disclosed by the comparison. It may be found, for example, that a deficit could be converted into a surplus or a surplus enlarged by some minor modification of the scheme. When both officers concur that the scheme is the best that can be devised, it is presented while in its preliminary form to the housing committee, and if then it is fortunate enough to meet with approval it is finally presented to the municipality in the form of a typical year's balance-sheet, which, if approved, forms the standard with which all subsequent balance-sheets are compared.

#### Example of a Housing Balance-sheet.

Accounts prepared to show the estimated effect on the rate of certain working-class dwellings:—

##### (a) MAINTENANCE ACCOUNT.

Receipts.	
To gross rental . . . . .	£468 0 0
„ Less—Empties . . . . .	14 0 9
	£453 19 3
Expenditure.	
By Rates and taxes . . . . .	84 19 6
„ Water rate and insurance . . . . .	18 6 0
„ Repairs . . . . .	51 9 7
„ Supervision and collection of rents, &c. . . . .	31 4 4
„ Contingencies . . . . .	11 14 0
	197 13 5
„ Balance available for payment of interest and sinking fund . . . . .	256 5 10
	£453 19 3

##### (b) INTEREST AND SINKING FUND ACCOUNT.

Receipts.	
To balance brought down from maintenance account . . . . .	£256 5 10
Expenditure.	
By interest on cost, viz.:—	
„ Land (value for housing purposes) . . . . .	£1,000
„ Buildings (including all incidentals) . . . . .	5,261
	£6,261
Interest at 3 per cent. on £6,261 . . . . .	187 16 7
„ Sinking fund to replace capital raised, £6,261, in fifty-nine years by cumulative annuity at $2\frac{1}{2}$ per cent. . . . .	47 10 10
„ Estimated annual surplus . . . . .	20 18 5
	£256 5 10

If the procedure here outlined is carried out with care and judgment, there is no reason why the housing work of a municipality should not proceed smoothly and without giving ground for reasonable public criticism. Progress will become more rapid as the work becomes more familiar to those concerned, and to this end intercommunication between the various municipalities engaged in the common work will probably be of great service. Movement, however, can only take place along the path marked out by the limiting boundaries of "Amount Available" and "Estimate of Cost." If these limits are overstepped the economic laws violated will seek to reassert themselves. Schemes have been advanced, for example, for the Imperial Government to make advances of capital at less than its current market value, but this is only a form of subsidy on the part of the general taxpayer to help meet the rent of certain individual members of the community. The idea of letting tenements at less than their market value is open to the same objection, as is a somewhat similar proposal to debit the sinking fund charges against the ratepayer instead of the tenants. If progress is to be quickened it should be accomplished by endeavouring to widen the space between the boundary limits rather than by overstepping them. This can be done either by—

(a) Reducing the cost of production by improved organisation, taking full advantage of modern machine production;

(b) Increasing the amount available by perfecting the system of management;

(c) Extending the sinking fund term.

Bearing these three points in mind, there seems to be little doubt that patient continuance in the present work will do much towards the solution of a question that is, in the opinion of those competent to form a judgment, at the root of most of our social anxieties.

## STREET ARCHITECTURE.\*

(Concluded from last week.)

### The Mezzanine.

WE have referred to the usual treatment of the shop or ground-floor storey by supporting pilasters and a carrying cornice with a reversion to ordinary proportions in the upper part, but the treatment of the storey over the shop front as a mezzanine or *entresol*, and as part of the shop front, must be dealt with. A few years ago it was more commonly used as an architectural device for getting over the difficulty of affording apparent support to the upper part than it has been of late years; the later developments of shop design have a tendency to make two storeys of shop fronts extend over an area of about half the elevation of the building. The mezzanine proper was enclosed by an arch springing from the side pilasters at the level of the head of the shop front spanning the whole frontage; if of ordinary narrowness, it would rise to the underside of the floor over the mezzanine; thus an arch was gained of considerable size, and at first sight of some capacity, not only for carrying the upper storeys, but of blending the smaller scale of the upper part gradually and harmoniously with the ground floor.

For single houses and shop-fronts this method has not proved very successful. It can be easily imagined, and indeed seen in many examples readily called to mind, that a large arch springing from narrow pilasters on the extreme limits of a frontage gives the impression that its thrust must be acting upon the neighbouring buildings—in the most likely cases also shops—and crushing them. The initiated would, of course, understand that this does not actually happen, as the arch is more apparent than real, the weight of the upper building upon it being probably carried on a concealed horizontal girder behind the crown of the arch. The success of the arched mezzanine treatment, therefore, depends largely upon the neighbouring abutments, and unless these are controlled by the same designer or pre-exist in a satisfactory way the experiment is very risky. Instances can be cited in very modern London of lofty and powerfully-drawn arches of brick and stonework carrying with apparently scientific and architectural balance a series of upper storeys by conveying their weight with every optical demonstration of mechanical law against the plate-glass expanse of a neighbouring elevation of the picture-frame order.

The *entresol* arch is also dependent for complete effect upon a sufficient reveal or exposed thickness on its under sides to convey an impression of the substance requisite to arch construction of ordinary walling materials. This is difficult where the shop front is continued upwards into the mezzanine, but can be obtained by recessing the window of the mezzanine upon the shop fascia.

The arched mezzanine treatment is most satisfactory if several fronts can be treated and a continuous effect, as an arcade, obtained, the arches over each shop corresponding providing the effect of mutual resistance to thrust which is required. In such cases there is no reason why the arch construction should not suffice for carrying the wall above provided that the easement of support required from the neighbouring houses is secured by the mutual covenants which originate in a joint ownership of such rights. The north of New Oxford Street, towards its western end, affords a successful and satisfactory example of this treatment, the proportions of the whole block and the reduced requirements of the upper storeys being harmonised with large openings of the ground and mezzanine storeys by architectural treatment of the arcade. Though this example may be open to other criticisms as to internal arrangements presents a standard to which unfortunately there has been no approach in any more recent example of an extended facade of shop fronts. The architect should be urged to continue to study the use of the storey over the ground floor as a mezzanine on account of its value in extending the carrying proportion of the shop front, and of combining them with the complementary storeys of the building into a homogeneous expressive design.

In general, architectural proportion is so much a matter of the relation of the solids to voids, that the designer of a shop-fronted house, limited as he is by earlier considerations, has very few principles left to guide him. The relationship of voids to solids cannot apply to this class of design, because solids have to be eliminated as a condition precedent to suitability for shop display. The architecture becomes a collection of window frames, and the solids of which these frames are apparently constructed are unreal concessions to architectural fancy, as in most cases the stone piers and window heads but casings to metal girders and stanchions, large and small alike. Deprived of grouping, confined in perspective, tied to topsy-turvydom of design, the architect of a shop front has difficulties to contend with which one devoutly hopes that he will never be alive to. But it is to be feared that, by the instructions of a commercial employer, his new front must be exactly like his superior rival's, or like the Louvre in Paris, or a Scotch castle, and he has steeled his artistic soul, reflecting that it is hopeless and profitless to struggle with a client who has no taste, that after all he is not paid by him for any other purpose than to provide him with just what he knows he wants.

### Names and Signs.

I have not mentioned other artistic terrors, as figure name tablets, signs and electric startlers, in many cases necessary to commercial existence, though rendered so only by the force of a bad habit, which could be readily and painlessly cured by statutory enactment. It may be suggested to the commercial world that the streets of shops in London are too where this obnoxious habit of self-assertive emptiness is more apparent than elsewhere, reputation and success being assumed by the public to belong to that house of business that dispenses with—to put it mildly—inartistic advertisement. However, part of that frank modernism which we have predicated for the commercial architect, the provision of significant spaces for inscriptions, and of such signs as architecture can by deliberate forethought prearrange and make properly conspicuous, artistic at once, is a certain part of the problem, and a bad means unpleasant one. Inscriptions and signs add a little value to buildings which grows in value with every year of history, and we could foresee a pleasant development of particular symbols and types in commercial architecture expressive of purpose in the building, of use alike to the tradesman and of interest to the public and artist.

### Horizontal and Vertical Principles of Design.

The architectural qualities which can be exhibited in street architecture are thus comparatively limited. In the great number of cases the front or façade only can be seen and is capable of considered design, though in corner buildings there is a return frontage available which admits of some grouping. The fronts of the many buildings forming a street are comparatively narrow and lofty, and, unless the street is a wide one, the general effect of the design can only be appreciated from the limited standpoint of the pavement, either in sketching approaching perspective or in a directly opposite view from a point near to and under the building. These limitations seriously affect the possibilities of successful results, it being borne in mind that the success of the architecture is that of executed building *in situ*, and not of the harmony of proportions in true elevation or upon its picturesqueness in ideal perspective view. The test of satisfactory result rather than of pleasing elevation must be applied rigorously to the work by the architect. This is not an easy thing to do, as elevation and horizontal effect is accentuated, while vertical lines and proportions are all foreshortened from either of the possible perspectives of an ordinary street. London and

\* A paper by Prof. Beresford Pite, F.R.I.B.A., read at the meeting of the Applied Art Section of the Society of Arts on April 8.

ure has but few examples of suitable methods of dealing with this difficulty. The horizontal cornice upon the skyline of similar lines subdividing the front above and below each story of windows are the more usual methods. These have come simple to the designer solely from custom and from the facility with which they are drawn with a T-square, but a free consideration of the problem of designing narrow frontages to buildings in a narrow street would certainly suggest that horizontal lines, with no continuity beyond the limits of a small area, are not the only means with which to attempt suitable design. The varying contours of streets, sometimes broken, crooked and crooked, sometimes in long straight lines, would suggest some treatment which would not necessarily—as conspicuous horizontal lines must—throw each separate frontage into violent contact with the proportions of its neighbour.

There grew up in Gothic times, in the narrow, devious lanes of Mediaeval towns, a method quite as universal as the use of horizontal cornices and lines, in the use of vertical ones, in which the grouping and arrangement is upwards. Each window in a storey was grouped over the one below it, the origin lines being made continuous, and often carried up into the gable in which the centre one reached to the top, creating a unity in the roof as it went up. This principle seems more natural and proper, and one can easily imagine its growth among the craftsmen as a necessary tradition of street building, vindicating itself by its suitability and truth of expression to their artistic instinct. It may be remarked that, in other instances of building, all of the same period, such as in the external design of churches, detached houses and castles, there is no such universal tendency of vertical expression, the use of ornamental and corbelled parapets tending to complete the horizontal aspects of these buildings horizontally. But in street architecture the vertical grouping is very general, and instances of any other principle would be difficult to find and group, at the dawn of the Renaissance, which brought with it the use of the enormous horizontal crown or cornice.

Many examples remain in the Low Countries and in North Western Germany, as at Lübeck, Münster, in Westphalia, at Nuremberg, of the assiduous application of the vertical principle to narrow street fronts, executed in brick and stone, and collectively a more instructive exhibition of the innumerable possible combinations of simple forms upon one method of treatment. Of similar wooden architecture, where the horizontal principle of beam or lintel construction necessarily enters into construction and design, England furnishes examples in such as Chester, Shrewsbury and Tewkesbury, while in many there are many refined examples of beautiful half-timbered fronts. The application of a delicate artistic originality in emphasising and giving value to vertical expression can be observed in Mediaeval examples, and the employment of horizontal steps in the brickwork gables, so characteristic to us of the fifteenth century, is echoed in stonework examples in Westphalia; the Scotch corbie-stanes or crow's feet all subserve the same principle of design.

The advent of the Renaissance into Northern Europe did not, as in the South, bring the pedantic use of overhanging half-cornices into its less sunny clime; that was reserved for the pseudo Italian palaces which made the modern London of fifty years ago so gloomy, but allowed a great freedom of treatment in line and ornament, gradually casting aside from the craftsmen's methods of development from pure necessity by fitting and subduing all to preconceived notions of architectural effect. Swirling curves and disjointed architectural fixtures soon began to exercise themselves upon the surface of wall surface provided by the front with its gable, and it was not until the need of a new restraint began to make itself felt that the freedom of rococo treatment was reduced by the ready application of horizontal cornice lines over and under the storey of the façade.

#### *Picturesque Streets.*

The happy independence which was obtained by each front, by the vertical method of design was practically universal, and in the aggregate of a street view a charming grouping and freedom which has a fascinating effect, and always proves attractive to the artist follower of Prout and Roberts on his sketching tours. The more or less flexible curve of the lines of the eaves and gutters in a winding narrow street combine and contrast with the closely grouped vertical subdivisions of the house fronts, broken by the occasional projection of oriels or corbelled turrets, or in half-timber work by joist ends and brackets. The gable peaks in varying proportions, heights and positions, naturally form themselves into pictures without the aid of fancy or composition. The charm of a Mediaeval street has certainly within it a basis of reasonable beauty, and is attractive to us as modern street builders, which will bear the test of its antiquity and associations. These are of the qualities with which we cannot endue our designs, and without which we should compare the artistic effect of more modern streets, whether purposely architectural—as in the case of the sobriety of Moorgate or King William Streets—or

accidentally arranged on modern lines, as in Queen Victoria Street or Shaftesbury Avenue, with the earlier examples.

We do not wish to assume a universal artistic principle of street building design, for to do so would be to limit the illimitable possibilities of artistic combination and effect, but from impressions of result we may derive safely enough the conclusion that in narrow frontages a design should be self-contained, its lines terminating satisfactorily within their own field, and the direction which is to the eye unbounded, namely, the vertical one, is that in which the artistic sense of appropriateness can be best brought to play, while totally, the effect of a street or city built of independent but self-contained designs is pleasing, the separate fronts adding together picturesquely in the necessarily horizontal sum of street perspective.

#### *Uniformity and Symmetry, Regent Street.*

There are, however, many principles of design and ideas of symmetrical or picturesque arrangement beside those into the discussion of which we have gone at some length.

The principal consideration, in contrast to what we will call the Mediaeval independence of each frontage, is that of a uniformity compulsorily applied, either by that relic of Mediaevalism, most necessary and useful to architectural effect, the lord of the manor, or by special legislation. The underlying idea in such cases is the almost unproved assumption that uniformity of effect in street architecture is necessary in the interests of dignity and art. This whole doctrine of architectural symmetry has been courageously assailed by Gothic revival enthusiasts, its value denied, and its effects of repetition and gradation scouted as formal weaknesses alien to the picturesque and truly artistic. The present generation stands in many respects at the parting of the ways. The heat of Gothic vigour has evaporated, and we are prepared to consider its artistic assertions at least as coolly as we have regarded the orders and proprieties of the preceding school which produced Regent Street and the park.

Within the last half-century public taste, national genius, or what you will to call that will of the wisp, has romanticised into Mediaevalism with its guilds and crafts ideally uniting work with art in life, and not in vain; and also not in vain has it discovered the charms of the Bloomsbury and Soho view of art life, with its sober respectability of external appearance and delicious completeness within, reticent to plainness about the house and home, and serenely Athenian in monumental churches and porticoed institutions. While this sprite of fashion is at present dissipating her enthusiasms in a somewhat libertine interlude, we can do no harm by putting in a plea for the organised hypocrisy of Regent Street, with its many and various dispositions and subdivisions successfully masked in stately groups and blocks culminating in the magnificent Quadrant, new made annually with fresh paint in every architectural feature with whiteness of surface—and is not architecture mainly surface matter after all? The sense of scale, of grouping, of harmony and of successful regulation still survive in Regent Street, though well nigh three-quarters of a century have elapsed since it was designed, and of all London streets it is yet the only one of which, as street architecture in total, we can in any way be proud. We must not fail, though, to qualify our self-congratulation by the objections which lie below the surface, for they will practically prevent an entire repetition of the experiment. The stately grouping of varying blocks has been achieved mainly by the sacrifice of what to-day would be altogether too valuable, comfort in arrangement, and of market rental value in the "upper parts." There is a manifest wrestling between internal facts and external appearances, which struggles with windows, parapets and roof lines. The pleasant proportion of width of street to height of building will be rarely attained now in any great city, and the charm of curved line on which the whole street scheme is planned from St. James's Park to Langham Place is uniquely happy in its architectural effect. The effort was a great one, and the genius of Nash one for the occasion; the result is characteristic of the age that produced it, and serviceable and delightful to that which has followed. London would frankly approve of a repetition of the occasion, effort and genius, and of a result as expressive of our generation as that is of the "First Gentleman" of Europe.

#### *Speculative Building in Important Streets.*

A practical aspect of our subject sorely presses us to-day in London, and to some extent in all our larger cities. We have been considering the improvement of our street architecture upon definitions of the requirements of commercial buildings, and the way in which the architect seriously devoted to the advancement of his art can meet and give them artistic expression. These requirements postulate as a requirer, an intelligent progressive man of business, also a sympathetic and trained architectural mind to consider them. But practically neither the business man nor the architect have much to say upon the matter in a way which can affect street architecture,

for buildings are now ready made for them. These are the production—and as such also express the characteristics and ideals of their producers—of building investors who buy or secure the most prominent and serviceable sites and erect speculative shops and warehouses upon them as ready for occupation by the purchaser. I do not propose to take any exception here to the speculative purchase of land likely to become valuable, or to its being offered at the highest obtainable figure, and though it is gravely open to doubt whether the policy of providing ready-made buildings is the best and most profitable either for the promoter or purchaser, or for both. But I conceive it well to be within the proper limits of our subject to-night to protest in the name of our commercial men, in the name of architects, and of all passers-by who have regard for the pleasant, decent and beautiful character of the cities of our land, against the great speculative building blocks recently erected, and now being carried out, upon many of the most important sites in the Metropolis. The outrageous vulgarity of design, ignorance or defiance of elementary considerations of appropriateness of proportion, and of architectural suitability in expression, and the abominably bad ornamentation, are surely an artistic scandal of a serious kind. There seems to be no protection for the public, refined or unrefined, against the insults to taste and national self-respect which deface our finest and most important thoroughfares, through the sordid incapacity of grossly ignorant men. The architecture of the whole class of speculative building is normally of a low class, but since this element has invaded the more expensive sites and proceeded to erect buildings demanding the highest rents, the depths of the degradation of speculative building art have received a new exploration and exposure that is appalling. Kind nature makes us slowly oblivious to constant or recurrent physical pain; but, speaking from painful experience, I cannot discover any such alleviation in the doom of having to come into daily contact with buildings in high places exhibiting the worst effects of architectural degradation. Indeed, a settled despair of London, in spite of much in many directions to give bright hopes of oases of cheer in the desert, drops with chilling and deadly effect upon that zeal without which an architect is fairly useless to his fellows and his art. A really bad building is a upas tree, to be destroyed as rapidly as possible, and of the real badness of this branch of modern street architecture no one has any doubt. It is not even to be expected that the promoter, or even architect of such buildings possibly know or care that they are bad or good; their interests are otherwise entirely wrapt up in present profits; these are compelled. The buildings occupy certain positions and insure rents at no more or less, whether the architecture is a source of pleasure or pain to the citizens upon whom it is forced. We protest; if we can do nothing else we will make this beginning by crying revolt against a shamelessly bad architecture, a continued disgrace to our building art, commercial intelligence, national self-respect and civilisation. There are no good points, not even of arrangement and suitability or of improvement, in the design of these blocks, while their construction sails as near disastrous inefficiency as the administration of a difficult statute by hardworked and heavily handicapped district surveyors can allow.

#### *Regulation of Designs.*

In conclusion, it is not perhaps much good railing at a blot, however disfiguring upon the surface of a city, but as the mischief is spreading rapidly, we would point out again that while not limiting free trade if you will, in land of public or private importance, there is a definite call for such a censorship as liberal as you like, but cultured and wide, that will prevent the intrusion of ready-made or purposeless buildings of hideous and incompetent architecture as speculation upon our public streets. With goodwill some reference to authority of designs in important streets of distinctive character should be readily obtained. This at present exists by statute upon construction, height, purpose and accommodation, but not upon the more widely-dispersed, though less realised evil of bad design. There is as yet no sufficient standard of public taste to enable us to trust such censorship without fear of controversy in the hands of any mere officials, but having organised societies for the promotion of the fine arts and architecture and for the improvement of our cities, there should be no difficulty in obtaining sufficiently large committees of taste willing to proffer advice, criticism, and to exercise veto without illiberality or narrowness. There may be danger in this suggestion, the censorship may prove either a stork or a log to the frogs, but there are greater dangers in the continuance of the existing state of things, for some of the best streets of London are already marred and appear to exhibit a gross decadence of public taste, which is really as untrue as any other artistic characteristic of such buildings.

The London County Council happily, to some extent, seems alive to this danger in regard to the great thoroughfare which they have now in hand. It has proposed regulations for

buildings upon the new crescent towards the Strand, and held a tentative competition for uniform designs, that certainly marks a progression of ideas in the direction of proper control. But the subject is one of great difficulty and complexity; unless the control is in the first place wisely directed, in the true interests of successful architecture, by highly competent hands, and in the second is so entirely firm by enactment a covenant that it cannot be broken away from, the experiment will not be successful. These two conditions are not unattainable, and Londoners hope for much, as they always do in spite of much disappointment. Into the discussion of the great street from Holborn to the Strand, so full of detail and interest, we cannot now enter if we would. The preliminary work is far advanced for suggestions to be of much value to the authorities, but we can and do appeal to all who build in the streets, whether promoters, owners, men of commerce, speculation, or of public purpose, to employers, builders and architects alike, to consider how deeply important is the right use of every opportunity of permanent building to the whole city, and if character is written in stone, wood and iron, that character should reveal devotion to the highest ideals.

#### PREHISTORIC BRIGHTON.

AT the last meeting of the Brighton and Hove Natural History and Philosophical Society, held at the Royal Pavilion, Brighton, an interesting paper was read by Mr. S. Toms on "Some Prehistoric Camping Grounds near Brighton." Mr. Toms began by explaining, says the *Sussex Daily News*, that for some years past his favourite recreation had been to scour the county of Sussex in search of flint implements and such other material as enables the archaeologist to construct, by synthetic and comparative methods, a fairly accurate account of what were the crafts, arts, and customs of the prehistoric inhabitants. His object now was to give, in the nature of a preliminary report, one result of his local "flint hunting" expeditions during the past twelve months. He found that the best hunting grounds were the cultivated patches of downland in the vicinity of Cissbury. On his first visit he turned up no fewer than a dozen flint axes, three of which were perfect specimens. During another visit he was rewarded with an axe, a gouge, a dagger, and a large boring instrument, the three latter being rare types, hitherto unrepresented in the local collection of flint implements. An extended search in this district led to the observation that the axes do not seem to be scattered broadcast over the hills, but that they are confined to certain spots, and that where one finds a single specimen several others may generally be revealed by a diligent search, and was attended with the discovery that other prehistoric remains invariably and abundantly occur on these spots in close association with the flint axes, namely, flint flakes, cores, hammerstones, scrapers, needlemakers, arrow-shafts, &c., and also the calcined flints with which prehistoric man boiled water and cooked his food. The thousands of flakes were either chips struck from a flint to serve for scraping and cutting purposes, or produced during the fabrication of some flint tool. Not being able to make pottery, primitive man dug a hole, lined it with skin, put in water, heated stones in a fire, and threw the stones into the water to make it boil; hence stones called "pot-boilers."

Having described the differences between artificial chert of flint and natural splinters, and quoted Lord Avebury as saying that "a flint flake is to the antiquary as sure a trace of man as the footprint in the sand was to Robinson Crusoe," Mr. Toms said his own observations led him to the conclusion that this statement required some modification. A little practice, however, enabled one to distinguish between natural flaking, by the action of the sea, and the comparatively beautiful and thoughtful workmanship of the hand of man. Whenever they came across a symmetrical or well-formed flake which exhibited the portions of at least two facets on its outer face, then and then only, he thought, could they regard it as a sure trace of man. In the neighbourhood of Cissbury he had discovered three typical prehistoric sites—one on the crest of Lychpole Hill, about half a mile south-east of the entrenchment; another about 400 yards to the east; and another on the spur of the Downs known as Mount Carvey, which slopes from Cissbury towards Broadwater. Flakes, cores, scrapers, cooking stones, refuse axes, &c., were to be found in spots throughout the length and breadth of the last-named spur. He had also worked the Beachy Head district, and last year he came across a dozen men, women, and boys who were engaged in picking flints for road material from the cultivated land, and he found that, owing to their frequent conversation with collectors, they had all become possessed of sufficient knowledge to recognise a "war-stone" (a flint axe) whose value might represent anything from sixpence to as many shillings according to the excellence of the specimen and the length of the collector's purse. Last year he discovered that cooking

flakes, scrapers, &c., occur more or less in groups over the whole surface of the field opposite the Bird Museum on the Dyke Road, Brighton, to walk over which permission had been given him by Mr. J. J. Clarke. The other spot he had to mention was even more typical. It was situated in the open fields on each side of the Dyke Road just beyond the last reservoir (near the Three-cornered Copse); here he discovered several flint axes and perfect axes, and some of the most beautiful scrapers he had ever seen. The finest axe he had ever found he accidentally turned up about two years ago near the south-western summit of Newmarket Hill, known locally as Norton Top.

Mr. Toms thought that from the array of evidence they might deduce the obvious conclusion that these productive sites were frequented by the members of some primitive tribe, not only for the purpose of boiling water or cooking food, but for making their flint tools and preparing animal hides as well as for things, tent coverings, &c. Lacking a better term, he had, therefore, given these sites the name of "camping grounds." The problem now inviting solution was as to what period these camping grounds might be assigned. Judging by the nature of the "finds," many of them might have no hesitation in saying they might at once be relegated to a position in the Neolithic phase of the Stone Age. But they found there were authentic records of the abundant occurrence of burnt flint, or flint-boilers, in association with the remains of the Neolithic, Bronze, Early Iron, and Roman periods, thus showing that the practice of stone-boiling and flint-chipping survived together in the Neolithic period down to early historic times. A pottery sherd, flint-flake, scraper, &c., found on the surface of the Iwms might consequently belong to any of the above ages, and the difficulty of assigning even an approximate period to such surface finds would be apparent. He feared that the question of the probable age of the camping grounds bristled with difficulties. They had seen that it was not an infrequent occurrence to find hand-made pottery, cooking-stones, and the smaller flint implements with Roman and the so-called late Neolithic remains, and that where they are thus discovered they are invariably accompanied by numerous fragments of the pottery of the periods in question. The latter remark equally applied to the Bronze age, for, wherever the bronze-using Briton went, he seems to have taken his pots and pans with him, and if they might judge by the multitude of shards occurring with the remains, the ceremony of "washing up" in those days must have been often associated with drastic results. He associated flint-flakes, also, with the comparatively modern period when they were made for gun-flints.

In the hope that it might afford some clue as to the period to which the camping grounds belonged, he had been constantly on the look-out for the occurrence of pottery in any size or condition, but with one solitary exception he had utterly failed in this respect. The exception was the discovery of a small fragment of Romano-British pottery on the camping ground near the Dyke Road reservoir, but the utter invalidity of such a piece of surface evidence was singularly demonstrated by the immediate discovery on the same spot of another fragment of pottery which bore the magic inscription that a certain brewery was located in such-and-such a place. This combined discovery gave rise to the remarkable query as to whether the camping ground in question belonged to the period of the Roman occupation or to the flourishing period of Tamplin's ales. After such a preamble of conflicting theories he would in conclusion venture his opinion as to the age of the camping grounds. The fact that the flint axes found on these sites were purely Neolithic in character, and that they occurred there so abundantly as in association with the smaller implements and cooking-stones, coupled with the strong negative evidence which exists in the marked absence of pottery of any type or kind, seemed to him to point only to the conclusion that these camping grounds were distinctly those of the Neolithic tribes.

## ARCHITECTURAL COMPETITION IN AMERICA.

COMPETITION—"the life of trade"—has come to have a peculiar and impressive meaning for American architects. Most men who follow trades in New York, or do business for themselves, or who are building up a professional practice of one kind or another, says the *New York Times*, can tell you a thing or two about competition. In no other city is there so fierce and incessant, they will say, as in New York—the best city in the world for the skilled worker, and one of the best in the world for the man who has not trained his mind or his hands.

But to the architect competition has come to mean something more than the strenuous rivalry in which men of other trades and professions are engaged. He not only competes in the ordinary sense for the privilege of making a living. The bulk of the work he does nowadays is laid out for him on the basis of competition alone, so that the task set him and fifty others is one for which he receives a full reward or nothing.

"It's a curious state of things," said a New Yorker, who was graduated from the Beaux-Arts a good many years ago, and who has since been following his profession with considerable success in Manhattan. "I don't know of any other calling in which like conditions obtain. Hardly any building costing 50,000 dollars and upwards is erected nowadays excepting on plans submitted in competition. You will observe that I am so busy that I cannot stop work to talk to you, but keep on drawing while I speak. It would be just the same no matter when you called. I'm always this busy. I have to be, because so little of my work counts for anything. For example, my partner and I are at present engaged on plans for a public building in an Eastern city. For six weeks I have given two-thirds of my time to this work alone. Then there is the office rent, of course, and the salary of our draughtsman, whose weekly salary sometimes amounts to more than we are able to make ourselves. If one of our plans is accepted, we will make a good bit of money, and it will help our reputation. The architect receives 5 per cent. on the cost of the building he designs, and when all expenses are paid this yields him 3 per cent. net profit. The building we are making plans for now is to cost 1,000,000 dollars. So, if we are successful, we will ultimately divide 30,000 dollars between us. But you see there are from forty to seventy-five other architects after the same thing; and, as only one plan can be accepted, from thirty-nine to seventy-four members of the profession will have their work for their pains. But of course if one stopped to think about that it would paralyse his energy."

"And can a rejected plan be put to no other use?" he was asked.

"None whatever. It represents so much waste material. You will notice that drawing of a State house there against the wall. Isn't half bad, eh? Yes, the circling eagle was thrown in. Well, that cost me a full month's time and a considerable cash outlay in the bargain; and if you have some taste for art you can take it away with you for 25 cents."

"But is this not an exception?"

"I should say it was rather the rule. One year with another, I put in two-thirds of my time at just this sort of thing. Other architects do the same. Occasionally in these competitions a very few of the competitors whose plans were almost as acceptable as the winning one will be paid something to cover expenses. But it is only occasionally. Then it happens sometimes that a competition for which plans are making falls through because the would-be builders find themselves short of funds."

"Have these conditions always obtained?" asked the visitor.

"Not to the extent that prevails to-day, though competition in public buildings is as old as the country. Away back in 1792 a prize of 500 dollars or a gold medal of that value was offered to the man who should produce the most approved plan for the President's house at Washington. A like sum, or a city lot, was the award announced for the prize designer of a capitol, and even a second prize of 250 dollars was offered for the encouragement of architecture. Compared with those times we are doing pretty well, only of course there are more architects now."

"There are several faults to be found with the competitive system of to-day. In the first place, it is practised to excess. As I have intimated, architects can be gotten to submit plans for 50,000 dollar buildings. In such cases the system is worse than the method of public competition, because there are no judges, and, consequently, the conditions are not so fair. In only a few instances of this sort are all the conditions favourable, including an expert arbiter. And there we strike at the root of the evil, whether the structure is to cost 50,000 dollars or 1,000,000 dollars. No valid objection could be made against the competitive system were there always architects, instead of laymen, on the committee of award. As it is, the system is a bad thing for the profession, as it encourages too many incompetents to enter it. You see, to construct a good building is a test of ability, but to make a good drawing is comparatively a simple matter and easily accomplished by the tyro. So the committees of laymen are too often taken in, and, naturally enough, by mere sham—which is bad both for architecture and for the real architects."

"Is there sometimes a 'pull' as another element to contend with?"

"That almost goes without saying when public buildings are in question. And it reminds me of a sad case in point. A few years ago the American friends of a gifted young Parisian architect, whom they had studied with at the Beaux-Arts, persuaded him to send in a plan for a public building in a big Western city. His design was pronounced the best by the expert whom the committee had consulted, and he recommended that it be adopted. On the strength of that the Americans who lived in the Western city and who were themselves competitors sent for the Parisian to join them. But after his arrival the committee of award decided to ignore the expert's recommendations, and the design of another man, with

a political 'pull,' was adopted. I saw the young Frenchman some months later. His money was gone, he had no friends excepting the few of his own calling, and he was desperately trying to make a living as best he could. Probably he would have starved to death had not friends helped him to get to New York, where there was a better market for his work. And, after all, a part of his plan for the public building was used without credit or compensation."

"And the architects themselves, do they all live up to the ethics of their calling?"

The Beaux-Arts graduate smiled. "There are some queer things in all professions," he said. "Not long ago I called to see a lawyer for whom I was designing a dwelling-house. We had no formal contract, but he was satisfied with my plans and all was going well. In his ante-room I found an architect of my acquaintance, and on questioning him I discovered that he had come to submit plans himself, voluntarily. I explained the situation to him. However, he remained, offered his plans, and was then told what I had already told him. Afterwards, not to be balked, he forwarded the plans by mail. So competition, you see, is active with us in more ways than one."

"Competition in several senses is in fact so keen that a certain architect who had made headway enough in his profession to design one of the handsomest large buildings in a prosperous suburb of New York, some time ago announced his intention of giving up a profession in which he could not make a living and returning to his father's farm."

"Another, and a prosperous architect of Manhattan, who has finally found a secure footing, says that 80 per cent. of the architectural work in this big town is done by ten firms. For the architects who do the remaining 20 per cent. you may consult the directory. The list is not brief."

### The Piers of Truro Cathedral.

SIR,—The interesting report of Sir Thos. Drew in your issue of April 25 relating to the fractures in the nave piers of Truro Cathedral bears upon questions which have claimed attention here in New York. Study of the great stresses engendered in modern high buildings shows that there is one factor in the problem which may, I think, be added with advantage to those so well stated in the report. It is the elasticity and compressibility (under stress) of materials usually treated as rigid. The effect of a great load is that the materials are compressed where it is applied, and there only. Parts not loaded are not compressed; and if a mass is thus unequally strained it will measurably change its form. To make a pier capable of working to its maximum strength it, and its adjoining members, must be stripped of superfluous substance, which, if not under strain, will distort the mass by their excessive resistance. Refer to the diagram on your page 273. There is a rubble pier over 4 feet wide supporting a freestone base about 2½ feet wide (except at a shaft). The load upon the rubble at the plane of contact seems to be more severe than upon the freestone. I will assume that it is not excessive, but it is ill-applied, and the consequent distortion of the rubble has caused the failure of the freestone and not any defect of the freestone itself. This is proven by the fact that it is the base which cracks. If the column failed of its own weakness the crack would appear in the smallest part of the column instead of in the base, which is considerably larger. There is no load upon the edges of the rubble pier, therefore these parts stand higher than the loaded middle, and the elasticity of the mass causes it to assume a curved or dished form. The base stone being less elastic receives an added stress upon its outer parts and (the load being sufficient) cracks because of the development of transverse strain, and assumes a new condition of stress which may be more safe than the former one. But the task is now transferred to the next stone above, and the continuation upward of the crack will depend more upon the elasticity of the stone (and its bed joints) than upon its strength under compression.

The remedy for the original failure would be the cutting away of the superfluous rubble at the upper surface, giving the pier such an inclined face (or stepped face) as would preserve to all parts a due share of the load. A projection of one-quarter the height is probably all that can be allotted to stone-work of this class, when it is expected to distribute as well as transmit an extreme load to the course below, and this ratio will vary with the tensile strength of the material. If so gradual a reduction is improper because of the weakness of the rubble, then a stronger material must intervene. The concrete

cap, about 6 inches thick, cannot do the work required. It (and is intended to be) simply a cushion. What is needed is the elimination of the idle rubble which distorts the top surface of the pier.

Let me ask that this be taken as in no sense a criticism. Experiences very similar to that under consideration have led me to believe that the theory here advanced is valuable enough to be taken into account, and I hope it will make its own apology.—Yours, &c.,

ROBERT W. GIBSON.

New York: May 5, 1902.

## GENERAL.

**The King** has placed a stained-glass window in the private chapel at Windsor Castle as a memorial of Her late Majesty Queen Victoria. The window consists of ten lights in two tiers above the altar.

**Mr. Frank Verity** was presented to the King on Monday at St. James's Palace, on appointment as architect to the Lord Chamberlain's Department.

**Lord Iveagh** has invited designs from architects practising in Ireland for the erection of a market for the sale of old clothes at Dublin.

**Mrs. A. Lea Merritt** was elected a member of the Royal Society of British Artists at the last general meeting.

**Mr. Lacy W. Ridge** has prepared a report as to alterations and additions to St. John's Church, Lewes. The scheme, which includes improvements to the ceiling, windows, porch, &c., is roughly estimated to cost 900*l*.

**The Warden and Fellows** of Merton College, Oxford, have ordered the alabaster effigy of Walter de Merton, Bishop of Rochester, and founder of the college, to be replaced upon his tomb in St. William's Chapel, Rochester Cathedral. The figure was removed when the tomb was renovated by the wardens in 1849, and has since lain in an adjoining recess.

**A Committee of Old Etonians** unanimously decided last week "that a memorial to those who have fought and have fallen in the South African war should take the form of a building worthy of the school, together with a memorial recording the names in the Eton College Chapel."

**Mr. Walter W. Thomas**, deputy chairman of the Liverpool Corporation baths committee, is to read a paper on Thursday next, entitled "People's Baths," before the Society of Architects.

**The Glasgow Exhibition Buildings** were estimated to cost 163,000*l*. This estimate, however, has been considerably exceeded. At a meeting of the buildings committee a report was submitted showing that after final measurements the cost of buildings is 184,642*l*, in addition to which there is the cost of erecting the water chute and re-erecting a restaurant.

**A Memorial** of the late King Humbert has been erected on the Superga Hill, in the environs of Turin, beside the basilica containing the tombs of the kings of Piedmont. It consists of a conical column surmounted by a wounded eagle representing the House of Savoy. At the foot of the monument a figure representing an Allobrogian, wounded in the hand, stands with angry brow, menacing vengeance. The pedestal bears the date 1900, and beneath it King Humbert's name, surrounded by the aureole of martyrdom and an inscription.

**The Statue** to be erected by the Gladstone Memorial Committee is to occupy a site in the centre of the open space in the Strand between St. Clement Danes Church and the eastern horn of the proposed crescent block.

**The French Government** have at length decided in favour of accepting the collection of paintings and studies by the late Gustave Moreau, for the upholding of which a sufficient sum has been given by his executor, M. Henri Rupp. The building will be in the Rue de la Rochefoucauld, and will be officially known as the Musée Gustave-Moreau.

**The Foundation-stone** of the tower of the church of the Society of St. John the Evangelist at Oxford was laid last Monday. The designs of Messrs. Bodley & Garner provided for a building to cost about 12,000*l*. It is six years since the church was dedicated, but the erection of the tower was left to a future date, as the expenditure would be 3,000*l*.

**An Exhibition of Furniture** is to be held in the Grand Palais of the Champs-Élysées from July to November next. Other industries will also be allowed the use of the building at a subsequent time.

**M. Paul Renouard** has been sent by the French Government to make a series of drawings of the fêtes in honour of Rochambeau, which are to be held at Washington on the occasion of the inauguration of a memorial of the French general.

**Mr. Gordon P. Hills** has prepared plans for the enlargement of the chapel of Otter College, Chichester. The work is to be completed in twenty weeks.

Architect and Contract Reporter.

EDITORIAL NOTICES.

view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.

Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.

Authors of signed articles and papers read in public must necessarily be held responsible for their contents.

Communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.

COMPETITIONS OPEN.

REWE.—June 12.—Designs are invited for new municipal offices and council chamber. The author of the design which is judged best will receive a premium of 50*l.*, and he will be appointed to carry out the design; second premium, 25*l.* Particulars will be supplied by the Borough Surveyor, Municipal Offices, Crewe.

LEPTFORD.—Aug. 30.—Competitive designs are invited for town hall and municipal offices. Premiums of 100*l.*, 75*l.*, and 50*l.* are offered for the three selected designs. Mr. Vivian Ward, town clerk, Municipal Offices, 20 Tanner's Hill, Leptford, S.E.

HARTSHILL.—June 16.—The committee of the North Warwickshire infirmary and eye hospital, Hartshill, Stoke-upon-Avon, invite designs for a home for nurses at Hartshill, Stoke-upon-Avon. Particulars may be obtained on application to Mr. E. Boyce, secretary and house governor.

KNARESBOROUGH.—June 1.—The Harrogate and Knareborough Joint Isolation Hospital Committee invite competitive designs for an infectious disease (other than smallpox) hospital at Thistle Hill, Knareborough. Premiums of 100*l.* and 50*l.* are offered for the two selected designs. Mr. J. Turner Taylor, clerk, Municipal Offices, Harrogate.

LIVERPOOL.—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

SUNDERLAND.—Aug. 30.—Designs are invited for proposed police and fire-brigade buildings to be erected in Gill Bridge Avenue and Dun Cow Street. Premiums of 100*l.*, 50*l.*, and 25*l.* are offered for first, second and third designs respectively. Mr. Fras. M. Bowey, town clerk, Town Hall, Sunderland.

TOTTENHAM.—July 15.—Designs are invited for municipal buildings, fire station, public baths, &c. Premiums of 200*l.*, 100*l.* and 50*l.* are offered for the three best designs in order of merit. Mr. W. H. Prescott, surveyor to the Council, Tottenham.

WEST HARTLEPOOL.—June 27.—Competitive designs are invited for a new higher-grade school to accommodate 1,200 children, schoolkeeper's house, &c., proposed to be erected in Elwick Road, Eamont and Belmont Gardens, West Hartlepool. Premiums of 75*l.* and 35*l.* respectively. Mr. J. Robson Smith, clerk, School Board Offices, West Hartlepool.

CONTRACTS OPEN.

AXBRIDGE.—May 26.—For erection of a new infirmary (about sixty beds) on a site adjoining the existing workhouse, Axbridge, Somerset. Mr. A. Powell, engineer, 3 Unity Street, College Green, Bristol.

BELPER.—May 29.—For reconstruction of 241 feet lineal of surface-water brick culvert 2 feet 6 inch diameter at Kirk Langley. Mr. Robt. C. Cordon, surveyor, Hazelwood, Derby.

BEVERLEY.—May 21.—For erection of a pavilion for 120 patients and for alterations and additions to the administrative department of the East Riding lunatic asylum. Mr. C. H. Hebblethwaite, architect, 10 Waterhouse Street, Halifax.

BIRKENHEAD.—June 10.—For erection of a warehouse at Morpeth Dock, Birkenhead, for the Great Western Railway Company. Mr. G. K. Mills, secretary, Paddington Station, W.

BIRMINGHAM.—June 2.—For putting-in the foundations and lower storey of the buildings and the installation of a power station at the Birmingham University. Messrs Aston Webb & E. Ingress Bell, architects, 19 Queen Anne's Gate, S.W.

BIRSTALL.—May 22.—For erection of an infectious diseases hospital at Foxhall, Birstall, Yorks. Mr. J. W. Burrows, architect, Birstall.

BOCONNOC.—May 20.—For additions at the school, Boconnoc, Cornwall. Mr. W. Pease, solicitor, Lostwithiel.

BOOTLE.—May 21.—For alterations and additions to the 4th V.B.K.L.R. drill-shed and armoury, Park Street, Bootle, Lancs. Mr. J. Henry Farmer, town clerk, Bootle.

BOSTON.—June 2.—For additions and alterations to the isolated ward at the fever hospital in Skirbeck, Boston, Lincs. Mr. Jas. Rowell, architect, Borough Offices, Boston.

BRENTWOOD.—May 23.—For erection of a retort-house (75 feet by 40 feet), coal store (75 feet by 25 feet), boiler-house, engine-room, &c. Mr. C. A. Fielder, secretary, Gas Offices, Brentwood, Essex.

BRENTWOOD.—May 31.—For underpinning a portion of the chapel at the Essex County lunatic asylum. Mr. Frank Whitmore, architect, 17 Duke Street, Chelmsford.

SPECIAL VENTILATING GEARING  
FOR CELLS.

Can only be operated from outside, by the regulating movement, and cannot be tampered with inside the cell. Only one Ventilator is shown in illustration, but any number can be worked with the one movement.

FRED VERITY & SON, CALL LANE, LEEDS.

PRICES ON APPLICATION. [5]

We are also Manufacturers of Fanlight Openers, Skylight Openers, Espagnolette Bolts, Door Checks and Springs, Window Gearing of all kinds, Casements in Wrought-Iron or Gun-Metal, &c., &c.

THE Clydebank public baths, which form part of the municipal buildings scheme of the burgh, are now open. The building, which is situated opposite the new town hall, is a continuation towards the south of that appropriated to the fire brigade and firemen's houses. The pond, which is lit by means of a glass roof and the electric light, is 50 feet long by 25 wide. There are twenty-four retiring boxes for swimmers, and a gallery runs along the sides of the pond, as well as at the top end. The scheme also includes twelve slipper baths, eight of these being set apart for men and four for women.

**TRADE NOTES.**

MESSRS. ANDREW HANDYSIDE & CO., LTD., bridge roof builders, of Derby, have secured the contract for 400 tons of steel rings in connection with the new harbour works at Folkestone.

THE new scarlet fever block of the Sanatorium, Wigan, being warmed and ventilated by means of Shorlands' double-fronted patent Manchester stoves in glazed faience, supplied by Messrs. E. H. Shorland & Brother, of Manchester.

WE have received a new price list of steel hearth boxes of which Messrs. Statham & Sons, of Windsor Bridge, Salts, make a specialty, and for which they claim that it is really fixed, thoroughly effective and reasonable in price.

THE vicar and churchwardens of Sherburn-in-Elmet have ordered of Messrs. Wm. Potts & Sons, clock manufacturers, Leeds, a new Cambridge quarter-chime clock for their parish church tower as a permanent memorial of the Coronation, has to be working on Coronation Day.

MR GEO. WRAGGE is sending out a circular relating to his new Wardry casement, for which he claims that it retains the flat appearance on the outside which was a feature of iron casements used in the old houses of the Renaissance period, and at the same time they are guaranteed weather-tight in the most exposed positions.

MESSRS. MALKIN, BINNS & FOSTER, of Halifax, write that since beginning business some four years ago in the manufacture of woodworking machinery and appliances they have had to continually add new plant to cope with the increasing demand for their improved machines, and the pressure has now culminated in their having to remove to new premises comprising four times the working area they previously occupied. Their new works are at Haugh Shaw Road, Kirk Cross, Halifax.

MESSRS. J. H. SANKEY & SON, Essex Wharf, Cannon Town, have sent us a circular relating to their improved slip trap, for which they claim the following advantages:—Being made of best glazed imperishable stoneware, it will not corrode or become offensive; its inlet and outlet are in the same alignment; it supports its own weight; it is easily fixed by any workman; no plumber is required, as with lead trap; effects a saving of expense in fixing; has a clearing inlet; a special secure screw stopper; an effectual water seal; and its cost is only 3s. 6d.

the danger of fire in large institutions is always serious, the loss of life which has unfortunately occurred in the as led the authorities to take special precautions. One best is the provision of portable hand fire apparatus, so any outbreak of fire can be dealt with promptly, and the Metropolitan Asylums Board has evidently recognised this, for have just placed an order for over 160 Merryweather hand pumps to be placed in London fever hospitals.

## BUILDING AND BUILDERS.

DATION-STONES have been laid of a new church and in connection with the Burnley Methodist Free Church

r Shaw, near Oldham, corner-stones have been laid of a Primitive Methodist chapel which is being erected, at a of 1,500l., on the site of the old chapel, built in 1835.

reports be true, a mania for hotel construction has struck York. No fewer than ninety hotels of various sizes are paid to be in course of construction, or will be before the of the year, at a total cost of 40,000,000 dols.

NEW Roman Catholic church is about to be erected at ford Hill. The work will be carried through in three the first, which will be undertaken immediately, is the ing of the chancel and transepts and the first bay of the . The dedication will be to St. Ignatius.

r Monday's meeting of the Johnstone (N.B.) Council, ost Lang in the chair, a number of competitive plans were e the Council relative to the extension and improvement e town hall. The plan marked No. 1, in the opinion of e town Council, was the best, and it was found this was by Robert M'Lelland, architect, Bath Street, Glasgow.

HE foundation-stone of a new Baptist chapel at Atherton, s, was laid on the 10th inst. The chapel will occupy the of the old building in Tyldesley Road. Seating accommoda- will be provided for about 700 people. The total cost will out 6,000l., 4,600l of which had been raised prior to day. At the ceremony and meeting which followed 378l. realised, and an effort is to be made to raise 1,000l. by a r in October.

A MEETING of the Strathdon (N.B.) Parish Council was held on Saturday, when a report, drawn up by Mr. Ross, Glenkindie, on the state of the wooden bridge over the Don between the church and Bellabeg was laid before the meeting and considered. As the report was to the effect that the bridge was no longer safe for vehicular traffic, the Council agreed to obtain estimates for the construction of an iron bridge, leaving it to a future meeting to determine whether the work should be proceeded with or not.

THE foundation-stones were on Saturday laid at Derby by the mayor (Alderman Woodiwiss) and the two borough members (Sir Thomas Roe and Mr. Richard Bell) of a Friendly and Trade Societies' hall. The premises, which are to be most up-to-date in character, will include a hall, to be called St. George's Hall, capable of accommodating 1,300 people, besides numerous lodge-rooms and rooms for social intercourse.

THE Kirkcaldy School Board have decided to proceed with the erection of a new elementary school in connection with the high school, and competitive plans have been received, and a special meeting of the Board has been called to make a selection. The Board are being pressed by the Department to proceed with the extension of Kirkcaldy technical school, and competitive plans for this work have also been received. It is estimated that the building of the two schools will entail a cost of about 20,000l.

AT last week's meeting of the Mersey Docks and Harbour Board a tender was accepted for the construction of a new graving dock in connection with the Herculeum system, at the extreme south end of the Board's estate. The successful tenderers were Messrs. Baldry & Yerburch, contractors, Westminster. It was stated that the new dock was to be about 740 feet long, and that it would occupy two years in construction. The amount of the successful tender was not mentioned.

AT a numerously attended extraordinary general meeting of the shareholders of the Imperial Insurance Company, Ltd. (Fire), a resolution was unanimously passed to adopt the agreement for the fusion, upon the terms and conditions arranged, of that company's business, goodwill and assets with those of the Alliance Assurance Company, Ltd.

# TUBOR" FILTER

Architects are invited to  
see these Filters  
in operation  
at our Showrooms.

ANDREW WILSON writes as follows:—"The 'Tubor' Filters sold by the Berkefeld Filter Co., Limited, London, W., remove all germs from water. They therefore represent ideal filters, giving pure (i.e. germless) water, and thus prevent Typhoid and many other diseases."

**BUILDING ACCIDENTS.**

IN the yard of Messrs. Good & Sons, builders, on Monday afternoon, some men were engaged in removing a log frame saw, weighing about 4 tons, by means of a travelling crane, when the supports collapsed and the saw fell upon Frank Spencer and John Claxton, killing them instantly. Two other men, who were standing near the crane, were terribly injured, one having both legs broken and the other sustaining a serious internal hurt.

A SERIOUS accident occurred at a building in course of erection in Middleton Street, Ibrox, Govan, by which an apprentice bricklayer, named Andrew Bulloch, seventeen years of age, lost his life. He was working on the top of the north gable when he slipped and fell to the ground, a distance of 35 feet. He alighted on a heap of bricks, and received terrible injuries, from which he died in the Western Infirmary.

ANOTHER accident occurred at New Street station, Birmingham. The roof of the station is being painted, and a scaffold builder named Patrick Jordan was engaged, at a height of about 90 feet from the ground, in the construction of a scaffold for the painters. He missed his footing and fell backwards. He tried to get hold of a portion of the scaffold, but failed to get a sufficient grip, and he fell on the metals below, his head being terribly mangled. Death was instantaneous.

**VARIETIES.**

THEIR Royal Highnesses the Prince and Princess of Wales paid a visit to Rhyl on Monday for the purpose of opening the new Royal Alexandra Hospital.

It was announced at the Bournemouth Town Council meeting on Wednesday that there were nineteen applications for the new post of town clerk at a salary of 1,000*l* per annum.

THE death is announced as having occurred on Tuesday last of Sir George F. Duckett, Bart., in his ninety-second year. Sir George Duckett was a well-known archaeologist, and a frequent contributor to the proceedings of the antiquarian societies of Cumberland and Westmoreland.

THE freedom of the Plumbers' Company has been presented to Mr. Andrew Carnegie as a medium for the expression of national sentiment in regard to the enlightened method and exceptional magnitude of his benefactions in aid of higher education.

IN the Kirkcaldy post office, which has been in course of construction since the beginning of October 1900, premises most suitable for the growing postal business of the burgh have now been completed. The premises, which occupy a site in Hunter Street, are in the Scottish Baronial style of architecture, and built of selected white stone from Grange Quarries, Burntisland, at a cost of nearly 8,000*l*.

THE following gentlemen have been selected to appear before the Derby Town Council on June 4, when the appointment of town clerk will be made:—Mr. W. H. Andrew, aged forty, town clerk of York; Mr. G. T. Lee, aged thirty-eight, town clerk of Dewsbury; Mr. F. C. Lloyd, aged forty-one, town clerk of Huddersfield; and Mr. H. M. Robinson, aged thirty-six, town clerk of Shoreditch.

AT the recent examinations of the Surveyors Institution held in Glasgow, the following candidates qualified for membership: As Fellow—J. C. Peace, P.A.S.I., Kerse estate office, Falkirk; as professional associates—T. R. Cane, Craighall, St. Andrew's; Donald M'Lean, jun., Rhives, Golspie; G. Orr, Portland estate office, Kilmarnock; as students—J. V. Makins, 79 West Regent Street, Glasgow; John T. Craighall, Whitsome Hill, Chirnside (exempted from examination on production of leaving certificates necessary to satisfy the Council).

AT the close of last week's meeting of the Pollokshaws Town Council, Provost Leckie, who presided, made allusion to the fact that this was the last meeting of the Council which Mr. Campbell, town clerk, and Mr. Prentice, his deputy, would attend. He expressed the regret of the Council at parting with one who had served them for upwards of thirty years, and hoped that Mr. Campbell would enjoy many years of health and prosperity. Mr. Campbell and Mr. Prentice acknowledged the kindly expressions of the Council.

THE new church of St. Paul in Kimberworth Road, Rotherham, was consecrated on the 8th inst. It is to take the place of the mission church established in Midland Road some years ago. The site contains 1,320 square yards. The present building is only part of an important scheme, the plans for which have been prepared by Messrs. Stock, Page & Stock, London. Accommodation is now provided for 250 persons, and, when funds permit, two additional bays have to be added to the nave and side aisles erected. The total cost of the church as it now is is 2,800*l*. The builders are Messrs. Thornton & Son, of Rotherham.

**PARTRIDGE & COOPER**

LIMITED,

191 & 192 FLEET STREET, LONDON, E.C.

COMMODOUS new drill hall, &c., for Nos. 11 and 12  
nies of the 1st Norfolk Royal Garrison Artillery (Volun-  
was opened on Friday last at Harleston, Norfolk. The  
the new buildings is a plot of land near the railway  
where from the designs of Mr. A. Pells, of Beccles, a  
of premises has been erected by Mr. A. F. Rayner, the  
ctor. The buildings comprise a large drill hall 100 feet  
th by 40 feet in width and 36 feet high in the centre,  
by a skylight running almost the entire length of the  
ontiguous to which are a dwelling-house for the instructor,  
noury, officers' room and store.

THE annual exhibition of work executed in the Board  
s of London will be held at the Examination Hall,  
ia Embankment, W.C. (adjoining Waterloo Bridge), on  
esday, June 18, and the three following days. The  
ion will be opened by Lord Reay, G.C.S.I., G.C.I.E.  
nan of the Board), at 3 o'clock P.M., and will include  
ens of drawing, colourwork, modelling, woodwork,  
arving, metalwork, needlework, infants' work, cookery,  
y, housewifery from the day and evening schools,  
rom the schools for the blind, deaf, and special instruc-  
nd also work from the truant and industrial schools.  
will also be included scientific apparatus which has been  
ected by the teachers and pupils.

NEW Wesleyan church has been formally declared  
at King's Norton, Birmingham. This building,  
forms part of an important scheme of extension which  
ast year entered upon by the Birmingham Wesleyan  
dists, was designed by Messrs. Ewen Harper & Brother,  
Birmingham, and built by Messrs. Harley & Son, at a total  
f about 3,500*l*. It is a nave and aisle structure, providing  
modation for 500 worshippers, and built of brick with  
facings, in the Tudor Gothic style of architecture. A  
spire raised to a height of 80 feet from the ground gives  
dignified appearance. The principal entrance has a  
ed and traceried archway, with mullioned window above,  
side spaciousness is imparted by the open timbered roof.  
has been left for extension by the addition of a chancel.

THE annual business meeting of the Glasgow local section  
Institution of Electrical Engineers was held on Tuesday  
ing in the hall of the Philosophical Society. Professor  
us Maclean presided. The report by the committee  
that the papers submitted during the session had all  
of a very high standard, and the publishing committee of

the parent institution had already published the president's  
address, Mr. Murray Morrison's paper on "Aluminium," and  
Mr. J. C. A. Ward's paper on "Mains," with the discussions  
that took place upon them. There was a net increase of  
thirty-one in the membership of the section, which now stood  
at 189. Office-bearers were appointed as follows:—Past chair-  
men, Lord Kelvin and Dr. Magnus Maclean; chairman, Mr.  
Henry A. Mavor; vice-chairman, Mr. W. A. Chamen; and  
hon. secretary and treasurer, Mr. E. George Tidd.

THE new Corporation baths which have been erected in  
High Street, Bolton, were opened on Saturday last. They  
adjoin the public library, and have a commanding frontage of  
about 112 feet, with two ranges of windows. The structure is  
of local brick, with Ruabon red terra-cotta dressings. The  
basement contains a large boiler-house and other usual  
accommodation. The plunge bath, which is on the ground  
floor, is 75 feet long by 26 feet wide, and is arranged in  
accordance with the rules of the Swimming Association.  
There are thirty-nine dressing-boxes, shower bath, attendants'  
room, &c., with a gallery over these for the use of visitors on  
the occasion of aquatic galas. The roof of the plunge bath is  
of the lantern type, of iron and glass. Nine slipper baths for  
men are provided on the same floor, the women's slipper baths  
being on the upper storey. A capacious laundry is furnished,  
and the caretaker's house is at one end of the main building.  
The entire pile has a neat and substantial appearance. The  
fittings and general equipment of every department of the  
interior of the baths are of the most complete and modern  
character, thoroughly adapted for their purpose. The archi-  
tect is Mr. R. Knill Freeman, the general contractor being  
Mr. John Halliwell, also of Bolton.

At Horwich, Lancs, on the 8th inst., a new church was  
dedicated to St. Catherine. The site of the new building is  
near Chorley New Road, and the portion completed consists  
of lofty nave, side aisles, vestries, and temporary chancel,  
leaving transepts, side chapel, chancel, and east end to be  
added at some future time. The present part provides about  
600 sittings, which number will be largely increased when the  
church is completed. In the basement a large parish room is  
provided, also lavatories, &c. Externally the building is in  
local brick, with red Ruabon terra-cotta dressings and north  
country green slates with red ridge. The windows are filled  
with lead glazing of ornamental design, and the clerestory  
walls are finished with rough-cast, the lower walls being faced  
with pressed brick with internal dressings of red Rainhill stone.

Contractors to His Majesty's Office of Works, War Office, and Admiralty.

The inside woodwork is of pitch-pine, left unvarnished, the inner boarded ceilings, which will be waggon shaped, being left to be carried out at some future time. The floors of passages to aisles are of red Ruabon tiles, and the main entrances are at the west end, handsome internal screens of pitch-pine fitted with lead glazing being provided to each.

BULFORD Church, Wilts, the chancel of which has been carefully restored at a cost of 300*l.*, was reopened on the 8th inst. The church is an ancient edifice of stone and brick in the Early English style, consisting of chancel, nave, north transept, south porch, and a western tower containing two bells. The earliest part of the church is the chancel, which has windows of the twelfth century. The chancel arch is also Norman, and the north wall of the nave cannot be much later. It is thought that the great south porch is probably of the thirteenth century, and must have been intended for a tower. The restoration which has just been completed forms only a part of what has to be done as funds permit. The foundations have been underpinned and made secure, and the walls cleaned and thoroughly renovated. The old plaster ceiling, which covered a beautiful moulded oak roof, has been removed and the roof has been carefully repaired, new work being put in where necessary. The east window has been restored. The old stone mullions had fallen out, and they have been replaced by wooden ones, and part of the window had been built up with bricks. In carrying out the work some interesting discoveries have been made. A squint has been revealed in the north side of the chancel wall, and on removing the plaster it was found that the walls had originally been coloured. A portion of the wall has been left uncovered to show the colouring. The open roof is a distinct improvement to the church, and with the renovated windows the chancel now presents an appearance which will be pleasing to all who take an interest in the old building.

THE fine old church of St. Peter, Corby, Northants, has just been thoroughly restored under the care of Mr. J. C. Traylen, A.R.I.B.A., of Stamford, at a cost which has exceeded 3,000*l.* The fine old edifice has been thoroughly restored throughout, the new work being done as far as possible to harmonise with the old, which is about the fourteenth century date. All the roofs are of oak, that of the chancel being very handsomely carved, and all representing a free treatment of fourteenth century work. All the windows have been releaded, the old quarry glass being replaced as far as possible. A new

stained-glass window has been erected in the west end of new north aisle by Messrs. J. Hardman & Son, of Birmingham, the cost of the same having been borne by the Reunion and congregation in commemoration of the reopening of church. The whole of the church has been re-seated with pine of New Zealand pine, the seats being covered with felt. The old west gallery has been removed, and a new north aisle added giving seating accommodation for an additional ninety persons. In constructing the new north aisle the old wall has been taken down and superseded by three arches supported by octagonal pillars, while the old windows have been inserted in the outer wall. The chancel has been refloored with mosaic tiles, those under the altar being blue and black in zigzag fashion with gilt corners, the remainder being in black and white, and of the signs of Alpha and Omega. A new porch has been erected of pine, and the whole of the interior fittings are new. A new pulpit has been added, this being of alabaster Weldon stone, with a beautiful carved figure under the canopy representing St. John the Baptist.

THE demolition of the old lantern and dome of the Rock lighthouse is now being proceeded with. The octagonal wall which forms the light-room has yet to be removed, and this will take a considerable time, as the large stones will have to be broken into smaller pieces before being cast into the sea, so that no damage may be done by the stones washing against the cast-metal landing piers. Temporary light is now in operation. Not for ninety years since the lighthouse was built—has the light been changed. It is a comparatively small light, only half the strength of new flashlight which is to be permanently placed in the tower but it is an excellent piece of mechanism, the lens forming lantern itself, and a small clockwork machine underneath revolves the shade round the light, giving the characteristic red and white flash every half minute. The whole apparatus stands about 4 feet high and weighs about 3 cwt. A temporary pole has been erected from which to explode the fog signal when necessary. The beautiful old machine and case, along with other material, have been removed to Grant but the two fog bells still occupy their position on the balcony. It is understood that both bells and machine are to be sent to the Edinburgh Museum.

# ROYAL OPERA HOUSE IMPROVEMENTS.

the commencement of the Coronation season at the House the owners have seen the completion of their extensive scheme of alterations and improvements, which included much of a structural as well as of a mechanical and artistic character.

The owners, the Grand Opera Syndicate, Limited (directors Mr. Grey and Mr. H. V. Higgins, and secretary Mr. Neilson), have had three years for the development of the scheme, the lease of which was purchased from Mr. Faber in 1899, the ground landlords being the Bedford Estate. The work was executed piecemeal, generally between the festive opera seasons and ball seasons, and the architect was Mr. Edwin O. Sachs, who in many respects also acted as engineer.

The exact figures of the expenditure are not available, but most of the work must have been considerable, as it affected every part of the structure, and included much of an expensive character, such as the entire re-equipment of the stage with modern mechanism and the entire lighting of the house by electricity. In respect to the execution of the work, we believe Mr. Sachs had the co-operation of a well-known German expert, Herr Brandt, for a portion of the stage-work, whilst Mr. Wingfield Bowles was responsible for the electric lighting of the house.

Numerable contractors were employed during the progress of the works, and among them were primarily—the builders, Messrs. Colls & Sons, of Coleman Street; the engineers, Messrs. Drew-Bear, Perks & Co.; further, the Thames Bank Works and Engineering Company; Messrs. Townsend, Martin & Makovski for the electric lighting; Messrs. Merryweather as fire engineers; and Messrs. Bertram as decorators.

The extensive alterations place the building on an entirely new footing, both in respect to its position as a property and its position among the opera houses of the world. That the house should be so unfortunately situated in a thoroughfare of the character of Bow Street in the midst of market produce is, of course, regrettable, but once within the doors of the theatre there is nothing to be found that does not meet with the ideas and requirements for an opera house.

The works executed under the direction of Mr. Sachs

extended as already stated from 1899 to the current season, and their nature is enumerated below from notes and particulars we have been able to gather from the progress made from time to time.

With the important work of the remodelling of the stage, offices, stores and wardrobes we dealt at some length a year ago, since when other important works have completed the scheme. Important amongst these is the electric lighting of the front of the house, where the principal corridors, the saloon and lounges are now electrically lighted, gas having almost been done away with. The gas chandelier has been replaced by a number of pendant electric lights which are very effective; they are run in two circuits planned in the form of two rings. The fittings are of a neat pattern. The switch-board for this part of the house is fitted independently of the stage switch-board, and has been placed below the vestibule on the Bow Street side, with access by a stalls corridor.

The rearrangement of the stalls, with new exits and the provision of a special stall corridor, was an improvement of considerable extent. This alteration gives the auditorium additional seating accommodation, *i.e.* two new boxes and some forty additional stalls. The stalls are now provided with three exits.

The exit to Floral Street for the pit and first tier box-holders has been remodelled.

New entrances have been cut into the Bow Street portico, and thereby the whole of the carriage arrangements have been greatly improved. The time occupied in filling and emptying the theatre is materially reduced.

The saloon has been improved by the addition of some large pictures and general redecoration.

A conservatory lounge has been constructed over the main porch. It contains bars, and affords accommodation for smoking. It was constructed by Messrs. Barker.

The warming and ventilation scheme of the auditorium is on the Plenum system. By adopting the Plenum system, and doing away with the large chandelier which acted as an outlet in former years, the state of the draughts will no doubt be improved. The fans for the ventilation scheme are electrical fans, for which special mains have been run.

The orchestral alterations involved picking up the front of the stage with some light girders supported by steel columns, a space having to be formed underneath in the front of the stage to take a number of musicians.

The improvements in the decorations include the Royal

box, Royal approach and Royal smoking-room. The corridors have been redecorated in green. New upholstery has been provided throughout, including the tip-up seats.

The installation of a red-silk drapery curtain by Messrs. Bertram in the proscenium opening has materially altered the appearance of the house in a satisfactory sense.

The sanitary arrangements have been thoroughly overhauled, and the principal lavatories added to and ventilated. The appliances are Doulton's. Several Blackman fans have been used to assist the ventilation.

The office accommodation at the corner of Bow Street has been remodelled, and now comprises an outer office, a secretary's-room, a director's-room and a telephone-room, with approaches both from Bow Street and Floral Street. The management, further, have now at their command an elaborate system of public and private telephones, speaking-tubes and bells. Every part of the house is now in close touch with the management. The box office has been provided with private telephones from the libraries, and a private telephone to the nearest fire station has also been installed.

A large asbestos curtain has been provided between the auditorium and stage, and was constructed by Messrs. Merryweather. The total area of the screen covered with asbestos is 3,286 square feet. The total weight of the ironwork is about 7 tons, and the counterbalance weighs about 2½ tons. The curtain can be worked either from the stage or from the stage-door keeper's room.

The above describes shortly the extent of the work; individual sections of it may still call for comment on a future occasion.

The Grand Opera Syndicate have shown a progressive spirit in undertaking these extensive operations, and Mr. Sachs, the architect, the various consultants, and the stage management, in whose hands the modernised building has now been placed, should be proud of the opportunity that has been offered them.

### THE AMERICAN GENERAL CONTRACTOR.

As our building operations become more complex and expensive, says the *Architectural Record*, new agencies must be employed to render them more effective. With the increased cost of structures has come the necessity for more perfect mechanical appliances for handling materials, a more highly

developed system of operating and more effective capacity handling men in large numbers. A few years ago the construction of a million dollar building was regarded as a great undertaking, but to-day there are numerous buildings in New York the cost of which involved the expenditure of several millions. The modern builder is not only architect, but engineer and artisan as well. In the field of construction he is an operator whose training demands the manipulation in a broad and general way of the whole operation, and the handling of the minute details as well. One of the most flattering evidences of competence in a builder is to have a contract awarded him on merit of his work rather than the fact that he is the lowest bidder. This speaks far more than any testimonial that was written, for it shows in the most practical way that his work is worth more to a client at a higher price than that of his competitors. Such a compliment was recently paid to Charles T. Wills, and no man has taken so large a part in revolutionising the building trade of New York. After plans for the New York Stock Exchange were finally accepted the question came up as to who should have charge of construction. Some of the committee suggested that the work be let to the lowest bidder, but this suggestion was not received favourably by the majority. They preferred to place the important work in the care of a builder whose works are accepted as the highest type of building construction. Representing an expenditure of three million dollars, with its construction embodying the highest achievements of modern engineering, the building committee of the Exchange were unanimously choosing for this important work Mr. Charles T. Wills, and architect, Mr. George B. Post, heartily endorsed their selection. The class of buildings being erected to-day is different from the character of the buildings ten years ago, and each presents a special problem. The builder of to-day must be both engineer and architect. He must bring to bear on difficulties which confront him a trained mind, with superior powers of organisation and fertility of resource.

Building in New York has from the beginning been regulated by economic considerations. Ever since the city acquired metropolitan characteristics the work of the builder has been increasing in importance. In no other city in the world has so much capital been used in producing residences and structures dedicated to commercial and pleasure pursuits. The yearly cost of building in the city of New York amounts to more than the yearly cost of the food for its inhabitants. So the builder is prominent in the metropolitan field. The ca

is not far to seek. The enormous increase in land and the improvements made in building construction earned the buildings erected in New York thirty years to simple encumbrances. It is not a unusual thing in New York to see a handsome commercial building torn down to make room for a modern sky-scraper, which will prove profitable.

Less than twenty-five years a new architecture has been devised and perfected among us that has practically revolutionized all previous methods of construction. The problems confronting the builder to-day are of such a widely different character from all that the world has ever known before, that they constitute a new era of engineering science. And it is here they are the most varied and difficult problems that the world ever had to face, because they necessitate greater knowledge, experience, skill and resources than any nation of men ever had, or dreamed of having, that no fair-minded judge would hesitate to accord the modern New York the very foremost place in all the history of his profession. The high buildings in New York to-day are the architectural features of the city. That they are the safest in the world has only to inquire the rates of insurance on them to prove.

The difficulties both of design and construction encountered in our new public and commercial architecture fill pages, but our builders have attacked the problems of construction, overcome every obstacle and silenced every opposing voice. They have erected more imposing structures and contributed more new knowledge of constructive engineering than the world had learned in centuries before. We shall attempt to describe all the work that Mr. Wills has done, but shall allude to the most important of his contracts. From his apprentice days he has had a liking for the more serious problems of the structural arts, and his ability to overcome obstacles that would be the despair of less able men has secured him the favour and liking of the most prominent architects. To-day it requires that the contractor shall be not only a man of the most unquestioned financial responsibility, but also one of superior organising powers and fertility of resource to meet the difficulties that are sure to arise and which cannot be foreseen. Mr Charles T. Wills has carried out a long number of important contracts, including the finest office buildings, club-houses, railway depôts, residences, apartment houses, churches, factories and theatres, and to-day has many large contracts on hand for office buildings particularly. Among his numerous new contracts we must not

forget the building to be erected on the corner of Pine Street and Nassau, which will be an addition of which New York may well be proud.

### AN AMERICAN HOSPITAL.

THE Commissioners of the District of Columbia have selected Frank Miles Day & Bro., of Philadelphia, as the architects to furnish the plans and supervise the construction of the magnificent new municipal hospital to be built at head of Thirteenth Street, Washington, D.C., which will be, says the *Architects and Builders' Journal*, the handsomest and best equipped in the world. They will serve for a term of years, receiving compensation in accord with the final cost of the buildings.

Mr. Edmund Wheelwright, of Boston, the professional adviser of the commissioners, who is an expert on hospital matters, says that the plans show a thorough study of the subject, the problems of the situation being dealt with in masterly fashion. The front of the main building suggests old Independence Hall at Philadelphia. The building is capable of economic treatment or elaboration in accordance with the appropriations which Congress may make.

Mr. Frank Miles Day is one of the national officers of the American Institute of Architects, and is president of the local chapter in Philadelphia. He and his brother designed the magnificent new operating amphitheatre for the College of Physicians and Surgeons in Philadelphia, said to be the largest amphitheatre of its kind in the world, and having a seating capacity of 500. They also recently designed the Horticultural Building in Philadelphia, and have been engaged on many other important works.

The computed cost of the new hospital is now placed at 3,000,000 dols. The site is a beautiful piece of rolling woodland of some thirty acres, situated on Brightwood Avenue, directly at the end of Kansas Avenue, down which it will look, and adjoins the magnificent public park system of the Capitol, the Soldiers' Home being not far to the east.

The central group of buildings will be arranged about a quadrangular court on Brightwood Avenue. Directly opposite the gate of entrance will be the administration building, 200 feet by 60, flanked on the one side by the surgical building and on the other by the medical and autopsy building. Each of these will contain an amphitheatre seating 200, and will measure 200 by 80 feet. The style of architecture of this

group, as well as of the thirty-three other buildings which will complete the hospital settlement, is the Georgian, red brick and Indiana limestone being used in all.

### THE BIRMINGHAM ASSOCIATION OF MECHANICAL ENGINEERS.

ON Saturday last a large number of members of the Birmingham Association of Mechanical Engineers paid a visit to Kidderminster and inspected the steam turbines at the British Electric Traction Company's generating station. Arriving at Kidderminster at 2.43, they were received by Mr. W. Griffiths, the company's chief engineer, who took them up to the station in two of the electric cars, which were reserved for them. The turbines at the station, of which there are two, were supplied by Messrs. C. A. Parsons & Co., of Newcastle-on-Tyne, and develop 500 h.p. The turbine engine is an attempt at quite a radical change, and seeks at one swoop to get rid of all the reciprocating parts, such as pistons, rods, cranks and side-valves. The high speed of revolutions which is admitted to be so desirable becomes at once attainable to such an extent that no less than 2,500 revolutions can be obtained with safety. The leading idea of the invention which is to effect such great changes may almost be said to be that of a windmill, adapted of course to the action of steam, which is capable of such great control and of such steadiness of supply as compared with that of the proverbially fickle element. A very large number of curved vanes, shaped very like the blades of a screw propeller, are affixed to the shafting in regular order and gradation. The part of the shaft thus fitted is enclosed in a steam-tight chest. The inner side of this chest is filled with similar vanes, which, when the chest is in position, fill up the space between the corresponding vanes on the shafting. The chest being closed, on the admission of steam at its end the jet impinges on the row of blades nearest to it, and they bar the movement. The blades fixed to the chest cannot, of course, make way for it. Owing to their shape, however, the others are impelled to turn aside, and in doing so they naturally cause the shaft to which they are attached to revolve. As they do so the steam first admitted works past them and begins to affect the following series of blades, and so on. The continued supply of steam prolongs the action upon the front row. Thus all the rows are quickly brought into action, and the speed of revolution increases till the full power of the steam supply is at

work and the engine attains its maximum speed. After inspection the party proceeded by the cars to Stourport, where tea was provided at the Tontine hotel. The president, Mr. Conaty, took the chair, and was supported by Mr. J. Cox and Mr. E. Hazel, past presidents. A cordial vote of thanks was passed to Mr. A. Lycett for the permission so kindly accorded to inspect the station, and to Mr. W. Griffiths for his courtesy to the party during the visit. The return to Birmingham was made by the 7.31 train from Kidderminster, a very enjoyable day being spent.

### NEW YORK SCHOOL PLUMBING.

THERE are in Greater New York over 400 public school buildings in charge of the committee on buildings of the Department of Education. In them, says the *Engineering Record*, the plumbing is supervised by a sanitary engineer, and in the older structures much of the installation has been replaced or modified to conform to modern practice, which the new buildings provides for numerous requirements beyond the usual toilet necessities. For this service various standard fixtures and details have been adopted, some of which are of special interest for other locations than school houses.

The Wadleigh High School in Harlem furnishes an example of quite elaborate work. Here water is supplied from two street mains through 3-inch traps with lead pipe and gate valve connections to galvanised iron screwed pipes to the pumps. Where these pipes pass underground or through concrete they are lead, and near boilers they are invariably galvanised iron. There are air chambers near the street main connections, and the house mains are connected to a No. 2 Hart gas-engine pump and a triplex Douglas direct-connected 3 by 4-inch electric pump. The pumps are cross-connected and discharge into 12-inch cylindrical chambers 4 feet long from each of which there are 2-inch risers to each of two rectangular steel storage tanks in the attic. The tanks are cross-connected and are respectively 10 by 10 by 8 feet and 9 by 9 by 6 feet. They have 1½-inch flange-connected outlets and supply all fixtures above the first floor. The electric pump is controlled by an automatic high and low-water switch at the tank, which is enclosed in a fireproof box, and the pumps are enclosed in canvas covers with straps and buckles. The wash basins, janitor's sinks and shower baths are supplied under tank pressure with hot water heated by a basement heater.

## WESTMINSTER, S.W.

circulation pipes to a 40-gallon galvanised iron boiler. There are two main hot-water risers and circulation pipes, each with an expansion joint in each storey and with vents opening into the storage tanks above the water line.

The fresh air inlet box for the main trap is supplied with controlled by a stop and waste cock inside the cellar.

The court-drain catch-basins are supplied with cold and with steam. Water supply pipes between floors are protected and covered with canvas; where they extend through the floors of pupils' closets they are enclosed in cast-iron pipes flush with the ceiling and extending 4 inches above the level. No pipes are enclosed in walls or partitions or are covered with plaster, wood or otherwise concealed. The feet of vertical soil, waste and vent lines terminate with T-pieces of the same size with screw plugs for cleaning out. Each floor drain is supplied with water through a  $\frac{3}{4}$ -inch common hose bibb cock and gate valve, both with removable handles. Outside rain-water leaders have at their feet 6 feet of rectangular cast-iron pipe. After completion all soil, waste and vent-pipe lines are cleaned by a wire brush, and are subjected to both smoke test and pressure test from water filling the pipes to the top of the vertical lines.

The drinking fountains have special faucets with self-closing push knobs which are adjusted to deliver when open a jet of water from which the pupil may drink without touching the faucet with the lips. The overflow wastes into a soapstone basin with a raised convex strainer waste. The chemical and physiological laboratory sinks are of Alberene stone with overflow, in cast-iron waste pipe, trap and fittings. The former are supported in bridle irons and have extra heavy pantry faucets, controlling gate valves and hose nozzles. Sinks in the biological and physiological laboratories and elsewhere are of cast-iron with cast-iron backs and overflows, and are supported in cast-iron brackets. They have wrought-iron waste, brass compression flange, hose bibb faucet and air chamber. The photographer's sink in the dark room is made of Alberene stone, supported on iron brackets, has cast-iron waste, brass pantry faucet and two extra heavy brass pantry faucets with hose nozzles and controlling  $\frac{3}{4}$ -inch brass gate valves. Adjoining this sink is a wooden trough lined with 5-pound sheet lead with burned seams. The trough is supplied with cold water through three  $\frac{3}{4}$ -inch brass compression faucets, and has a trailing overflow and a 1-inch lead waste pipe connected through the end of the stone sink by a brass street washer nozzle.

The toilet-room on the fifth floor is fitted with shower baths essentially like those for public school No. 1 at the corner of Oliver and Catherine Streets. The fourteen shower-bath rooms, about 3 feet by 6 feet in plan, are arranged in a double row, back to back with the showers set on the dividing partition. Underneath this longitudinal partition there is an open floor gutter towards which the floor is pitched from both rows of bath-rooms. The floor is of cement pitched to strainers, and calculated to be flushed with a hose. The end partitions are carried to the ceiling, and the intermediate ones have an open space above them and are covered over the tops of the rooms with galvanised wire netting in removable channel iron frames.

The doors have spring butts to keep them open normally. Each room contains a solid concrete seat under the shower, a pair of japanned clothes-hooks secured to the top rail of the door, and a rubber curtain which divides the room into a dressing and bathing compartment, and is supported with rings from a 1-inch iron pipe curtain-pole, which is secured by wall flanges to the partition slabs.

The showers are of a special pattern. Each is set in an inclined position, and has narrow slotted holes instead of circular spray openings, thereby producing flat instead of needle-shaped jets. The heads are nickel-plated, and are set, as shown in the detail, on galvanised-iron frames bolted to the partition frames, and have  $\frac{3}{4}$ -inch branches to the  $1\frac{1}{2}$ -inch hot and cold-water supply pipes. Each supply branch has a quick-opening lever-handle valve operated by a chain pull and commanded by a gate valve. The hot water is connected to the cold-water supply branch between the cold-water main and the shower, so that no hot water can be used until the cold-water valve is opened, thus preventing the danger of scalding the bather, but permitting the temperature of the water to be graduated by mixing hot and cold in any proportions up to half and half, or to use cold water only at the choice of the bather. A check valve is put on the cold-water supply branch between the hot-water connection and the main supply connection to prevent hot water from backing up into the cold supply main, and both branches are connected to the shower with unions, so that the latter may be easily removed. In the girls' baths the hot and cold-water branches have vertical extensions below the valves, and are fitted with flexible tubes and nozzles so that the water may be sprayed over the body by hand without using the shower and thus prevent wetting the hair.

PLASTERER & MODELLER.

CONCRETE FLOORS AND IN SITU PAVING A SPECIALTY.

Telephone No. 689 Leicester.

The partition slabs 7 feet high have iron supports, and are raised a few inches above the floor. They are made of wire glass, with iron frames connected with iron angles and supported on angle-iron bases embedded in the floor concrete. The doors are made with 1-16 inch sheet iron, and have inside latches which may be raised if necessary from the outside by inserting a metal rod in a vertical slot across the latch. In some other schools the partitions are made of Alberene stone slabs fastened together with nickel-plated brass angles, bolts and washers, the bolt-heads being countersunk and covered with litharge and glycerine. The tops of the partition slabs do not extend to the ceiling, and the space above them in the plane of the doors is filled by wire netting.

The water for the shower-baths is heated in a 530-gallon horizontal cylindrical boiler supplied with a steam coil and having connections to an independent heater which has a 5-inch horizontal smoke-flue. This flue is connected into a tee in a vertical 12-inch cast-iron hub-jointed vertical pipe on the outer surface of the exterior wall. About 4 feet above the ground-level this pipe is reduced to 10 inches and extends with that diameter to the roof. The 12-inch pipe is only about 10 feet long and its lower end terminates in an elbow and horizontal section which passes through the wall and is closed inside the building by a screw cap. All accumulations of soot drop down into the foot of the 10-inch pipe, below the connection with the heater flue, and can be easily cleaned out by removing the cap.

In some instances there is danger of storm water backing up into the sewers, and a special swinging check valve has been designed to be placed between the floor strainer and the trap to prevent the water from entering the basement. The flap is made to swing very easily and care is taken to set the strainer plate exactly horizontal, which insures the valve seating itself and remaining always closed except for a flow of water into the sewer.

Janitors' sinks are made of Alberene stone mortised into the stone floor slabs, which thus answer for the sink bottoms. This makes a very simple, strong sink, which is easier to use especially for emptying pails of water than one which is elevated, and has no space underneath to catch and retain dirt and dust. The floor slab is a single piece continuous over the whole area of the alcove or closet in which the sink is placed, and is pitched to wastes inside and outside. These wastes have screwed flanges and lock nuts and strainers, and are trapped to the soil pipes. The closet walls are panelled with Alberene stone slabs 4 feet high, one of which forms the back

side of the sink. Wherever possible a narrow space is between each side of the sink and the wall, to afford room for brooms, &c.

In some schools troughs are provided for the model pupils in which they may wash their hands or mix the cement. When iron sinks were used for this purpose difficulty was experienced from the waste-pipe and trap being obstructed by the large quantities of clay sediment, so an arrangement has been devised where the clay or muddy water is received in a long narrow stone trough and the overflow must pass over a sort of catch basin, which intercepts the sediment before it is discharged into an open sink at a lower level, which is trapped as usual into the soil or waste-pipe. Both the overflow and waste discharge directly over a cast-iron sink which is set with the upper edge overlapping and close to the under side of the end of the trough. The overflow is a short flanged thimble with two lock nuts and gaskets, screwed up tight against the stone slab, and an elbow at the outer end to make a spout over the sink. The trough is 7 inches wide on the bottom, inside, and at the outlet end is a sediment basin, 10 inches square and 13 inches deep inside, suspended from the trough by a horizontal top flange gasket and bolted to the stone slab. At the bottom the corners of the basin are filleted in to a circle and threaded to receive a screw cap. This basin is found efficient as a trap which collects the sediment and leaves the overflow effluent nearly clear.

The drinking fountains have one or more jets set horizontally on the wall just above the upper edge of a stone sink supported on stone brackets and having, when more than 6 feet long, intermediate iron brackets, as shown in the detail. The sink is set over a stone floor slab 4 feet wide which is drilled to a strainer and waste pipe, and the sink has a waste pipe with a special flange connection to the bottom slab and a very heavy convex strainer, which screws into the inside of the upper edge of the brass waste outlet.

The attic storage tanks have standing overflows, and former trouble was occasioned by wood and rubbish which fell into the tanks and floating over the tops of the pipes obstructed them so as to prevent a free discharge. To remedy this the tops of the overflow pipes are now fitted with hemispherical caps attached to curved arms screwed to the inside of the tank and the outside of the pipe.

Mr. C. B. J. Snyder is the architect for the school building and Mr. Wm. H. Dewar is the sanitary engineer for the Board of Education.

## THE WEEK.

RE lately mentioned that a test case had been prepared by the District Surveyors' Association and the Westminster City Council in order to have the position of the surveyor defined in respect to the inspection of the seats which are now being constructed for the use of people who are desirous to see the Coronation processions, and more especially in Westminster. Three questions were proposed for the consideration of the Court, viz.:—(1) Whether the powers, duties and liabilities of the surveyors with respect to the supervision or inspection of wooden structures falling within section 84 of the London Building Act, 1894, had been transferred to the City Council and its officers; (2) whether wooden structures falling within section 84 were works of which the district surveyor should have a notice under section 145, and as to which he had duties of inspection and supervision independently of the terms of any license; (3) whether the right to receive the fees for such supervision and inspection had been transferred to the City Council and its officers, or had lapsed, or was still retained by the district surveyors independently of the terms of the license granted. The answers given by the Lord Chief Justice, and in which Mr. Justice DARLING agreed, were as follows:—(1) In so far as the duties depended on the terms of the license, it is not a question of transfer. It was a question of duties imposed on the officers of the City Council by the terms of the license. Therefore the district surveyors did not have the right or power of performing the duties imposed by the license unless the license expressly imposed duties on them. The answer to the question was that they were not transferred, and the district surveyors had no powers, duties, or liabilities under the licenses which were granted by the City Council. (2) He thought that the district surveyors were entitled to have notice under section 145 of the London Building Act, 1894, but not of all the things specified in that section, because they were not all applicable. He did not mean to suggest that the district surveyors could exercise functions which had no relation to the character of the structure being erected. (3) The right to receive the fees clearly had not been transferred to the City Council and its officers, but he did not think that the right had altogether lapsed. The reasonable and proper thing would be for the County Council to exercise their powers of allowing a less fee because the duties would be less. If in a proper case a district surveyor, for good cause on information received, had a duty to inspect, in order to see whether any provision of the Act had been infringed, he would be entitled to his fees, but he did not suggest that the district surveyors would be entitled to claim fees in respect of every one of these structures because they had certain duties under the Act.

MR. JUSTICE CHANNELL considered the answers should be:—(1) Nothing had been transferred, but so far as any duties would formerly have been imposed upon the district surveyors by the licensing of such structures to the County Council, no such duties were now imposed on them. (2) The structures were works of which the district surveyor was entitled to have notice. (3) If, in any case, the surveyor did inspect properly and not go to the purpose of getting his fee, he was entitled to his fee. The proper way for the County Council to meet this case was that, as the operation of taking away the licensing from them was very greatly to diminish the duties which would fall on the district surveyors, the County Council should make a direction, under section 150 of the Act, imposing a smaller fee to be given to the district surveyor in cases where the structure was licensed by the other authority. It cannot be said that the judgment is as clear as is desirable, but it is evident that the powers and duties of the district surveyors are diminished, but to what extent has not been fully defined. A district surveyor is entitled to his fees, but only in "proper" cases. Whether the decision of the Court will affect other structures besides those now in process of construction for temporary use has

yet to be determined. At present it might be considered there was responsibility resting on the district surveyors, but their freedom to perform the duties it involved is restricted, and will be paid for on a diminished scale.

THE amazing productivity of RUBENS is well known. It seems incredible how he was able to paint so many pictures, and at the same time to give attention to diplomacy. Nor was he ever a veteran, for before he reached his sixtieth year he was deprived of his power of painting by gout. M. MAX ROOSES, who is devoting himself to researches for the biography of the painter, has been able to demonstrate that RUBENS also was a student of ancient and modern literature, and could be considered as one of the scholars of his age. His father was compelled to fly from the Netherlands to Cologne and then removed to Siegen, where the painter was born. By his father, who was a lawyer, he was taught Latin. When his mother returned to Antwerp after her husband's death, RUBENS was only a boy of eleven. She destined him for law, and in consequence he studied the classics, and was well acquainted with the works of VIRGIL, CICERO, PLUTARCH and TERENCE. He entered as a page in the household of the Countess LALAGNE, but at his own desire he became a pupil of VERHAEGHT, a landscapist. After a time he studied under VANSEN, and in his twenty-third year he went to Italy. He lived for a long time in foreign courts, but when busiest he contrived to find time for literary studies. After his return to Antwerp, a visitor found him in his atelier almost as much engrossed with LIVY as with the picture on his easel. His contemporaries valued him not only for his pictorial power but for his knowledge of history and archæology. He spoke several languages besides Flemish; among them were Italian, which he preferred; French, which was then the language of diplomacy; Spanish; and, in fact, could hold conversation with natives of all the countries he visited. He had so great a love for antiquity, says one of his early biographers, that his agents purchased throughout Italy a prodigious quantity of statues, medals and precious stones. Whenever he sought repose it was in the contemplation of them. His collection was reckoned as among the most valuable in Europe.

THERE is no branch of engraving which has so many claims to be considered peculiarly English as mezzotint. The origin of it is commonly ascribed to Prince RUPERT, but ELMES may have been correct when he said:—"The mode of impressing pictures by light and shade on copper, commonly known by the name of engraving in mezzotint, owes its improvement, if not its origin, to WREN. WREN's nephew, in the "Parentalia," wrote of his uncle:—"He was the first inventor of the art of graving in mezzotint, which was afterwards prosecuted and improved by His Royal Highness Prince RUPERT, in a manner somewhat different, upon the suggestion, as it is said, of the learned JOHN EVELYN, Esq." Whoever was the inventor, there are no mezzotint plates which are superior to those which came from English hands, and of which an admirable collection is now on exhibition in the Gallery of the Burlington Fine Arts Club. Examples will be seen by JAMES MCARDELL, the Dublin engraver, who was a favourite with REYNOLDS, for he suggests the master's broad style, and on that account no doubt Sir JOSHUA said he should be immortalised by him. But he also engraved after other masters, English and foreign. His works, however, never gained him admission into the Academy. Another excellent interpreter of REYNOLDS was VALENTINE GREEN, who, although he received lessons from a provincial line-engraver, was self-taught as regards mezzotint. WILLIAM DOUGHTY was also successful in his prints after REYNOLDS. GREEN was painter to GEORGE III. RAPHAEL SMITH was engraver to the Prince of WALES; his plates were in such demand that he became a publisher, and one of his speculations was the Morland Gallery. He must always have worked in a hurry, and perhaps he never acquired the monumental character of MCARDELL or GREEN, but there is undeniable charm about his portraits, especially when the subjects were fine ladies. One of his pupils was WILLIAM WARD, who was excellent in his translations of MORLAND and other artists. The art is not difficult to practise, and could easily be popularised.

## THE NEW "UNDERTAKERS."

AN expression in the old schools was, "Beware of a man of one book." It signified that a student who set extraordinary value upon a single treatise was likely to make it a centre or kernel of knowledge around which he was able to aggregate whatever was remotely, as well as closely, related to its subject. The best knowledge is one of relations, and there is no doubt that the simplest thing can be made to serve almost as well as the most important for the purpose of a collector or of an assimilator of wisdom—that is to say, a scholar. Judging by what has occurred since 1897, it would not be unreasonable to assume that the Workmen's Compensation Act is destined to act like "the one book" of former times, and to become a nucleus for a body of English law of almost immeasurable extent. This arises from the slovenly manner in which the Act was drawn. As Lord BRAMPTON has said, the Act "is so framed as to provoke rather than minimise litigation, and those who were responsible for the language of some of its enactments little knew the amount of labour they were entailing upon those whose duty it might be to interpret them."

The Act was intended to simplify the arrangements for compensation to workmen who suffered through accidents caused by an employer's defective organisation. It was only necessary to make application before a county court judge, and unless there was a kind of opposition that was not anticipated the amount of compensation to be paid could be determined quickly and without much cost. But already there is a startling array of cases under the Act, and a great many have not yet reached final decision. They are in various stages of procedure, and at a later period some will be gradually brought to light when the round of the courts is over. For example, the significant appeal case in which judgment was given in the House of Lords on Friday last, related to an order that was made by a county court judge as far back as October 1899. The case has therefore been dragging its slow length along during two years and a half, and as lawyers know, there are other actions which have been passing from tribunal to tribunal through a longer term.

The issue to be determined in the case in question appears to be of the simplest. Messrs. COOPER & CRANE in 1899 entered into a contract for the erection of a building; they sublet the slating to a man named WRIGHT. One of his labourers, named BRADY, was engaged in carrying slates when a lift broke, and he sustained injuries which caused his death. The widow sought compensation. Messrs. COOPER & CRANE did not dispute their liability as contractors. They sought, however, an indemnity from their sub-contractor. The county court judge held their claim was justified, and gave judgment in their favour. The sub-contractor appealed, and the Court of Appeal exonerated him because he was not an "undertaker" within the meaning of the Act. The question which has taken over two and a half years to decide is, What is an undertaker under the Workmen's Compensation Act?

If an architect were called upon to give an opinion, he would be likely to say that in all cases relating to scaffolding, lifts, gangways, cranes and the like it would be preferable in the majority of cases if the responsibility were cast upon the general contractor. Aids and appliances of that kind are often costly, and a sub-contractor, who may be only an energetic workman without plant, when he is compelled to form a temporary structure will endeavour to have it of the simplest and least costly form. Sub-contractors' men sometimes are not of the class which trades unions protect, and they incur risks which the regular building workman would never face. In preparing the Act it might have been easily enacted that sub-contractors' liability in most cases should be confined to labour, but the legislator rarely thinks it is necessary to seek the advice of specialists. If the Workmen's Compensation Bill had been revised by a committee of architects and builders, litigation would have been greatly diminished, and in fact would only occur under unusual circumstances. But the Act is now beyond remedy, or at least years must elapse before an amended Act can be passed.

It may matter little whether there is doubt about the party who is to pay 217½, but as we have remarked, the unlucky Workmen's Compensation Act seems to be a

magnet which attracts a great many puzzling points in law, or, rather, it has the fatality of making points puzzling which were hitherto supposed to be familiar and plain. For instance, in endeavouring to define what was the meaning of undertaker, Lord BRAMPTON said that there were two sets of persons who might be assumed to occupy that position, viz. "The building owner who takes upon himself the construction of the building he requires, or the persons who, through the medium of a contract with him, engage to take upon themselves the obligation to execute that work for him." His Lordship carefully refrained from touching on the subject of the responsibility of a building owner, which implies the possibilities of a wider sphere for litigation than has heretofore been utilised. The Lord Chancellor, on the contrary, declared himself to be uncertain about the meaning which Lord BRAMPTON attached to the phrase "building owner," and it may hereafter cause some trouble before the term receives its new signification in reference to the Workmen's Compensation Act. We do not like to contemplate anything that will alter the value of terms used in building, and for that reason we are obliged to consider the judgment given in the House of Lords.

The Parliamentary draughtsman who employed the word "undertaker" was introducing a designation which was not customary either with architects who supply the materials for contract deeds or with solicitors who prepare the deeds. It was not contemplated to make any change in building routine, and the term should therefore be taken as a synonym for a word which has been already used. Now, an undertaking implies the existence of two parties, viz. the party who undertakes or contracts to build and the party who undertakes in return to pay the amount agreed on. If the former should make arrangements for subletting a part of what he undertakes, we have a transaction which is independent of the party who has to pay, or, in other words, of the building owner. The latter or his representative, the architect, can only in the majority of instances regard the sub-contractor and his assistants as ordinary workmen. He cannot compel them to execute better work or employ more expensive materials, for they have not entered into any undertaking with him or with the building owner. Accordingly in everyday building practice the undertaker in the eyes of the builder or his architect is simply the man who signed the contract deed, and is known commonly as the general contractor, and who, from assuming that position, becomes responsible for his sub-contractors and their men. It is unnecessary to say that the employment of a sub-contractor can be prohibited or become allowable only by the consent in writing of the architect. The legislators to whom we are indebted for the Workmen's Compensation Act must have been acquainted to some extent with the conditions of building routine, and they were hardly likely to attach much responsibility to men whose existence was problematic, and who in many cases would not be in a position to pay compensation.

In the fourth section, in spite of the astounding looseness of the phraseology, it is stated that the contractor, which means the general contractor, is to be liable in respect of any accident arising out of or in the course of any employment by a sub-contractor, just as if he were the direct employer of the men injured. The arrangement is a departure from the ordinary common law, which limits a man's liability to his own servants. In return it is provided that the undertaker or general contractor "shall be entitled to be indemnified by any other person who would have been liable independently of this section." We cannot resist saying that we believe the compensation offered by the last provision was not to be wrung from sub-contractors, who generally are not men of means, but was aimed at the building owner, in the expectation that by some negligence on his part or on the part of his architect he could be held responsible for accidents. Lord BRAMPTON'S views may not go so far, but he says that if it had been intended that sub-contractors should be considered as undertakers, with all the obligations which followed, "it is impossible to suppose it would not have imposed those obligations and expressed such intention in clear, intelligible language."

Lord DAVEY, in his judgment, said that in the definition of undertaker, which he admits is of little assistance in

construing the Act, he does not find anything which requires the undertaking or engagement to be directly with the building owner or excludes a sub-contractor to whom the contractor for the whole building has let a certain portion of the work. Such a person, he adds, undertakes the work he has engaged to do as literally and truly as if his contract was directly with the building owner. These words may be interpreted as meaning that a contractor is entitled to abandon the time-honoured practice of his business, and to enter into contracts with others without the knowledge of the building owner or his representative, and the sub-contractor in consequence becomes an undertaker. His Lordship admits that it may be difficult in the case of a building to suggest when the sub-contractor may or may not be an employer to whom the Act applies. If his Lordship had in his purview recognised the existence of other matters besides those connected with the Workmen's Compensation Act, we venture to think that by placing a sub-contractor on the same footing as a contractor the organisation for building is likely to become exceedingly complicated. Under present conditions we have to deal with the general contractor alone, and by allowing him to make arrangements of his own without authority a way is opened which can cause incalculable inconvenience to all concerned in building operations.

The Lord Chancellor, who usually takes a very practical view in the interpretation of Acts of Parliament, was not happily inspired in dealing with the case. He seemed to be eager to confute the whole of the reasoning on one side by an *argumentum ad absurdum*. His Lordship assumed that no one undertook the construction of the building, and then an accident occurred. Who was liable? The answer he supplied was that nobody was liable, and the workmen would have no remedy. If there was no one to construct the building it is not clear to us how an accident could arise, even in supposition. There is no question that the general contractor is made responsible for any compensation which may become necessary, but it is not clear that the Act intended that a sub-contractor was to be elevated to a contractor in order to repay the sum awarded. To architects it is of little importance whether the general contractor is repaid or has to deduct the amount of compensation from his profits, but it is a serious concern for them in the interests of the building owner if a sub-contractor over whom they have no authority should be recognised in law as a contractor, and at the same time be free from the responsibilities which are usually imposed on those who accept that duty. Even Lord BRAMPTON was not able to realise all the consequences of the point at issue, for he said:—"In most cases I have no doubt it is immaterial to the building owner whether his undertaker employs his own materials and workmen or engages another to do isolated portions of the work for him; but the building owner has no contractual relations with the sub-contractor, and can only look upon him as a mere employé of those with whom he has himself contracted." It makes, however, a very material difference, for the sub-contractor is rarely recognised (we exclude the cases where specialists and attendees are engaged) by the architect, and is unknown to the building owner. To place a man who is without direct obligations to the building owner on a level with the general contractor is an innovation which is not likely to be advantageous to the class of sub-contractors, or care will have to be taken that those undertakers alone are employed over whom architects have direct control. Then, as on the Continent, contracts are entered into for each trade, there is little difference in the positions of the various classes of undertakers, but at present, at any rate, England adheres to a long-standing custom in building, and until it has ceased arrangements on a different basis are unnecessary. However, the judgment of the majority of the House of Lords must be respected, and a contractor entitled to claim an indemnity for compensation from his fellow-undertaker, who formerly was known as his sub-contractor, but is now elevated to a higher grade through his obscurity in the Workmen's Compensation Act.

## RESTORATION IN FRANCE.

WHEN describing the proposal for an imaginative restoration of the church of St. Michael, Linlithgow, we referred last week to the method adopted in France. In the new number of *L'Art* there is an earnest protest from M. CARL, the sculptor, relating to restoration in general, and especially of the cathedral of Saint Dié, which confirms our conclusions about the defects of the official French treatment of ancient buildings. The case cited by M. CARL would be considered an extreme one, for at Saint Dié the different styles or transformations of French architecture from Gallo-Roman times to the middle of the eighteenth century were embodied. For the historian of art it was, therefore, a compendium of French work exemplifying the changes of taste, but as a consequence of the extraordinary variety of the parts, it presented to the purists of the Historic Monuments Commission the spectacle of a multitude of excrescences which should be removed without hesitation and replaced by imitations of the earliest style. The purists have succeeded. The old church has been deprived of the characteristics which were imparted to it by several generations of Frenchmen, but it is assumed to be nearer to its original condition. In other words, the works of many artists have been disturbed in order that a theory of a nineteenth-century official about the appearance of the cathedral six or seven centuries back may be expressed in enduring materials.

Saint Dié is not known to English tourists. It is found in the Vosges midway between Nancy and Colmar, and therefore close to the frontier. Strangers have an uncomfortable notion about the risks of travelling in the border region, which of late years has caused the beautiful city of Nancy to be avoided, although work is to be seen there unlike any found elsewhere in France. Saint Dié having fewer attractions is generally neglected. It always seems to have been treated as an out of the way place, and on that account the cathedral possessed peculiarities which called for preservation. For instance, before it was recognised as an episcopal seat, the *grand prévôt* exercised the authority of a bishop, and that office was so esteemed that princes of Lorraine and high nobles were proud to accept it; even a pope was, it is said, at one time provost of Saint Dié. In course of time the world might place a lower value on the position, but the clergy would endeavour to uphold their rank. In theory, at least, they would regard themselves as still lords of Saint Dié and its dependencies, although the real power had passed to secular hands.

One of the features which was most obnoxious to the eyes of the Historic Monuments Commission must have originated in a survival of the self-esteem of the clergy. An altar at the end of the choir was removed, and in its place was erected the episcopal throne. The change was made in the early part of the eighteenth century, when there seemed to be no restraint on the extravagances of the Rococo. It is, therefore, not difficult to imagine the character of the baldachin and other surroundings of the throne. The aim was to avoid all created examples by exhibiting as many unexpected curves as could be devised. Above, the mystic triangle was introduced amidst clouds and cherubs' heads, but attached to it we see emblems which might have appeared over the doorway of a military fortress. In Nancy JEAN LAMOUR, the blacksmith, twisted iron as easily as if it were a reed, and at Saint Dié the stucco-workers were still more enamoured of curves and turnings. The usual precedents for the arrangement of the bishop's chair were set aside; but Gallicism claimed to have a power of its own in church affairs, and it would probably have been maintained that what was done in placing the bishop as the terminating point of the axis of the cathedral rather than at one side was in keeping with primitive ritual. M. CARL said the respect for the bishop was not diminished by his becoming the central figure of the cathedral, and the faces of the old canons bent over their breviaries were in no way affected by the neighbourhood of the capricious arabesques.

M. CARL raises a larger question when he asks why the ornament and sculpture of the time of LOUIS XV. should be considered less fitting for a Christian church than Gothic ornament. The sculptors of the eighteenth century produced representations of apostles, prophets, evangelists, cardinal and theological virtues. Were not the figures

preferable, from their suavity, to those of Mediæval artists, in which demons were seen as the agents for punishing not only ordinary mortals, but kings and queens, monks and bishops? The curves and counter-curves could only by imagination be looked upon as profane; they had not the severity of the vertical lines and mouldings of the Gothic artists; but, for all we know, congregations may have been as indifferent to one as to the other. It is absurd to suppose that at any time laymen or clergy in churches scrutinised details as if they were travelling students of architecture who wished to gather suggestions for future use.

A sculptor cannot, it must be allowed, be taken as an adequate judge of architecture or of architectural ornament. His standard of excellence is the human figure, and the variations in it which are possible are comparatively few in number. The Mediæval sculptors at one stage conformed to peculiar types which seem to be as stiff and immovable as parts of columns, but in course of time they sought after a nearer approach to reality. M. CARL can believe in the excellence of the sculpture of the LOUIS QUINZE period, but with that sculpture came architectural details which are marked by a divergence from similar work of the Gothic fashion. The baldachin and its surroundings are valuable if we accept them as evidence of the status desired by the clergy of Saint Dié in the eighteenth century, but there is no doubt the work is incongruous if compared with what was executed during the Mediæval Ages. If, however, those innovations are overlooked and are entitled to be preserved, then it must follow that an infinite number of cases in which the novelty was less remarkable, but which have been removed, testify that destruction as much as restoration was aimed at by the officers of the Historic Monuments Commission.

There are many instances where the casting out of valuable work because it was too old or not old enough are more flagrant than those relating to Saint Dié. Unity, or rather the desire to insure an ostensible synchronism in all parts of a building, is dearly bought when it becomes necessary to sell by auction the grilles which formerly guarded the entrance to the cathedral at Troyes. The cloisters, which were erected in the eighteenth century as part of the cathedral of Sens, are now placed round the lawn in the bishop's palace. ANATOLE FRANCE records that he found in a gateway at Bordeaux two large figures, one of the eleventh century and the other of the thirteenth, which were taken away in the restoration of a cloister of the twelfth century because they were not exactly in the style of that period, and two modern imitations of twelfth-century work were substituted for them. The sacrifice in this instance was for the sake of an abstraction, and was not likely to compensate the trouble taken. French architects are too apt to forget what was said by ADOLPHE DIDRON:—"In dealing with ancient monuments it is better to consolidate than repair, better to repair than restore, better to restore than embellish, but in no case should we add or diminish."

In restorations advanced ideas of ritual and considerations of utility should, however, be recognised to some extent. The present has its rights over an inheritance. Gallicism has been superseded, and few survivals of a spirit that was once powerful in ecclesiasticism can now be met with in France. Finding a bishop's chair in a place where an altar would be expected was enough to excite surprise, and we doubt if the most zealous anti-restorer would be eager to see a continuance of the arrangement which was introduced in the cathedral of Saint Dié, still less would he desire to see it imitated elsewhere. For the sake of uniformity of ritual, which is of great importance in church affairs, the baldachin was no more than a slight sacrifice to modern ideas, and when anything has served its purpose it is hardly worth preserving in a prominent place, thus making an idol of the work of human hands. But there are other removals which were not dictated by expediency and do not increase the utility of the cathedral. The building will not in consequence hold larger congregations or induce a more reverential spirit among them. All that has been done was contemplated with the intention of insuring more general unity, which is the idol of French officialdom. The latest victim is the cathedral of Saint Dié, but, as M. CARL apprehends, the work will continue in other cities until all that has survived of ancient French art will have disappeared, and only maladroitness substitutes will remain to

delight the future spectator. That the new imitations will succumb in turn is no consolation for the loss of ancient remains.

## ARTISANS' DWELLINGS FROM THE PRIVATE POINT OF VIEW.\*

WHEN the committee of the Architectural Association did me the honour of asking me to read a short paper on this subject, I had some diffidence in accepting the invitation on account of my very limited experience and knowledge of the matter, and also because most of the ground has been so recently covered by our good friend Mr. Blashill in his most admirable and exhaustive paper on "Working Class Dwellings in Blocks," read before this Association only two sessions ago, and the series of papers on the same subject read by Mr. Owen Fleming and others a few weeks afterwards at a meeting of the Royal Institute of British Architects in this room.

My plea of knowing so little about it was met by the reply that others knew less, and I was prevailed upon to undertake the task by the assurance that some of the members knew nothing about it. It is, therefore, to those members that I must chiefly address my remarks, while craving the indulgence of those who are better informed.

As most of you will probably have to carry out artisans' dwellings for private clients before doing so for public bodies, it may be useful to consider the subject from the private point of view. In planning buildings, we all know that among the chief difficulties are the restrictions of the sites, and it seems to me that the question of sites is one of the principal differences between the subjects of the two papers presented to-night.

Whereas the sites for municipal artisans' dwellings are usually planned as part of a large scheme, with wide streets and open spaces, the sites for buildings of this class erected by private individuals are frequently plots of ground hemmed in by buildings on two or three sides, and with comparatively narrow streets in front. The private client naturally wishes to use the site—for which the rent is probably heavy—to its utmost limits, and the problem for the architect is generally to get the largest possible amount of accommodation that the site will allow (for, of course, the smallest possible amount of outlay), rather than the best type of building which, though economical of itself, may waste any portion of the available site.

Consequently, what would be considered the standard minimum sizes for rooms in municipal artisans' dwellings would not be adhered to in the case of private buildings of the same class, but a lower or smaller standard would be considered sufficient, varying, of course, according to the limits and restrictions of the site.

Practically, it amounts to this: one has to take the plan of the site and consider what is the largest cubic space on it that can possibly be occupied by buildings, having due regard to questions of light and air, and the various sections of the Building Act or regulations, such as the height of the building and width of street, the angle of  $63\frac{1}{2}$  degrees, and the open space in the rear, and the numerous other points affecting workmen's dwellings.

If the street be narrow, it may be possible to plan a larger, because higher, building by setting back, provided that the site be deep enough.

If the site be very deep it may be possible to erect parallel blocks; but there are many difficulties and restrictions with regard to this which cannot very well be gone into in this paper.

It may be well to consider the evolution of the artisans' "dwelling," as it is called, from the simple cottage, or row of cottages. I need hardly describe the latter in detail, as all of you are, no doubt, quite familiar with them. It is evident that, where space is limited, as in large towns, one can get more dwellings on a site by building them one above another than side by side, and the first step in this direction is the type of building which we may call the cottage flat. The simplest example of this type is perhaps the two-storey building, as shown on the plans of those erected on an estate in North London.

Each division between the party-walls contains two separate self-contained tenements—practically a complete cottage on each floor—each with its own approach from the street and front door, and its own yard and small garden behind. The ground-floor tenement contains an entrance passage, front room 12 feet 6 inches by 12 feet, with bay-window, back room 12 feet 6 inches by 11 feet, coal place under the staircase leading to the upper tenement, kitchen or living room, 11 feet 3 inches square, food store with a small window, scullery with a sink and copper, and a water-closet. The upper tenement, with its back and front staircases, contains the same accommodation, with an additional small room over the two front entrances. The average total cost of these buildings was about

\* A paper by Mr. Louis Ambler, read before the Architectural Association on Friday evening, May 9.

each couple of dwellings. The ground-floor tenement for 8s. per week and that on the first floor for 9s., the owner paying the rates, &c. The rate of interest on the total outlay is about 6 per cent.

I may here remark that buildings of this class should always be directed by contract if they are intended to pay. In the case of the first block or group were put up by contract for less than the amount of my estimate of 400% for each double tenement, calculated at 5d. per cubic foot, and any client thought he would get them better built without a contract he was persuaded by a relation, who owns a large amount of cottage property, to employ a clerk of works and have the buildings put up without contract, but according to the specification, the clerk of works buying the materials and employing the labour. The result was that the cost was 450% for a couple of dwellings, and the experiment of building by contract method was abandoned. Evidently the clerk of works did not buy materials so cheaply as a builder, nor get as much work out of the workmen, who would do more for a shilling, knowing that he had taken the risk of a contract, than he would for a clerk of works who simply paid them by the hour and took no risk.

The "clerk of works and no contract" system may be all right well for a house which the owner is building for himself, where he can perhaps supply part of the materials off his own estate. Then his only object is to have the best work—more or less regardless of cost; but in the case of artisans' dwellings to be built to pay it is a very different matter, and I believe that the contract system is the only feasible method of doing such work for private individuals.

A further development of the cottage-flat type of dwelling can be seen in the plans of those in Lisson Grove, where each tenement occupies two storeys instead of one, each having its own gate and entrance from the street, and each its own portion of the yard space in the rear.

The lower tenement occupying the basement and ground floor comprises a five-roomed dwelling, having also a scullery with a sink and copper, a storeroom, coal place and water-closet, two of the rooms being 12 feet square, two 11 feet 6 inches by 10 feet 6 inches, and one 8 feet 3 inches square. The upper tenement occupies the first and second floors, and is reached by an enclosed staircase from the front street door, and has an outside open air staircase down to the yard at the rear. The accommodation is similar to that of the lower tenement, but the rooms on the top floor are rather larger, and the walls being thinner, and there is one additional bedroom over a portion of the staircase, &c.

The cost of these buildings was at the rate of 6½d. per cubic foot or an average of 60% per room, sculleries and other offices, being thrown in.

The lower tenement is let for 11s. a week, and the upper for 13s., this being at an average of about 2s. 2d. per room, inclusive of rates and taxes. The buildings pay at the rate of 6 per cent. on the total outlay.

It should be mentioned in respect of the cost per cubic foot of these buildings that an exceptionally low tender was obtained, also that owing to older buildings existing on both sides of the site there were no party walls at each end to build, added to which there were no breaks or projections whatever, either at the front or rear, for the projecting windows shown in the front elevation were not allowed by the County Council.

We now come to the third type of artisans' dwellings, that is, the block of tenements having a common staircase. As staircases, landings and passages are not directly rent-producing, they must necessarily be reduced to a minimum, and the larger number of rooms approached by one staircase, the more economical is the arrangement, provided that space be not wasted in passages. The other most important point in the arrangement, with regard to economy, is that the building should be as possible a simple parallelogram, two rooms deep, and without any breaks or projections either back or front, as these involve thick walls all round, and add considerably to the cost. The two points are illustrated in the drawings of the dwellings in Southwark. The site was rather deep, but the front was in front very narrow, so that it was necessary to set back the building from the centre of the street, and to build the single block as deep as possible, in order to obtain the largest amount of accommodation that the site would allow.

For economy of staircase and passage space, the front entrance was planned at the level of the half-pace landing, and it will be seen that by this arrangement no space is wasted on the ground floor.

On the other hand, the third room built out at the back is comparatively expensive, as it has thick walls all round. A more economical block of buildings could have been planned for the site, with only two staircases instead of three, but this would have meant the loss of six rooms on each floor, twenty-four rooms in all, and the large ground rent did not warrant the curtailment of accommodation, involving also the loss of a large space behind as well as the large area that had to be built up in front.

The dwellings are planned as tenements of three rooms, except three of two rooms on the ground floor, but they are so arranged that they can be let as separate tenements of one room, or any number up to six, the front room being the single tenement, the two back rooms the double-roomed tenement, and so on.

The front and middle rooms are each 12 feet by 10 feet 6 inches, the back room 10 feet 6 inches by 7 feet 6 inches.

The middle rooms are fitted with hob-grates, so that a small amount of cooking may be done in the case of this and the back room being let together, this room then becoming the living room (as well as bedroom possibly).

No sculleries are provided, but a sink was arranged on each landing, out of the way of the traffic. These sinks, however, were omitted in execution, and only the water-supply, with draw-off taps on each landing, remained.

One washhouse, with two coppers and washing-troughs, is provided for each block containing twenty-three rooms, and the tenants use the washhouse in common, the days and times of such use being arranged by the resident superintendent, the general practice being that the tenants of each floor use the washhouse on the same day, thus making the four middle days of the week suffice for that purpose. The washhouses are locked up from Friday night until Tuesday morning, and only opened occasionally on a Monday to oblige a tenant for some special reason.

The yards in the rear afford ample drying space.

In these buildings no food stores were provided, owing to the very limited space; but I believe that cupboards for this purpose, with coal-bunkers underneath, have since been fixed in the recesses between the chimney-breasts and the outside walls in the living-rooms.

It will be seen from the elevations that hardly any attempt was made to give any architectural character to the design beyond a little variety of colour and texture, as the object was to obtain the largest amount of accommodation for the smallest outlay, and to provide only a decent-looking but perfectly plain exterior.

These dwellings cost 8½d. per cubic foot, or 69% 10s. per room, but they were built in 1898, when building prices were at record heights. The rooms are let at average rentals of 3s. per week, including rates and taxes. The buildings pay 4 per cent. on the total outlay.

All buildings for the artisan classes should be as fire-resisting as possible, and the construction should be solid throughout, with no hollow spaces for dirt and vermin to collect.

The floors should be of cement breeze concrete, with the boarding nailed directly on to the concrete, the boards of the lowest floor being tarred underneath.

I have found 1 part of Portland cement to 6 parts of clean, sifted gas breeze suitable for floors, and the same in the proportion of 1 to 5 for staircases and landings; the floors 6 inches thick being finished with a floated face in cement and fine sifted breeze to receive the wood flooring, and, where not boarded, finished with 1 inch thick smooth Portland cement floated bed.

The concrete of the upper floors and landings has ½ inch solid square wrought-iron rods embedded therein, 1 foot apart, 2 inches above the underside of the floors, the rods being in as long lengths as possible, and laid on fir beams, usually about 9 inches by 6 inches, fixed about 4 feet apart, and notched at the top to form a key for the concrete floors, chases at least 1 inch deep being left in the walls for the same purpose. These floors are much less expensive than the usual steel or iron joist and concrete fireproof floors.

All window and door frames and linings should be bedded solid, and casements are preferable to sashes, on account of the hollow spaces in the sash-frames.

Casements are, however, frequently broken off their hinges, or the hanging styles are often broken, by being flung open too violently, but sash lines and beads suffer similarly, so there is not much to choose between them on that score.

Skirtings should all be of cement, and no woodwork should be used where it can reasonably be avoided. Staircase balustrades and handrails should be of iron. If of wood they are frequently used for firewood.

Ranges and coppers should be portable, so that they can easily be taken out and replaced when necessary. Service water pipes should be of iron, as far as possible, not lead.

Granite plaster, laid in two coats, is much harder than ordinary lime plaster in three coats, and costs very little more.

I think the best finish for plaster walls in these buildings is washable distemper, the staircases and landings having high painted dadoes. Some people prefer the living rooms papered; the tenants certainly do.

For all external painting I like ivy-leaf green, and for internal woodwork, the most economical and serviceable treatment is staining, say American walnut colour, and varnishing.

Sanitary fittings should be of the plainest, simplest, and strongest quality, and lead waste pipes and soil-pipe connections

should be avoided. The former should be of earthenware, and the latter of galvanised cast-iron, made to the required length and angle.

Cross ventilation is essential in all parts of the building, by means of windows and doors, not ventilators or air-bricks, which the tenants stop up if they can get at them. Ventilating air-bricks are, however, desirable close to the ceilings of the water-closets, and where the top landing window of a staircase is much lower than the ceiling, a ventilating-shaft from the highest level of the ceiling may be an advantage.

Open-air staircases are now almost universally condemned, and I think them objectionable, as a rule.

Dust shoots are most undesirable, in my opinion, and the pail or dust-bin emptied every day meets all requirements in that respect.

As regards the broad question as to whether these buildings pay, whether they are a good investment or not, much depends on the site and its possibilities and restrictions, the value or rent of the ground, the cost of the buildings, the position and surroundings, the neighbourhood, the character and proximity of other buildings, and, above all, the wise and careful management of the property.

It is clear that private individuals who put up buildings of this class in small blocks on limited and restricted sites are at a disadvantage compared with municipal bodies and large trusts who can deal with huge blocks and vast areas.

In these large schemes there is more scope for architectural treatment than in small ones.

The varieties of groups and masses, tall gables, oriel windows, turrets, and other architectural features are rarely possible to the private builder of these dwellings, unless imbued with more than the average amount of philanthropy and the means to carry out such buildings on a large scale.

I have endeavoured in the preceding remarks to avoid repeating what has been said in recent papers on the same topic, as far as possible, but I fear that certain truisms and repetitions of many of the dicta before laid down are almost unavoidable in a paper of this nature.

I hope I may be forgiven for any trespasses committed in this respect, and it only remains for me to thank those architects who have kindly lent some of their drawings to illustrate the subject of my short discourse.

The PRESIDENT said that before discussing any points raised by the two papers he would make known the report of the scrutineers on the election of officers for the next session. The voting papers in the ballot numbered 317, but nine had been declared invalid. The results were as follows:—

#### *House List, 1902-3.*

*President:* Mr. H. T. Hare. *Vice-presidents:* Messrs. W. A. Pite and L. Ambler. *Committee:* Messrs. W. H. Seth-Smith, G. H. Fellowes Pryne, F. D. Clapham, G. B. Carvill, W. H. Raffles, E. Guy Dawber, R. H. Weymouth, John Murray and Hon. A. McGarel Hogg. *Hon. Treasurer:* Mr. Francis Hooper. *Hon. Librarian:* Mr. J. MacLaren Ross. *Hon. Secretaries:* Messrs. R. S. Balfour and H. P. G. Maule.

Mr. FRANCIS HOOPER moved that a vote of thanks be passed to the retiring President. He assured the meeting that he did not rise to propose a formal vote of thanks on their behalf. For two years it had been their good fortune to have as their President one who had given much valuable time in the service of the Association. So great had been his work during the period that Mr. Seth-Smith could stand shoulder to shoulder with any of the best of their past presidents. There was the day school, of which they heard very gratifying reports, and the men who joined the classes have satisfied Mr. Bolton and his assistants by the amount of enthusiasm they have shown in their work. The second scheme which Mr. Seth-Smith had placed on a firmer basis than any past president had done related to the new premises.

Mr. SETH-SMITH, in reply, said the Association was inspired by a very lofty ambition, which was nothing less than that London should be a city of beauty. Their endeavour was powerful enough to make the best architects in London willing to promote its attainment. He had caught the infection of enthusiasm, and had followed the example of many abler than himself; therefore no special credit was due to him for drinking deeply of the joy which such work brought with it. He expressed his heartfelt thanks to his colleagues of both years for their support, including their exemplary and indefatigable secretary, Mr. Driver, who by his own efforts had obtained 139*l.* for the new premises fund. In conclusion, he moved a vote of thanks to the hon. secretaries, the librarian, the editor and assistant editor of A. A. Notes, the education committee, the Technical Education Board for Workshop Demonstrations, the Royal Institute of British Architects for the use of the meeting-room, to Mr. E. W. Wonnacott for working the lantern, and to others who had assisted the work of the Association in various ways.

The CHAIRMAN then opened the discussion of the two

papers. He said the problem raised in dealing with artisan dwellings was a great one, and it was looked upon by state men as being one of the foremost questions of the day which must soon receive practical attention. It seemed unavoidable that a large percentage of the 'population' should live in abject poverty. People might talk philosophically about the sacrifice of the lower to the higher type of humanity, and try to prove that the sacrifice of the very poor enabled the higher type to become more highly trained, resulting in a reaction leading to discoveries which would improve the condition of the poor. It was rather in the quiet working out of such a problem that they might hope for improvement.

Dr. SYKES, who proposed a vote of thanks to the author of the papers, said there was an undertone in Mr. Fleming's paper which showed that he felt that the attacks made on municipalities in the matter of housing had been from the point of view that they held a position financially superior to that held by the private individual, and Mr. Ambler in his paper laid great stress on the true fact that it was a difference of site values. There was a tendency in certain working-class dwellings to build piles of rooms one on top of another, and to arrange the sanitary and domestic conveniences as in an ordinary house. This was not desirable; in building such dwellings the aim should be to make homes for the working classes. It would be well to substitute the word homes for dwellings. It was important to make these dwellings as private as possible.

Mr. GUY NICHOLSON seconded the vote of thanks, which was supported by Messrs. W. J. H. LEVERTON and H. P. G. MAULE.

#### SOCIETY OF ANTIQUARIES OF SCOTLAND

AT the last meeting of the session of the Society of Antiquaries of Scotland the first communication read was notice of the excavation of a burial cairn at Greenhill, in the parish of Balmerino, Fife, by Mr. Alexander Hutcheson, F.S.A.Scot. The cairn is on the property of Mr. Henry Scrymgeour-Wedderburn, of Birkhill, and the operations were carried out at the expense of that gentleman. Several cists were laid bare, as well as several collections of cremated remains unenclosed by any cist, each collection, however, with one exception, being accompanied by an urn of food-vessel type. Seven urns in all were discovered, all however more or less broken. Several small and thin beads of bone of the same character as those found in the Horned Long Cairn at Yarrow, Caithness, were got in one of the collections of bones. A collection of about eighty jet beads of the "bugle" variety was found lying in the bare rock near the south-west side of the cairn. A skelb of flint, shaped something like a rud arrow-head, accompanied one of the collections of burned bones. The urns, with one exception, were of the common wide-mouthed variety. The exception was what I believed to be the smallest urn ever discovered. It measures less than one inch in height, and only a little more than an inch in diameter, and weighs less than half an ounce. It swells slightly below the lip, then curves inward to the base where it measures only three-quarters of an inch across, and is ornamented there with a series of notches, which are repeated round the lip with scores running diagonally between. It differs entirely in appearance and form from the class of urn known as "incense cups," which have hitherto held the field as the smallest specimens of fictile art known to Scottish archaeology, but the smallest of these has probably a dozen times the capacity of the Greenhill little urn. It was found placed alongside one of the larger urns in a pit dug in the subsoil, and covered with a weighty slab of whinstone. No other example has been recorded, and the discovery is therefore of much interest to antiquaries.

In the second paper Mr. M. M. Charleson, solicitor at Stromness, described a chambered cairn which he had excavated last summer in the parish of Firth, Orkney. The mound, which is situated on Kewing Hill, and is locally known as the Fairy Knowe, was found to be a circular chambered cairn, somewhat analogous to Maeshowe in the construction and arrangement of the chamber, which was over 11 feet in length and 5 feet in breadth, the walls beginning to converge to a beehive shaped roof at a height of about 4 feet, the highest portion now remaining being about 7 feet above the floor. Four oblong cells, also roofed on the beehive principle, branched off the four sides of the main chamber, their entrances being about 2 feet square and within a few inches of the floor, while within the cells are about 6 feet high, three of them being about 5 feet in length and the fourth 11 feet long. The entrance passage from the outside to the main chamber is 11 feet in length and little more than 2 feet square. No artificial objects were found, but in the chambers and passages were many bones, human and animal, the latter being remarkable for the large number of the skulls of dogs among them.

The third paper was by Dr. James T. Richardson and

James S. Richardson, Tighnamara, North Berwick, and gave an account of prehistoric remains and cist burials discovered there near Gullane. Flint implements and arrow-heads having been found in the sandhills between Gullane Ness and North Berwick, through the courtesy of Mr. Hamilton Ogilvy careful inspection was permitted, with the result that numerous prehistoric burials were found in various parts of that area, mostly enclosed in cists, and covered by small cairns of stones. One such cairn, about 6 feet in diameter and 1½ feet high, contained an oval cist, with rudely built sides and covered by a slab of large size. On the floor lay the remains of three adult skeletons. At its northern end, but quite outside it, beneath the sand, were four human skulls, and beneath them the skeletons to which they belonged. No artificial relics were found with these interments, but on the surface of the wind-swept hollows among the sandhills the authors had collected upwards of 100 flint implements, arrow-heads, knives and scrapers, many of them highly finished and in perfect preservation.

Mr. Alan Reid, F.S.A. Scot., contributed a description, with drawings, of the building known as the King's Cellar at Inverkilns. It is a long, narrow erection, built of undressed stones, two storeys in height, the upper storey being now reached by an outside stair of modern construction. The door windows are of last century date, having been made when the vault was converted into a school. This upper room is sidily floored on the arched roof of the cellar beneath, and has a pane pointed ceiling, the arch of which rises from a few feet above the floor to a height of about 18 feet. The lower storey had been entered by a couple of arched openings in the front, which are now built up, and the original access to the upper floor had been by an outside stair leading to a pointed doorway in the eastern gable, now also built up. At the north-east corner are the remains of a corbelled round tower, which contained a stair, and was evidently higher than the wall. Over the modern door is inserted a slab with a finely sculptured shield of arms and the date 1581, but it does not belong to the building. The arms are quartered, Pitcairne and Murray, and are probably those of Commandator Robert Pitcairne and his wife, Eufame Murray, of Tullibardine.

Mr. Angus Grant, Drumnadrochit, gave notices of two ancient sepulchral slabs, with Calvary crosses of the early Celtic period, at Kilianan and Kilmore, and a fine sepulchral slab, carved in relief, also at Kilmore, Glenurquhart, Inverness-shire. A notice of the hoard of coins of the Edwards recently discovered in ploughing at Kinghornie, near Bervie, was given by Mr. George Macdonald, curator of coins, and a notice of the coins and their contents at Cairnhill and Doune by Dr. Joseph Alston.

## ARCHITECTS AND CHURCH BUILDING.

THE annual court of the Incorporated Church Building Society was held on the 15th inst. under the presidency of the Bishop of London.

The Bishop of Southwell, in moving the adoption of the report, said it was a great part of the work of the Society to improve the nature of the buildings which were erected, so that they might really be churches, and not be buildings which rather hindered than promoted the elevation of spirit of the people who came to worship in them. He felt convinced that the people who lived for more than half a century grew in reverence even with regard to their personal treatment of church buildings. He did not think that the Society could yet do without some architectural advisers. The choice of an architect for the building of a church was sometimes decided by mixed motives. He observed that the architects themselves had been starting the notion that there ought to be a college of architects for the elevation of architecture, the queen of arts. There ought to be some kind of collective court of judgment which would make known, and in that way become a feature of the nation. The conventional pictures of John Bull, which we accepted and naturally as representing ourselves, were very much those which represented material self-satisfaction, and were governed with a general sense that every man ought to do his duty, rather than they were those which represented any kind of spiritual or intellectual refinement or care for things which might seem somewhat sublimated. He thought that English people needed a great deal of instruction with regard to church architecture. In such church architecture there ought to be, not simply scientific and engineering truth, but artistic beauty. English people in general very much required to be taught that fact. In all the churches which he had had the pleasure of inspecting and opening, that which had pleased him most on the ground of artistic skill was one which Mr. Caröe had built for a comparatively very small price, and he had endeavoured to put that church before his people as a model which they ought to adopt and follow. He would recommend that this Society should adopt the much-abused expedient of

advertising a little more. He did not advocate a "black list," but he thought that the Society ought to advertise the prominent merits of those artists who could really do the work which was wanted.

Mr. W. D. Caröe, M.A., F.S.A., seconded the motion. He felt that thanks were due to the compilers of the report for the lucidity with which the affairs of the Society were stated in it. He had been asked to say a few words from an architect's point of view. He had had great pleasure in listening to the admirable remarks which the Bishop of Southwell had made on the architectural side of the question. They had had a year and a half's work of the Society's new instructions to architects, and an opportunity had been afforded of gauging their efficiency and usefulness. The condition of church building and architectural practice had largely changed with the recent rapid growth of provincial and country towns, but when the old rules were framed church work was mainly confined to a limited number of architects very much of one school. The number of architects had multiplied out of all proportion to the increase of church building, and it followed that a large quantity of church work was now done by men who, from the very nature of the case, had had comparatively little practice in it, and who had had very little training to fit them for that class of work. Circumstances had conducted to a low average level in the work produced. There ought to be something of a monumental character in the architecture of a building devoted to the service of God, and the gift of monumental creation belonged only to the few. The new rules of the Society, or new instructions to architects, had been found to be required in consequence of the change which had arisen in architectural practice through provincial towns desiring to employ their local architects. But no rules would improve architectural taste. The improvement must come from the clergy and the people. The rules were not intended to stereotype architecture and to induce architects to constantly repeat themselves, without reference to locality or fitness. Fine architecture was not necessarily expensive. Elaboration was expensive, but elaboration was not an essential of fine architecture. No work was cheap which needed constant repair. The cost per head of churches was a misleading calculation. If a church was built to seat 700 persons, it could, in his opinion, be built for 10*l.* a sitting if a western gallery formed part of the structure. Churches with an appreciably smaller number of sittings than 700 could not be built at 10*l.* a sitting. With regard to the preservation of ancient buildings, he hoped that the clergy would give the matter fuller attention as a scientific study. The new rules of the Society contained some special reference to the subject. The Bishop of Rochester had made an attempt to improve the standard of taste in church fittings. He (Mr. Caröe) hoped that the improvement might extend to the taste displayed in church windows which were added to churches after they had passed beyond the control of the Society.

## SHAFTESBURY ABBEY.

ON Saturday Lord Stalbridge presided at a meeting at Shaftesbury to consider excavations it is proposed to carry out at Shaftesbury Abbey. It was stated that in July 1861 a partial excavation of the site was made by Mr. Batten, agent to the Marquis of Winchester. When the foundations of the choir and the apsidal chapels on either side, as well as those of the crypt, were brought to light many objects of interest were found, including a gold hoop ring set with emeralds, a chalice, and a number of heraldic floor tiles and portions of sculptured monuments. A small portion of the abbey, barely a quarter, was disclosed, and it is now proposed to carry out a thorough excavation of the whole site. The Corporation of Shaftesbury have contributed 50*l.* towards the cost of the work. The work will be conducted under the supervision of Mr. Doran Webb, F.S.A., president of the Wilts Archaeological Society. Amongst those who have consented to act on the committee are Lord Stalbridge (chairman), Viscount Dillon, president of the Society of Antiquaries; Mr. H. P. Blackmore, president of the Salisbury and South Wilts Museum; Mr. C. H. Read, keeper of British and Mediæval Antiquities, British Museum; Mr. S. Shaw Stewart, the mayor of Shaftesbury; Mr. A. T. Carpenter, Mr. H. C. Forrester (treasurer) and Mr. J. Bennett-Stanford (hon. secretary). It was decided to begin the excavation on June 9, when Lord Stalbridge will turn the first sod.

A Concert is to be held at Wyndham's Theatre on May 30, under the organisation of Lady Londesborough, to assist the fund which is being raised to pay off the debt on the fine Norman church at Thwing.

## NOTES AND COMMENTS.

It is proposed to hold an exhibition of Early Flemish art in Bruges from June to September of this year. There is an English committee, with Lord BALCARRES, M.P., as chairman, and already promises of loans of forty-five pictures have been obtained. Among the contributors are the Corporations of Liverpool and Glasgow, Lord NORTHBROOK, Lady WANTAGE, Sir FREDERICK COOK and Mr. GEORGE SALTING. It is needless to say the public galleries of Belgium, churches and convents, will furnish works. It has also been arranged to obtain pictures from The Hague and Amsterdam, and without doubt from other Continental cities. The paintings will be placed in the Government buildings on the Grande Place of Bruges, while goldsmiths' work, ivories, sculpture, manuscripts, miniatures, lace, &c., will be shown in the Hôtel Grunthuse. It is well known that HUBERT and JOHN VAN EYCK resided in Bruges as well as in Ghent, and they are reputed to have been the inventors or improvers of oil-painting. Their principal work, *The Adoration of the Lamb*, which dates from 1432, is not likely to be in the exhibition, but it is no great distance to Ghent, where the two central divisions of the picture are found. The reliquary of St. URSULA, painted in gratitude by HANS MEMLINE, and which is a perennial source of income to St. John's Hospital, Bruges, is also likely to be withheld, but nobody will hesitate to pay a few pence to see so renowned a gem. The English National Gallery contains several examples of early Flemish painting, but they are not as much appreciated as they merit.

A COUPLE of months since an American General named SOOYSMITH, in an after-dinner oration, endeavoured to startle the other guests by becoming prophetic about the dangers of steel in the construction of buildings. The words served journalists as a text for a few alarmist articles, but investors were indifferent, and the erection of lofty buildings and steel structures continues to be carried on without cessation. The steel structure is a necessity in American cities, although it may not be as yet required in Europe. The brave General could only speculate, but the architects and engineers who have been connected with that class of building from its initiation have satisfactory evidence that the danger does not call for special attention. Every kind of material employed in building is liable to decay owing mainly to the agency of the atmosphere. But when parts of a building are withdrawn from that action, and are, in fact, carefully concealed, their decay becomes diminished instead of being increased. Inquiries have been made of several architects, and they have related their experience. The representative of one firm said:—"A short time ago we made an examination of the steelwork in the Tacoma and Pontiac buildings, erected a number of years ago, for the purpose of investigating this point. We found the steel absolutely unimpaired, and as this is in line with the result of similar investigations made by others, I think there is every reason for believing that corrosion is so distant a menace as to be undeserving of consideration." Another said:—"We have taken out and examined steel that has been in a building twenty-four years, and we found it as good as new and put it back again. So far as our experience has gone we have failed to discover that corrosion is a menace to the modern steel-constructed building."

In their report for 1901 the committee of the Incorporated Church Building Society mention that the committee of honorary consulting architects, to whom the Society is so greatly indebted for examining and reporting upon the plans submitted to them at their monthly meetings, have lost during the past year through death their chairman, Mr. JAMES BROOKS, who for so many years was such a staunch and valued member of their body. A special resolution of sympathy has been sent to his relatives, and the vacancy on this committee thus created has been filled by the election of Mr. TEMPLE MOORE, whilst Mr. J. P. SEDDON, whose long and valuable services the Society gratefully recognise, has been appointed chairman of this committee. The members are at present Messrs. BODLEY, R.A., CARÖE, FAWCETT, FERGUSON, HODGSON FOWLER, INGELOW, MICKLETHWAITE, MILEHAM, MOORE, PRYNNE, OLDRID

SCOTT, SEDDON, NORMAN SHAW, R.A., and ASTON WEBB, R.A. During the past year the sum of 5,242*l.* has been granted. Since the Society was established in 1818 it has aided the building of churches to the extent of 895,68*l.* It has therefore been instrumental in co-operating in the erection of no less than 2,365 additional new churches, and in assisting in rebuilding, enlarging, or otherwise improving the accommodation in 6,235 other churches or consecrated chapels of ease. By these means more than two million additional seats have been secured, by far the greater part of which are for the free use of the parishioners according to law. The additional expenditure on the part of the public has amounted to 15,281,887*l.*

In his last report Lord CROMER, when describing the work done in the Egyptian Archaeological Department, said that "at Karnak the whole of the fallen columns have been removed and the foundations levelled and cleared. An experiment on a small scale is to be tried in the course of this year by rebuilding some of these columns upon new and better foundation." His lordship is prone to minimise the work he has inspired in Egypt. The labour that was needed to bring some order into the chaos which was the consequence of the collapse of eleven of the great columns in October, 1899, cannot be realised from the few words to be found in the report. It was decided to collect all the fragments as if they were precious, and to deposit them temporarily in an improvised hall. One of the columns consisted of thirteen drums besides the capital; the total weight being over 140 tons. There were, however, nineteen capitals and nearly 500 drums which had to be gathered. An attempt was made to place the drums in order as well as could be ascertained, similar to what was done in one of the Pompeian temples. The architraves were so shattered it was impossible to dispose of them in an orderly way, but all has been accomplished which an anxious desire for preservation could suggest. The temple and the repository have been enclosed, and a visitor is no longer at the mercy of beggars and vagrants. We cannot see the ruins as they appeared prior to 1899, but owing to the care taken by M. MASPERO and his officials, what has survived will be less liable to accidents than formerly.

DESIGN FOR QUEEN VICTORIA MEMORIAL.

BENEDICTINE MONASTERY, FARNBOROUGH, HANTS.

THESE buildings are to be erected on the south side of the priory church of St. Michael, which contains the tombs of His Imperial Majesty NAPOLEON III. and His Imperial Highness the PRINCE IMPERIAL. The building forms a quadrangle about 180 feet in length each way. On the south side of the cloister the ground floor is occupied by the refectory offices and principal staircase. The west front contains the entrance hall, guest parlours, &c., and the north side the library, &c. The two upper floors contain the cells for the monks. Between this building and the church the chapter-room and bell tower will be erected. The style is an adaptation of Early Gothic architecture, chiefly suggested by the magnificent abbey erected by Dom MELLET, O.S.B., at Solesmes, one of the most remarkable and original buildings erected in modern times. Externally it will be faced with Kentish rag stone with capitals and bases of columns in Portland stone, the columns themselves being mostly black Connemara marble.

The section now in course of erection includes the south-west tower, principal staircase, entrance hall and parlours, with cells in the upper storeys. The contract was 4,252*l.*, and the contractors Messrs. G. GODSON & SONS. Mr. BENEDICT WILLIAMSON is the architect.

DESIGN FOR PUBLIC BATHS AND LIBRARY, YORK ROAD, LEEDS.

# PEOPLE'S BATHS.\*

title of the subject of this paper is one that is seldom, ever, heard of in connection with bathing establishments in this country. Here our public bathing establishments are public baths. Before America, so far as the United States was concerned, commenced to build public baths, men were sent to inspect the baths throughout bathing. After much time and money had been expended in knowledge, the New York Association for Improving the Condition of the Poor decided to build a bath on the spray shower system. This they did; the baths were erected in Market Place, and were named the People's Baths. This appears to be the first occasion on which the "People's Baths" was used. It is now generally known to public baths which are provided with the spray and bath, but having no swimming-bath.

The subject is one worthy of the consideration of architects. We all know that public bodies representing the health authorities throughout the kingdom are at present keenly interested in anything which is conducive to the health and of the people.

The spread of education is being felt; what sufficed for our fathers will not do for us; we want better food, better clothes, better houses; we want cleanly bodies, and if we have no means of getting the latter in our homes, we want public institutions where we can bathe. A few years ago only large cities and towns had their public baths, now we find small towns with public bathing establishments. In the course of time every parish council will require and must have its public bathing establishment.

It cannot be expected that a small parish can afford to have public baths at a cost of 10,000*l.* or 20,000*l.*—if they did where would the utility be? What they want is an installation of public baths costing a sum of money so small that places of bathing institutions within the reach of all such bodies. Again, in cities and towns already provided with bathing establishments, the judicious introduction of people's baths will supplement the existing baths and be a means of taking the bath to the people. It is more than probable that the next ten years will see a very rapid development of the public baths throughout the kingdom. The subject is therefore one of consideration.

When I became a member of the baths committee of the Liverpool Corporation I have devoted considerable time to the subject we are about to deal with. I am of opinion that the most suitable bath for the purpose of cleansing the working classes is the spray and shower bath, and I am pleased to say that I have, together with the other members of the committee, been instrumental in introducing this type of bath to the city of Liverpool.

It is not the intention within the limits of this paper to enter into the question of design, every architect is entitled to his own opinion on such a matter, but to deal with the principles and details of construction, together with the engineering of people's baths.

Before entering into the foregoing questions it may be well to go back to the history and development of the shower and spray bath. It appears that it originated in Germany. The first establishment to attract attention was erected in the barracks of the Kaiser Franz grenadier regiment of the guard in Berlin, in 1878, at the instance of Dr. Munich, a military surgeon. The bath was for the use of officers and men. It cost 100*l.*, and was capable of bathing 300 men per hour. The bath was planned by Mr. David Grove, sanitary engineer, Berlin.

In the year 1883, at the Exposition of Hygiene in Berlin, Dr. Lassar exhibited a people's bath house. It was constructed of corrugated iron without any architectural pretensions. It measured 36 feet 1 inch long by 16 feet 5 inches wide and cost 300*l.* It contained ten shower-bath cabins, each having a dressing-room; the usual ticket offices, separate ticket office for males and females, and administrative department. During the three months that the exposition lasted no less than 100,000 persons made use of this bath. After the exhibition it was purchased by a manufacturer for the use of his workpeople. The Berlin Society for People's Baths exhibited at the Berlin International Exhibition of 1896 a model of an establishment of people's baths, plans of which may be seen on the wall. The establishment provided accommodation for ten persons, having two baths for each sex. This model was awarded a prize of 100 marks (50*l.*) for the best plan or model of a workmen's

people's baths of the foregoing (Lassar-Grove) type have been constructed in many German cities. In Austria, Vienna was the first city to establish these baths; the first was erected in 1877 and was purely experimental. So great was the success of this bath that additional baths were built, and to-day Vienna

has a number of people's baths. In America people's baths have been erected in the following cities:—New York, Yonkers, Buffalo, Dunkirk, Boston, Brooklyn (Mass.), Philadelphia, Chicago, Newark and many other cities.

In England, however, no complete installation of people's baths has to my knowledge been erected, although several instances occur where the shower and spray bath has been introduced into existing and new public baths, viz. Norwich, Cheltenham, Liverpool. Some years ago Manchester introduced what they termed "tub baths" into one of their establishments which was situated in one of the poorest districts. These baths consisted of a shallow circular tub having an internal diameter of 2 feet 5½ inches and a depth of 9½ inches; they were raised above the floor and were provided with hot water, and included a warm shower bath. Besides these tub baths a range of lavatory basins were fixed. After twelve months' trial it was found that the tub baths and lavatories were failures. It appears that the district in which these baths were situated was chiefly populated by Jews; this would to some extent account for the non-success of the baths. The general experience of the bathing of Jews is that they more than any other sect prefer the use of the slipper bath, and with the water at a much higher temperature than is required by ordinary bathers; they (to use the words of the general superintendent of the Manchester baths) prefer to have a soak as well as a wash, and refused to use the tub bath on any account.

## Norwich.

The Norwich baths when erected were called Stand-up Baths; details of one of the cubicles are shown on the wall. The bath comprises a cold shower, a lavatory basin with hot and cold water, and a footbath sunk in the floor. The arrangement of the supply to the foot-bath is rather novel, the water being supplied through the lavatory basin; that is, the lavatory basin waste is connected to the footbath. The idea is not at all a bad one; a set of valves and one waste pipe serve the two purposes. The waste plug to the footbath is actuated by means of a treadle lever worked by the foot. These baths have been very successful.

## Cheltenham.

The borough of Cheltenham added six spray baths to their Alstone Baths in 1897; plans of the same are shown on the wall. They were designed by the borough surveyor, Mr. Joseph Hall. The dressing-rooms and spray-rooms are formed in cubicles, each bath-room has two dressing-rooms, the spray-room cubicle has the top covered with glass, having a ventilating sash in it, which can be opened or closed as the bather may desire. The idea is good; the glass roof prevents draughts on the bather; it also raises the temperature of the spray-room. The footbaths are raised above the floor of the room to the level of the underside of the seat, a seat being formed on the back and two ends of the bath; the seat slopes to the bath. The bath is an oblong bath, 2 feet by 1 foot 6 inches, enamelled fireclay. The spray bath consists of four fine rose nozzles, two at the back and one at each side, fixed at such a height that the water strikes the bather no higher than the shoulder whilst in a sitting position; the bather controls the temperature of the water by means of screw-down valves; it appeared that there was some danger of scalding taking place. The ventilation of the bath is on the Plenum system. These baths have proved a huge success.

## Bristol Baths.

The drawings exhibited on the walls include the drawings of the spray baths at present being erected for the Corporation of Bristol. These baths are constructed on Kane's system. The chief feature of this system is that the dressing-rooms and the bath-rooms are kept at different temperatures. Mr. Kane states that "the absence of a modern and efficient system of heating and ventilating our cleansing baths means the absence of warmth and comfort," and if the habit of bathing is to be encouraged, especially among the poorer class where it is more required, then the better construction of bath compartments is a factor which cannot be neglected in future schemes. The plans of Kane's baths illustrate a method of constructing bath compartments so that the bath-room is separated from the dressing-room. Mr. Kane also states that he is altogether in favour of suitably designed spray baths, but believes it to be absolutely essential that the bathing compartment, both as a means of more thoroughly cleansing the body and as a preventive of chills to the bather, ought to be maintained at 100° Fahrenheit, and the dressing-room 60° Fahrenheit. On examining the drawings of these spray baths for Bristol, one cannot help admiring the Bristol Corporation for getting what they consider to be the best, irrespective of the cost. It will be observed that the floor space per bath together with the dressing-room and corridors is 70 feet super, whilst the cubical contents per bath is nearly 1,700 feet. It is a question whether the extra cost entailed in erecting these baths will be warranted by the additional number of persons who may make use of them, and it will be exceedingly interesting to see the result.

\*A paper read before the Society of Architects on May 22 by Walter W. Thomas, vice-president S.A., deputy-chairman of the Liverpool Corporation baths committee.

*Liverpool.*

The Corporation of Liverpool, in the year 1892, constructed several shower and spray baths at their Charters Street refuse destructor for the use of the workmen employed at the destructor. These baths have been very much appreciated by the men, and it goes to show that at works of this description, *i.e.* any works where the nature of the employment is of a dirty character, baths ought to be provided by the proprietor of the works to enable the workers to leave the premises in a condition fit to associate with their families. In 1900 the Corporation fitted up at their Margaret Street baths three spray and shower baths in order to carry out experiments before proceeding to construct an establishment of people's baths. The experiments were continued for over twelve months, and the experience gained has been utilised in the designing of their Beacon Street People's Baths.

*Beacon Street Baths.*

The Corporation have just erected in one of the poorest districts in the city a complete installation of people's baths. The district in which these baths have been erected is in close proximity to the docks, and the establishment it is hoped will be largely used by men who are employed at the docks, and by the families of those who reside in the vicinity. The establishment stands on an area of 450 square yards and cost 3,500*l.* It comprises seventeen shower and spray baths and four ordinary slipper baths. The baths are all situate on the ground floor; there are separate entrances for males and females, also waiting-rooms, lavatories and conveniences. The baths are arranged in sections so that they may be used for males and females according to the demands of either sex. A caretaker's house and laundry is also provided, together with the engineering department.

From the drawings exhibited on the wall it will be seen that the two entrances are at the extreme sides of the building, whilst the pay office and attendants' hall is situate in the centre of the building. Doors lead from the pay office and attendants' hall into both waiting-rooms, and also into the caretaker's living-room and into the laundry. It may appear to many of you that the laundry ought not to be placed in the position it occupies, and that it ought to have been situate outside the baths building, or at least as far away from its present position as possible. The reason of it being where it is is of considerable consequence in the working of the establishment. It is the intention that the staff of the establishment shall consist of a caretaker and his wife, with the assistance of a youth. These three persons will do all the work in connection with the establishment, from the issuing of tickets, attending bathers, stoking the boiler, to the washing of towels, &c. It will thus be seen that it was absolutely necessary that the pay office should be under observation from every room in the house, and also from the laundry, so that, however they might happen to be occupied, the attendants would command the pay office and baths.

The first floor comprises two bedrooms, cold-water tank-room and store-room. In the basement are the stokehole and steam boiler, and a heating cellar, in which is placed the apparatus for heating the water, &c.

The baths halls are top-lighted, and are heated by steam radiators and steam pipes in the roof. The baths are formed in cubicles; the division walls of the bath and dressing-room are built in Shepwood enamelled bricks, with rounded angles and semicircular ends; there are no door frames or doors, so there is nothing to decay. It is the intention, instead of having doors, to provide rubber curtains between the bath and dressing-room, and some washable material between the dressing-room and corridor. The dressing-rooms to shower and spray baths average from 3 feet 9 inches by 3 feet 3 inches to 4 feet 10 inches by 3 feet 9 inches, and the bath-rooms 3 feet 9 inches by 3 feet 3 inches to 3 feet 9 inches by 4 feet. Each dressing-room is provided with hat and coat hooks (these are made of galvanised cast-iron, and are built in the brickwork), and wood seat; the floor of the dressing-room is granolithic, and is sloped to the bath-room, so that it drains into the footbath; it is covered by a movable wood grating similar to those found on board ship. The spray and shower bath-rooms are provided with an enamelled footbath of special design. It is designed so that the minimum quantity of water will suffice to enable the bather to wash his feet therein; it is fixed in the floor, and the top edge is slightly below the level of the floor; it is fitted with plug and chain and overflow. The spray and shower bath are each fitted with warm and cold water; the spray mantel is fixed on the wall of the bath; the shower bath is simply a ring shower; the shower is in the form of a ring, and not of a cullender; thus the water falls in a gentle shower on to the shoulders of the bather, whilst the top of his head and his face are perfectly free from water, thereby getting over the trouble of water striking the head, thus obviating the consequences of shock to the system, and doing away with the difficulty in breathing generally experienced whilst under an ordinary shower bath.

The arrangement for the manipulation of the hot water is such that it deserves special mention, special and mixers having been designed for the purpose. The arrangement is shown on the photographs exhibited on the walls, and is such that when it is once set by the attendant, the bather can only obtain the warm water of the temperature desired and no warmer, thus avoiding any possible chance of being scalded, whilst he can gradually cool it down until cold. The bather controls the valves by means of pulls in number, viz. warm and cold to both the spray and shower bath, and in order that he may have his hands free to pull himself with he can fix the pulls down by means of hooks on the wall of the bath-room. The soap dish is of enamelled clay, and is built in the wall.

The slipper bath-rooms are similar to the ordinary bath-rooms found in public baths, and therefore require no explanation other than why they are provided. The reason for their provision is twofold—first, that as it is impossible for a person to wash a child in a shower or spray bath, some provision ought to be made to enable the parents to wash their children in an establishment of this kind, *i.e.* this reflects on children not old enough to bathe in our free open-air baths, which Liverpool was the first to introduce. And again, some baths are taken on the advice of medical men as a means of curing certain ailments, therefore it was deemed necessary to provide slipper baths to a small extent should be included in the scheme.

*Drying Clothing.*

Arrangements are also made for the drying of bathers' clothing during the time occupied in bathing. Thus, on any day, any person who has been out in the rain may, after bathing, have his clothing dried and thereby be able to return to his home clean in body and with dry clothing. This is an important feature, and one that ought not to be lost sight of in designing a bath of this class.

*Engineering.*

The engineering of this establishment is very simple, consisting of one Cornish boiler, 8 feet by 4 feet, to provide steam for heating water, heating atmosphere and laundry requirements, and drying bathers' clothing. One Royal calorifier and storage cylinder combined, capable of heating 1,000 gallons of water per hour, from 32 to 180 degs. Fahr. has a storage capacity of 180 gallons. The condensed steam from the calorifier and heating pipes and radiators is pumped back by means of a small donkey pump into the steam boiler. A cold-water storage tank of 1,500 gallons capacity is provided.

*Materials.*

The building is constructed in brick and stone, the walls and halls are faced with white enamelled bricks to the height of 6 feet. The divisions are built with enamelled bricks 2½ inches thick (Shepwood), the floors are granolithic, and waste water from the baths is carried away by what is almost an open channel to the outside of the building, where it passes through an interceptor into a manhole which is connected with the sewer by means of a syphon. The whole of the piping for water service is of lead, and the fittings are of copper and brass.

*Planning of People's Baths.*

The planning of people's baths depends chiefly on the shape of the site available, but as the hall and rooms required may be of any form, no unsurmountable difficulties will be experienced with any ordinary site; care, however, ought to be taken to have the arrangements as symmetrical as possible. It is advisable that there should be two entrances, one for either sex, leading into a waiting hall, from which access to the bath is obtained. The bath hall ought to be in sections or blocks so arranged that they may be used for males or females as required. Should there be ample room at disposal the size of the dressing-rooms would not be too large if made 4 feet 4 inches by 3 feet 6 inches, and the bath-rooms could be the same size; the minimum size of either room should not be less than 3 feet 6 inches by 3 feet 3 inches; the corridors may be from 4 feet to 6 feet wide, 5 feet is a fair good width if the corridor is not over 30 feet long. The plan of the Liverpool People's Baths may be taken as a fair example when two entrances are provided.

The engineering requirements are not extensive and may be of several descriptions. The crux of the question is to obtain an adequate supply of hot and cold water. The hot water may be obtained by heating cold water with steam in a calorifier from a steam boiler, or by the household or greenhouse circulating system; if either of the latter systems are adopted, provision must be made in the laundry for boiling towels.

*Materials.*

The question of deciding what materials to use in the construction of baths is undoubtedly one that gives architects and engineers considerable food for thought, not so much from

of knowledge of suitable materials, but from the trouble-  
 question of cost.

Public bodies require buildings good and substantial, yet  
 their architect or engineer suggests that for a public bath  
 ought to take the place of wood, and enamelled bricks or  
 ought to take the place of plaster or ordinary brick-  
 and that all pipes ought to be either copper or lead, and  
 then they begin to think their adviser is extravagant or  
 ambitious. It is not so, however; the best and most  
 materials are the cheapest in the end. Buildings  
 to be constructed so that the annual charge for the  
 nance of the fabric is reduced to the minimum, at the  
 me the materials should be such that they give to the  
 ment an air of cleanliness and comfort.

A public building should be erected that will not last at  
 irty years (the term for which a loan is granted), without  
 ssary cost to the ratepayers.

### *Utility of the Spray and Shower Bath as a Bath for the People.*

1. The best medium for cleansing the body.

2. Provides for the comfort of the bather.

3. The economics of the system.

With regard to the first point, undoubtedly the best means  
 oughly cleansing the body is by means of a Turkish  
 not only is the surface of the skin cleansed but the  
 of the pores of the skin are cleansed and the body is left  
 in condition much to be desired. In considering the best  
 for our purpose we must consider the class of people we  
 cater for and the nature of their employment. When  
 consider this we can only arrive at one conclusion, and that  
 we have to cater for a class who have to earn their  
 money the sweat of their brow; only the very small minority  
 of elementary lives, consequently the question of cleansing the  
 of the skin as cleansed by the Turkish bath may be left  
 the question; perspiration during their labours keeps the  
 of their skin in order. What we have to do therefore  
 to cleanse the surface of the skin. That being so the  
 ay and shower bath is the best medium, viz.:—The  
 re from the ring of a shower bath falls in a gentle  
 ur shower on the shoulders of the bather, the  
 he commences to wash at his head and washes down his  
 his finishing the washing at his feet, and whilst this is pro-  
 ing the soiled water is carried away in the drain. Having  
 his head and down to his chest he may, if he so wishes,  
 the remainder of his body with the warm water from the  
 but in either case he terminates his wash with a clean  
 ly. So far so good, but now comes the special advantage of  
 ay and shower. Up to the finish of the cleansing opera-  
 nly warm water has been used. The bather now takes  
 the two handles controlling the warm and cold water;  
 gradually opens the cold and closes the warm supplies until  
 d is full open and the warm closed, thus securing for  
 the most invigorating tonic that it is possible to obtain,  
 ter the pores of the skin which have been opened by the  
 water and the washing are closed he is in a fit and  
 p condition to have his rub down and put on his clothing.  
 The foregoing is sufficient to prove that the shower and  
 ay baths are an excellent medium for cleansing. Now it  
 perhaps well to show why the ordinary slipper bath is  
 al to the spray and shower. Imagine a man who has  
 employed in some dirty occupation and whose body has  
 the extent owing to perspiration been rendered filthy by  
 at with his work; this man takes a hot slipper bath, what  
 result? He gets into the bath, soaks himself, washes  
 off his body, which in consequence thereof becomes  
 the liquid he is bathing in; it is an impossibility for  
 at an to leave the bath clean. He has simply fouled the  
 and bathed in it.

The comfort of the bather is obtained by the following,  
 cleanliness and cheerfulness of the bathing establishment,  
 of light and air, pure atmosphere kept at a proper  
 rature or temperatures, privacy, proper waiting-rooms,  
 ng-rooms and bath-rooms.

The bather completing his bath with a cold shower and spray  
 at take cold after bathing, and this bath it is proposed to  
 the working-men of Liverpool and their families at the  
 cost of one penny.

### *The Economy of the Shower and Spray Bath.*

In comparison to the slipper bath the shower and spray  
 by far the most economical. Given both a dressing-  
 and bath-room, it occupies only half the floor space of an  
 ry slipper bath-room, therefore the building cost per spray  
 nder bath is considerably less than per ordinary slipper  
 The cost of maintenance is also very much reduced.  
 ordinary slipper bath consumes on an average 50 to 60  
 of water, not including the shower where one is  
 ad; the shower and spray bath, even when most lavishly  
 does not consume more than 10 gallons of water. In  
 situations the quantity of water consumed is of vital

importance, particularly when a dry season like last year is  
 experienced, but even to those places that are blessed with an  
 abundant supply of water the quantity of water used is of great  
 importance, inasmuch as the cost of fuel for heating must be  
 five times greater for ordinary slipper baths than it is for  
 shower and spray baths. The number of attendants required  
 to work the baths is in favour of the shower and spray baths,  
 as there are no baths to be filled, and what is of the greatest  
 importance there is not the slightest possibility of drowning  
 taking place, certainly not accidentally, and even if a bather  
 wished to commit such a rash act as suicide he would have the  
 greatest difficulty in accomplishing it.

One shower and spray bath will do the work of at least two  
 slipper baths, the time occupied in taking the shower and spray  
 bath being half the time occupied in taking a slipper bath; in  
 most cases it will be found that the proportion will work out at  
 three to one.

There are many more points connected with people's baths  
 that I could introduce into this paper did time permit. I have,  
 however, already trespassed too long upon your time and  
 patience, inasmuch as the subject might have been much better  
 handled by a more experienced man than myself. If, how-  
 ever, what I have put before you to-night helps any one of you or  
 induces you to take an interest in and make a study of how  
 best to design baths for the people, my object will be attained.

If the baths now built become popular with the working  
 classes, I hope before long the Corporation of Liverpool will  
 erect others at distances of about  $\frac{1}{4}$  to  $\frac{1}{2}$  a mile along the entire  
 system of their 7 miles of docks, the entire cost of which  
 would not exceed the cost of one of their existing large  
 public baths, which averages from 20,000*l.* to 30,000*l.*

## ARCHITECTURE IN SYDNEY.

AT the opening meeting of the present session of the  
 Institute of Architects, Sydney, an address was delivered  
 by the newly-elected president, Mr. G. Allen Mansfield. He  
 said:—

I claim that it is both our privilege and our right to exercise  
 an influence on some of those conditions which go to the build-  
 ing up of a nation. If this be so, it brings us at once to a  
 serious consideration of the relations between the architect and  
 the State. The history of every nation past and present affords  
 abundant evidence that architecture plays a prominent part in  
 its civilisation and in the development of its taste. Its build-  
 ings form a record of its culture or its barbarism. They are a  
 measure by which men can judge of its place in the scale of  
 nations, a vivid expression of the intelligence of its people. If  
 it be the duty of the rulers of a State to foster all that con-  
 tributes to the enlightenment of a community and to the exalt-  
 ing of its standard of civilisation, it surely follows that the  
 encouragement of the noble art of architecture stands in the  
 foremost rank of the obligations that a Government owes to  
 the people, to the land, to itself and to history. To fail in that  
 duty is an offence against the country. To assume of set  
 purpose an attitude unmistakably hostile to the development  
 of our art by other than strictly departmental routine falls little  
 short of a crime. Yet such is the attitude assumed by the  
 Government of New South Wales to-day. Let those who are  
 responsible for it say why; let them dare to avow to the world  
 what secret springs of self-interest prompt them to so manifest  
 a violation of one of the clearest obligations they owe to the  
 country at large.

Of all the buildings that give character to a State, those  
 which we are in the habit of calling "public buildings" rank first  
 in prominence and importance. Is it then fair, is it reasonable  
 that the creation of these landmarks of our State should be  
 restricted to the efforts of one man, no matter how able that  
 man may be? Is it just that to one mind, aided doubtless by  
 able officers of his department, there should be entrusted that  
 work which should be truly representative of the people as a  
 whole? In a State, one-man art is a calamity. In a Common-  
 wealth it would be a national disaster. Not so were the glories  
 of the great cities of the world evolved—the monuments of our art  
 ancient and modern which reflect the genius of a people. Not  
 from the brain of any one or any ten men can a national senti-  
 ment be crystallised. A régime so discouraging to ourselves,  
 so unfair to our fellow-countrymen, who are taxed to pay for  
 our great works, should not be tolerated, it should be swept  
 away by the force of public opinion. It is not for us to go cap  
 in hand and plead for some kind consideration at the hands of  
 a Government. We claim as a right a share in the great work  
 of writing in brick and stone and marble some records of the  
 art of our time.

We are passing through a period of lavish expenditure on  
 public works, such as must for all time leave its mark upon the  
 State, and in the near future sums will be expended so vast as  
 to demand the thoughtful and serious consideration of those  
 who are charged with the expenditure as well as those from

whose pockets the money will come. The more it behoves us to make every effort to arouse the public mind to the enormity of the present narrow and selfish policy that precludes all possibility of expansion and crushes all ambition in the breasts of the young aspirants to future fame in their profession. I have on previous occasions stated publicly that the pernicious system here adopted by the Government is one of its own devising, its own brilliant inspiration. It has no parallel in any other civilised country on the globe. On the occasion of the visit of the representatives of our Institute to the Minister for Works, while the principle for which I contend was not seriously disputed, it was stated that in the practical application of that principle difficulties arose which rendered its adoption troublesome if not altogether undesirable. I affirm that such difficulties are altogether chimerical, and that in the hands of competent and impartial advisers they would disappear. Reviewing the attitude of our State Government to its private architects, the question presents itself with surpassing interest, whether in the creation of the capital city of our Commonwealth the Federal Government will be influenced by the same narrow and illiberal views that actuate the Government of New South Wales. Of this I have but little fear. So far as the practice in other States is known to me, a different spirit prevails, and it is more than probable that means will be found to make that city a worthy representation of Australian art, a city reflective of national talent rather than of departmental industry. It nevertheless behoves us and our professional brethren of the other States, to watch closely the development of the arrangements under which this great national movement will be set going.

That a controlling power is necessary to secure harmony and to mould the enterprise into a fitting shape must be admitted as an undoubted necessity. Herein, however, the danger lies. A controlling body once established is, as a rule, prone to arrogate to itself too extensive powers. To exercise the difficult and delicate task of judicious guidance of the whole vast scheme there are needed men of broad and comprehensive minds, of patriotic spirit and far-seeing wisdom, and free from any taint of self-seeking. Can it be doubted that the nation can produce the men? To endeavour to find them is the duty of the Federal Government. The constitution of such an organising power necessarily involves the representation of various professions, it demands the combined knowledge and experience of several forms of art and science, with some assistance perhaps from the purely "business man." Architecture, the fine arts, engineering, sanitation, must all take part in the great work. Possibly a Royal Commission would be the most convenient form for the governing body to assume. This, while formulating the general outlines of the scheme, and establishing conditions which will prevent any confusing and clashing of individual efforts at a later stage, must still contrive to give such opportunity for the individual skill of the sons of our art in all the States as shall tend to work out an expression of national character.

Among the subjects to which I hope the attention of the Institute will be directed during the ensuing year is that of an improved Building Act. Not necessarily an entirely new Act, because, on the whole, the one under which we have been working since the year 1879, viz. "The City of Sydney Improvement Act," meets very fairly the requirements of the case. In some not unimportant respects, however, it needs amendment and revision. In the first place, the present title of the Act should be abolished and one more expressive of its primary purpose be adopted. The natural title of the Bill is surely "The Metropolitan Building Act." The whole of the provisions for the establishment of the clumsy and effete "City of Sydney Improvement Board" should be swept away. The Board has practically effaced itself, a result inevitable to a body founded on a principle wrong in itself and impossible of application. In a new or revised Act, I trust due consideration will be given to this point. It seems to me that a board of appeal would be properly constituted which consisted of three members only, viz. an architect, a builder and a business man. This body should have no power of initiation, and should sit only when called into action by an appeal.

A matter which cannot be overlooked by the framers of a new Act is that of regulating the height of buildings; here a sound judgment and a careful consideration of the various interests involved are highly necessary. While restricting the number of storeys to a limit manageable in the event of fire, it must not be forgotten that the city of Sydney has special conditions of its own which demand attention. Sydney, as a whole, covers a considerable area, but the Sydney par excellence—the heart of Sydney, the Sydney which is the centre and pivot upon which all its outer fringes hang—is of very limited extent, and by no possibility does it admit of any expansion. The headquarters of Government, of all our great financial institutions, of shipping concerns, of insurance companies, and of all commercial interests will always find their home in the area bounded by the waters of the harbour on the west, and on the north by the Domain, and Hyde Park on the east, and by, shall we

say, Bathurst, or at the very furthest, by Liverpool Street south? Within these limits the mainsprings of all that constitute the life blood of the community will ever be focused. No city railway, no North Shore Bridge, will effect any change in this respect. For all practical purposes this Sydney may be regarded as an island. Hence it follows that to place too rigid a restriction upon the height of buildings would be a grave error. That the operations of all the various business centres above enumerated, and hundreds of others that inevitably cluster around them, will grow with giant strides in the near future is certain. More men will be needed to cope with growth of trade and more space for the work in under healthy conditions. As it is impossible to extend the area of this space by lateral expansion the only resource lies in the multiplication of area by more and more floor space up to such a limit as shall stop short of a danger. It is not for me here to state the provisions of an Act. Let it suffice to allude to a few points which must not be overlooked—such as increased powers to the city authorities to enable them to deal with advertising hoardings and the hateful sky signs. To assist the Council to secure the passage of such an improved Bill at an early date should be a congenial task to this Institute, there is reason to believe that that body would gladly welcome any assistance which we can give them to this end.

Nor must our attention be limited to the boundaries of the city proper. The suburbs equally claim consideration. Within the jurisdiction of the Metropolitan Board of Water Supply and Sewerage are no less than fifty municipal boroughs, many of considerable importance, and in themselves closely approaching to the magnitude of a city. It is a reproach to our system of self-government that up to this day there is little or no control over the buildings with which many of them are crowded. Nor is it the first time that I have publicly advocated the importance of this question.

#### M. AUGUSTE RODIN.

ON the 15th inst. the committee of the Rodin Statue Fund gave a dinner to M. Auguste Rodin, the sculptor, who worked St. John the Baptist has recently been added to Victoria and Albert Museum, South Kensington.

Mr. George Wyndham, M.P. (the chairman), in proposing "The Guest of the Evening," explained the origin of the assemblage, and said that Mr. John Tweed had suggested the artists of England owed it to England, to art, to themselves to obtain for South Kensington one at least of Rodin's masterpieces. Then Mr. Ernest Beckett presented a masterpiece to the museum. But the British artists were to be denied, were not to be disappointed of so engaging a proposal. They in their turn secured the St. Jean. So now we were met to crown these operations with a banquet to the man who inspired them. In respect of modern sculpture, and, above all, of modern French sculpture, we had in this country to contend largely with faith without works. Let them imagine the situation of a young British sculptor. He had, it was true, in the British Museum an incomparable treasure-house of Greek masterpieces. He had in South Kensington many reproductions of Greek sculpture and of Renaissance work, including some reproductions of that truly great master, Jean Goussier. But, coming to modern French sculpture, what had he? A cast of Barye; a small torso of Le Gros; nothing of Houdouin or Carpeaux, of Puget, of Rude; and, until this movement of Rodin. He hoped that next year they would be able to get together a collection of Rodin's masterpieces. Was it beyond the bounds of possibility that the movement, crowned for the time by that dinner, should issue, as a next stage in the long road they hoped to recover, in creating so sunlit pavilion where the masterpieces of Rodin might for time be bathed in that radiance of the sky which could also reveal the magic of their contours and their values? He was the strenuous and perfect workman, knowing all there was to know of the truth, and therefore of the beauty, and therefore of the power, of the human form; knowing, too, all there was to know of the aptitude of clay to receive, of marble to declare his own intimate interpretation of those large secrets of the universe which escaped the narrow definition of logic and language.

M. Rodin said that even twenty years ago, when he visited London, he was received with a kindness and courtesy of which he had retained a most lively recollection. He was then greatly impressed and influenced by the beautiful and instructive collections of art he found here. The Greeks, especially, he found had produced with fidelity the form of man becoming divine, and he thought people would never be sufficiently permeated with the idea that everything that was true to nature was beauty. Those who lived in the very midst of that beauty too often failed to recognise it. Only by persistent labour and by a long and comprehensive contemplation of nature could

to see a new world open out before them. Thus in the Temple of Sety, explaining its purpose and design. The usual exhibition will be held during July at University College.

rench Ambassador, in replying to the toast of "France," said he was extremely touched by the sympathy which had been expressed for his country, and he could assure them that such sympathy would be appreciated by all Frenchmen. He would thank them, also, in the name of his country for the honour they had done to one of its sons by choosing M. Rodin for honourary member of the Académie des Beaux-Arts. In choosing M. Rodin for honourary member of the Académie des Beaux-Arts, the French Government had ratified in the judgment of posterity.

### LIVERPOOL CATHEDRAL.

The Bill promoted to give statutory authority for the purchase of the St. James's Mount site and the erection of a cathedral for the diocese of Liverpool came last week before the House of Commons. The preamble was proved by Mr. Morley, chairman of committees of the House of Commons, and Mr. Chavasse, Secretary of the cathedral committee. It was stated that £156,000 has been subscribed towards the cathedral, and that a meeting held at the Town Hall had adopted the site of the cathedral. With the exception of St. James's Mount site, the site belonged to the Corporation, and in regard to the cemetery the cathedral committee proposed, with the consent of the trustees, to take over the trusteeship. They considered that the cemetery should form part of the cathedral. It was now very little used. Pending the establishment of a dean and chapter the cathedral was to be in the Ecclesiastical Commissioners, and the bishop was to be dean. An additional provision was submitted that when it was certified that any portion of the cathedral was fit for the celebration of divine service the Ecclesiastical Commissioners were empowered by Order in Council to transfer the pro-cathedral of St. Peter to the new cathedral, to substitute the church of St. Nicholas for that of St. Peter's Church, and to dispose of the building of St. Peter's Church. With this amendment the Bill was ordered to be reported to the House for third reading.

### EXCAVATIONS IN EGYPT.

On the 15th inst. Professor Flinders Petrie delivered his annual public lecture at University College, describing the excavations of the Egyptian Exploration Fund during the winter at Abydos in Upper Egypt. In previous years, he had shown the order of the prehistoric period had been determined, the series of Royal tombs had shown the earliest of the kingdom. The present year's work had confirmed these ages and proved how the end of the prehistoric period had been determined. A town founded in the age of the early dynasties. A town founded in the age of the beginning of the kingdom, three centuries before Menes, was behind the earliest sanctuary, that of Osiris. This was repeatedly rebuilt, and a stratified mass of remains gradually accumulated at the average rate of 20 inches a year. This deposit has now been explored and all the flint tools, amulets and other objects compared. We possess the continuous written record of 7,000 years of Egyptian history, united to the earlier stages of civilisation, covering a couple of thousand years before the written history. It has yielded hundreds of pottery jars and bowls of a variety of shapes, some hundreds of flint tools, the tools with which the stone bowls were manufactured, pottery fireplaces decorated with patterns, examples of the tiles made for wall decoration, the amulets, ornaments, and all of the beginning of the historic times. A large grave full of vases of stone and pottery were found in the town; these will be reconstructed in original form in different museums. The Temple of Osiris, dates as far back as the beginning of the eighteenth dynasty, about 1500 B.C. The temple ruins were inscriptions and statuary ranging from about 3,000 years, including some fine architectural pieces of the seventh and eighteenth dynasties, a striking red granite of a king of the twelfth dynasty, some portraits of the thirteenth dynasty kings, and some broken statues of goddesses, which show a hitherto unknown revival of very pure style of the thirtieth dynasty. The next lecture will deal with the discoveries in the cemeteries, which include the largest

tombs known in Egypt, and the work around the Temple of Sety, explaining its purpose and design. The usual exhibition will be held during July at University College.

### THE PALACE OF KNOSSOS.

THE following important communication from Mr. Arthur J. Evans appeared in the *Times* of Tuesday:—

On February 14 last I was able, thanks largely to the generous assistance given through the Cretan Excavation Fund, to resume the work of excavation in the prehistoric Palace of Knossos. It may be said at once that the results of this season's work have, so far, not fallen below the high level of the two preceding years. Great difficulties have, indeed, been encountered both from the persistent and quite exceptional rainy weather, and from the constant necessity of propping up and even of partially reconstituting walls in order to preserve the remains of upper storeys which distinguish the recently excavated parts of the Palace from almost all ancient buildings. The conservation of these seemed such a plain matter of duty that neither labour nor expense has been spared to this end; and, thanks to the constant watchfulness of my assistant, Dr. Mackenzie, and the architectural resources of Mr. Fyfe, the difficulties and not inconsiderable dangers of the work have been so far overcome that throughout a whole quarter the upper plan of the building is now almost as clearly marked as that of its ground floor.

Those who have followed the former course of the excavations may remember that their result had been to uncover an eastern wing, which seems to have been mainly reserved for State and religious functions, business and storage, a great central court, and beyond it to the east a part of what seemed to be the royal residential quarter. At the close of last season's work a staircase had come to light here leading down by a triple flight to a hall with double tiers of colonnades, and beyond it a larger columnar hall or Megaron. On the upper level north of these ran a corridor, beneath which another corresponding passage of lofty dimensions has now been cleared out, originally lit by a large window opening on the light-well of the larger hall. The clearance of this was marked by the discovery of a very extensive deposit of inscribed clay tablets—the largest, indeed, yet discovered—including about 100 perfect documents dealing with Palace accounts. The decimal system is here much in evidence, and a large proportion of the tablets deal with percentages. With these were several large clay impressions of what must certainly have been a royal signet ring, exhibiting a goddess and her attendants, of which a counterfeit matrix was found last year in another part of the building—a proof that fraudulent procedure was not unknown even in the household of Minos.

The spacious chamber bordering this corridor, which from the signs cut on its walls I have called the "Hall of the Double Axes," was found to have a double portico at its further end, facing both south and east. In its south wall had been already visible last year a doorway leading to a finely-paved passage with a "dog's leg" turn, as if to insure the privacy of some important room beyond. Here has now been uncovered a quite original chamber flanked on two sides by a high stylobate, which also serves as a base for seats, between the original pillars of which light was obtained on the one side from a portico, on the other from an area with a back wall stepping back above. On the west side of the room an opening in the balustrade gives access to a small bath-chamber, above the gypsum lining slabs of which a fine painted frieze of spirals and rosettes was still partly clinging to the walls. Remains of a painted terra-cotta bath were found near. Of the wall-paintings that originally adorned the room itself and the portico beyond very interesting remains were also found, though in a fallen condition. Quite an aquarium of fish has here come to light very naturalistically rendered, including parts of two large dolphins and many smaller fry, some of them complete. This discovery supplies the counterpart to the fine fresco showing flying fish found by the British school in the prehistoric settlement of Melos—a work which must now be definitely assigned to an artist of the Knossian school. Here, too, as those different tones of blue had to be mainly reserved for the fish themselves, the sea-water itself was indicated by azure wreaths and coils of dotted spray on a white ground. The expedient is most artistic, but could anything be less "classical"?

The upper part of an elegant lady in a yellow jacket and light chemise introduces us to a different class of subject. Her flying tresses and outstretched arm suggest violent action, and this is still more perceptible in the subject of another fresco fragment showing a more nude female figure in the act of springing from above and seizing the horns of a galloping bull. Remains of a series of scenes exhibiting female terrors were already found towards the close of last season's dig, and it has

now been possible to reconstitute a complete panel of one of these fresco designs. The whole is a *tour de force* of ancient circus shows. A Mycenaean cow-boy is seen turning a somersault over the back of a charging bull to whose horns in front clings a girl, in boy's costume, while another girl performing behind, with outstretched hands, seems to wait to catch her as she is tossed over the monster's back. The fallen body of a man beneath another bull brings out the grimmer side of these Minoan sports.

A very interesting feature of the newly-discovered hall, which will be specially appreciated by Homeric students, is a private staircase opening to its north wall and leading up by a double flight to upper rooms. On the west side of the hall opens a passage leading to what must have been the most secluded part of this residential quarter of the palace. Here, again, remains of the upper-floor levels are well preserved, and a stone bench is still in its place against the wall of one of the upper rooms. The innermost of this group of chambers have as yet been incompletely excavated, but the work here has already been productive of some important results. At one point are remains of what appears to have been a wooden staircase, the upper part of which was found literally choked with broken seal impressions from what must certainly have been a secretary's office on the upper floor. One of these impressions, though only a fragment, is of great interest as bearing part of the impress of a late Babylonian cylinder, thus supplying direct proof of correspondence with the East. A very remarkable feature of this quarter of the Palace is the elaborate drainage system. The well-paved floors are underlaid by quite a network of stone channels, in places crossing each other at different levels and roomy enough to allow a man to crawl along them. A succession of stone shafts leads down to these from the upper storey, in one case apparently connected with a latrine, of which a curious and in some respects very modern example also occurs on the ground floor. In another part of the palace sections of a terra-cotta drain-pipe have been found of a most advanced form, provided with stop-ridges.

South of the truly royal group of chambers above referred to is another quarter, with smaller rooms, perhaps mainly occupied by servants and minor officials. Archives were also kept here, as is shown by the discovery of parts of two hoards of inscribed tablets. One contains lists of persons indicated by the man-sign; the other refers to the armoury, and exhibits, besides the linear characters of the inscriptions, outline figures of swords. In addition to these finds of tablets, the pottery of this and the adjoining region has produced some quite new illustrations of the prehistoric writing of Crete. Besides graffiti, a fragment of a Mycenaean vessel shows a painted inscription analogous to those of later Greek vases, while the inside of a cup is filled with three lines of linear inscription written in ink, like those of Egyptian ostraka. Near the magazine containing the tablets was another with vases in the earliest Palace style, some of them painted with very naturalistic lilies. An adjoining chamber contained a kind of domestic shrine of the highest importance in its bearing on the local cult. On a small dais, beside a tripod of offerings, and with a miniature votive double axe of steatite before her, rose a painted terra-cotta figure of a goddess, pillar shaped below according to the old religious tradition, and with a dove on her head, while in front of her stood a male votary holding out another dove. That a goddess was associated in the Palace cult of the double axe further appears from a gem on which a female divinity is seen bearing this symbolic weapon in her hand.

On the eastern slope of the hill the limits of the palace have extended themselves beyond all anticipation. A good deal of denudation has here taken place, but among the finds are remains of a large architectural fresco with realistic imitation of veined marble, and store jars more capacious than any yet brought to light. A stone spout jutting out from a neighbouring wall and connected by a conduit with an oil-press above explained at once their contents and their means of filling. Further down, and here forming the outer eastern boundary of the palace, are massive lines of supporting walls; at one place five are within another at intervals of only a foot or so, and a bastion with ascending flights of steps flanked by curious water-runnels.

Some excavation has yet to be carried out in the central parts of the eastern quarter, and the boundaries have yet to be delimited towards the north-east; but there is every hope that the main work may now be completed by the end of the present season. The remains already brought to light cover an area of about five acres, and their exploration may be said to have opened to the eyes of history a new world, already ancient when Homer sang, but presenting a civilisation in some respects strangely modern. It would seem, indeed, as if the brilliant and unexpected character of the finds was likely to maintain itself to the last. The exploration now proceeding, of the basement spaces within the upper eastern terrace has brought to light, below the level of the later palace, walls belonging to

a still earlier royal dwelling. Within these were found vases of the older class, the decorative designs and contour of which sufficiently attest the high architectural development attained here in this still more archaic In this early stratum was also found a miniature vase of and porcelain, the thimble-like receptacle of which contained some perfume as precious as attar of rose too, as if to illustrate the continuity of the local remains of a miniature pillar shrine of painted terra-cotta doves perched on its roof. But one of the later paintings, at a slightly higher level than this, contained a tectural record of still more universal interest. It remains of a mosaic, consisting of small porcelain tiles which in its original form seems to have represented a shield—the walls and houses of a city, a river, a vine, trees, warriors with bows, spears, and throwing besiegers and defenders, and various animals. But the surprising part of all are the houses of which the city was composed. Fragmentary as are their remains, it has been possible to reconstitute about a couple of score of these. The character of the structure—stone, timber and rubble—is accurately reproduced; and the walls show the ways—a whole street of a Minoan city rises before us as it originally stood. But what is even more surprising is the fact that the elevations of these prehistoric structures can be thus recovered for us intact from the gulfs of time, altogether modern character of some of their features are three-storeyed houses (some of the semi-detached showing two contiguous doorways) with windows of four or double windows of three panes each, which seem to show that the inmates of the houses had actually some space for glass.

## THE WINCHESTER REGALIA AND PLATE

I HAVE much pleasure in rendering to the Field Club information as to the regalia and plate of the famous city, and in doing so it will be satisfactory to know by means of the Press a permanent record will be made. Beyond doubt the city possessed very ancient maces and valuable plate, but, save some Stuart freemen's gifts, none have been spared. Charles I. received much to help his army, and Winchester was Cavalier till overawed, and, on the restoration of the Monarchy, Charles II. did not replace the gifts of his father. I propose to briefly review the regalia history from transcripts of the civic MSS., and the mention of it does not reach back beyond 1594, when it is recorded that Richard Adderley was appointed to the place and room of Constable's sergeant, and to have the mace and profits of the office unto belonging. The sergeants evidently carried small maces like the ward maces carried still in the Metropolis. None of these has come down to us. In 1596 20 nobles were devoted to the repairing, new making and amending of maces, which seems to indicate antiquity, perhaps as far as the Plantagenets, and much wear or ill usage. William Adderley, a sergeant's mace in 1598 in connection with a curious entry relative to a hunt after recusants—a form of execution and enforced finance much in evidence in Elizabeth's reign, and the ruin of several Hampshire Catholics. A sum of the entry will be interesting and amusing, and I found the house was in Kingsgate Street. The date of the spirit and cry was Sunday, November 26, when there was a visit from the Lord Bishop and other commissioners, and a dinner was made by the mayor, Richard Adderley and Christopher Gray, constables, assisted by Thomas Bedham, Sergeant Adderley, Richard Adderley and others in the house, late Pottinger's, where information was given that sundry recusants dangerous to the State were harboured. The searchers found old Mrs. Goldsmith, a widow, and the widow of Mr. Martin's son, and the servant of old Mrs. Goldsmith, a daughter of one Church, of Michelmersham. In the course of the search the servant said someone had stolen her purse and four shillings. The mayor was assured the maid had invented this of spite. The mayor, out of his regard for the city's peace, searched every person without avail, and thereafter repaired to the cathedral. After the sermon the search was renewed, when Richard Adderley, one of the sergeants, found himself likely to be discovered, and his conscience touched on his knees and prayed forgiveness as he was the thief. The mayor summoned his fellows by tolling the town bell twice, the result Adderley forfeited gown and mace and was imprisoned in Westgate, where we will leave him and follow the history of the old maces. In 1599 Richard Lorey, of London, goldsmith, was paid 13*l.* 6*s.* 8*d.* for mending the three maces of the city with silver gilding and making. In 1632 Thomas H. goldsmith, of London, altered the maces for the sergeant

\* A paper read by Mr. W. H. Jacob, J.P., before the Ham Field Club and Archaeological Society.

at a cost of 12*l.* 3*s.* 8*d.* In 1651 26*l.* was spent in the maces with Republican or Commonwealth baubles, 1660 they were again purged of the Roundhead maces and made regal at a cost of 26*l.* We now come to the clearing up of the regalia and disposing of them as old sad event certainly, but the transaction has come down in detail, and the year of sale and production of the fine before us was 1722-23:—

	£	s.	d.
1722. Paid to Mr. Gilbert Beare, for mending the old maces to pieces—weighing and them up.	0	15	0
2, 1722. Mr. Waldren, carrier, carrying the London	1	1	0
at 3 <i>d.</i>	0	3	9
payment to B. Pyne, goldsmith, of London, for ces.	19	1	10
of the fines bag for trades towards the maces	45	17	8
723. Paid to Mr. B. Pyne	24	0	0
	90	19	3

present maces are fine examples of work of their kind. de several maces—amongst others for Gravesend and ge. The largest mace in England is that of Oxford, nes, and next come equal in size Winchester and each 63 inches. The oldest mace in Hampshire is ne at Southampton, time of Henry VII. Before we t maces there is a laughable story of some admirers of t family, and evidently alludes to the first appearance y's mace:—"Civitas Winton. The information of rleton, sergeant-at-mace, upon oath this 3rd day of er, 1722, that on Friday, Aug. 31st, about one hour Majesty had passed through the city, he saw Anthony , junior, carry in procession on his shoulder a large with the roots on it before George Todd, victualler, in Street. He saw it brought out of the Red Lion and efore the said George Todd, and he verily believes it ed before the said Todd with intent to ridicule the nd aldermen of the said city, who had just before d their mace before His Majesty." No doubt it was a erilous one then; in the interest of James II.'s son. ts review the plate. Of this there must at one time n a good lot, for freemen made presents. Corporate against the mayor's dignity were fined in plate, and n purchased the privilege of exercising their crafts or s by presents. There is a notable example of an y citizen on July 9, 1630, when William Wiltshire, assaulted the mayor, and was fined 30*l.*, which was duly n the coffer by Mr Lancelot Thorpe, and the money eployed in purchasing a silver basin and ewer, weighing z. The same year William Withers, on being sworn a a gave 2*s.* towards a great silver salt, and in 1632 a Cropp paid 5*l.* to provide two out of three silver beer In 1643 Charles's troubles are recalled by the follow- y:—"Taken then out of the coffers these several s of plate and delivered to Mr. Jasper Cornelius, ap- o receive the same for His Majesty's use, by virtue of d sent by His Majesty to the mayor and aldermen for a of money or plate for the maintenance of the army by ent of the mayor and all the aldermen. The plate is e mentioned:—

	Oz.	Dwts.	Grains.
the silver ewer, weighing	32	4	1
three silver beer bowles	34	4	1
three silver wine bowles	14	4	3
the gilt bowl with cover	31	4	2
the great silver salt	28	—	—
the silver tankard	19	4	2
the silver bason	74	—	—
	235	4	1

—58*l.* 16*s.* 3*d.*" Need we say that the loan has long been written off as a bad debt, even as was Charles II.'s at Child's Bank. There are still some freemen's gifts of corporation plate—chest, and now shown before us. On er 6, in the year 1660, and of the king's return, amidst alutuous joy of the people who welcomed freedom from t, Sir John Norton, baronet, Sir Humphrey Bennett, and Lawrence Hyde, of Catherington, esquire, and os Mason, esquire, of Woodiham (Odiham), were made e Guild of Merchants, and called to the Bench. The e water dish and biscuit-box, if so it may be called, was of three of the above freemen, who are commemorated

Donum Johannis Norton, baronetti;  
Humphredi Bennett, equitis aurati;  
Laurentii Hide, armigeri.

gift is a very handsome one, and still useful at civic tis. There are two handsome gifts of worthy citizens— steward's, the Earl of Northbrook's, splendid example n work in silver, and a goodly and capacious loving ven by Alderman H. Webb, as a memento of his

mayoralty and the Diamond Jubilee of our much-loved Queen Victoria. Mr. R. Moss has graced the Sessions Hall with a grand pair of Doulton's vases and a present of a coronation table cloth with a history.

There are examples on view of the bribes or payments offered the civic authorities for permission to practise trade without being apprenticed and free of the city. In 1672 one Bennett Creed was presented for making use of the trade of a silk weaver contrary to the ordinances of the city, whereby he had incurred a penalty of 40*s.* a month—"Item, we present Mr. Bennett Creed for entertaining Edward Berne, a journeyman." Written in the margin are the words—

To be considered off.

A warrant to have him before the Mair.

Our silk weaver compromised the offence by the gift of the elegant little wine vase and cover before you. "The gift of Bennett Creed to the city of Winchester" is engraved on it. In 1673 Thomas Stubington, desirous of exercising the oleaginous and not pleasant mystery of a tallow chandler, was allowed to do so. "He was to use the trade and no other, he paying to the city a dozen of silver spoons, price 6*l.*, the spoons to be paid within one month, otherwise the ppsal to be void." He paid, and you see the fine old spoons good and capacious enough, whether for soup or green peas. Finally, the MSS. inform us:—"The city plate, which has now become by length of time unserviceable, be weighed up and exchanged for the same weight in ounces, in useful and convenient plate, and the expense of exchange paid out of the coffers." The foregoing gifts happily escaped. The above entry was in 1759. Alas! that the old silver fell a prey to Georgian Goths. It weighed 222 ozs. and realised 55*l.* 10*s.* 3*d.* The new plate, a substantial lot, cost, inclusive of the convenient technicality "fashion," 78*l.* 19*s.* 10*d.*; deduct old silver, 55*l.* 10*s.* 3*d.*; actual cost, 23*l.* 9*s.* 7*d.* The sauce boats, salts, spoons, glasses and engraving are to be seen. Long may they grace the civic Board, and yearly may we have such a mayor as now fills the civic throne and carries out, aided by the mayoress, the duties of the Sovereign's lieutenant in this Royal city, to which he, like his predecessors, is wedded by the fine old gold ring of Alderman White, charged with the city arms. The donor filled the mayoralty thrice, and on October 21, 1653, his widow gave 2*s.* 6*d.* to make up a gold ring given by her late husband—"full three pounds." Thus ends the story of our regalia and plate.

## TESSERÆ.

### The Cathedral of Old Sarum.

THE long-perished cathedral of Old Sarum was of considerable interest, both in an architectural and in an historical point of view. Lanfranc in his wise policy caused the seats of many English bishoprics to be transferred from insignificant to more important places, by decree of the Council of London, held in 1075. At that time Herbert of Lotharinga was Bishop of Sherborne and Wilton, having some time before united the sees. Coming under the operation of this decree, he commenced the building of a new cathedral within the precincts of the castle of Sarum, his future episcopal city, so that it was one of the earliest great churches built under the Norman dynasty. Herbert soon died, and was succeeded by Osmund, who, having exchanged the life of a noble for that of a churchman, and having been eminent for his sanctity, was canonised in the fifteenth century, leaving a name memorable in the English Church as that of the compiler of the Sarum Use, so long the most generally received ritual of the English Church, and the use in which our present service-book is founded. St Osmund in 1092 completed and dedicated the cathedral in honour of St. Mary. Five days afterwards the roof was destroyed in a storm. During the whole of the turbulent twelfth century this continued to be the cathedral of the diocese, though situated on a bleak and circumscribed area, and within the walls of a fortress where the churchmen were exposed to all the insults of a barbarous soldiery. At length, however, in 1220 Bishop Roger Poore laid the foundation of the present cathedral of Salisbury, in a spot which was then meadow land, and in 1226 translated the bodies of St. Osmund and of two other predecessors into the new church. Edward III. gave letters patent to Bishop Richard de Wyville, granting to him and the dean and chapter "all the stone walls of the former cathedral church of Old Sarum, and the houses which latterly belonged to the bishop and canons of the said church, within our castle of Old Sarum, to have and to hold, as our gift, for the improvement of the church of New Sarum and the close thereunto belonging." It is supposed that the upper portion of the tower and the spire was built with these materials. The dimensions are given as follows:—Total length, 270 feet; length of transept, 150 feet; of nave, 150 feet; eastern aisle, 60 feet; breadth of nave, 36 feet; of aisles, 18 feet; whole breadth of transepts, 60 feet. There are vestiges of cross foundations towards the west end, crossing the aisles.

## Subject in Early Italian Art.

The early sepulchral art of Italy clings to nature, and symbolism direct from nature, aiming at the character of natural objects. Its vines are from nature; its sheep are made as like sheep as the painter or mosaicist can manage; its doves are just like real doves, and its palm trees like palms. Even the later Byzantinism retained reference to nature and truth in conventional work. Moreover, it seems clear, from passages from De Rossi, that the Christian artists of the later empire were like the Gothic Christians in this other great respect, that they desired to bring all things into church to represent all their ways and thoughts in their sacred places. Of course peaceful and weak men did this in a different way from warlike and strong men. The Veronese churches show us how the Lombard Goths did their work. Let us take De Rossi's account, and see how secular things and crafts and pursuits are represented by Græco-Roman Christians in the catacombs as in Gothic churches. "It is a fact I have constantly observed," he says, "in the subterranean cemeteries that Christians of the earliest time made use of sarcophagi, without any especial Christian symbols upon them, and probably the work of heathen hands, containing images of the stars and seasons and scenes of pastoral life and agriculture, some even of the chase and some of a comic character. The Christians gave their own sense to scenes of husbandry and shepherd life, personifications of the seasons, dolphins and sea monsters. Anything that was free from idolatrous imagery, or did not actually represent Pagan deities, they freely made use of." And he goes on with curious illustrations of the Christian desire to find foreshadowings of the history of their own faith in ancient legend. We all know how Orpheus, in particular, is used in the Callixtine and other catacombs as a symbol of Our Lord; so also with representations of Hercules, Deucalion and others. The Christian symbolist, or parabolic artist, had no more hesitation in using a heathen myth to impress a fact of Christian history than he had in using Pagan paint or Pagan brushes to record it on the cemetery wall.

## Progress of Greek Sculpture.

Few there are who could recognise in the rude primæval efforts of Greek statuary the visions of breathing life which have been moulded by the hand of a Phidias or a Praxiteles; how transcendently surpassing the inert masses of early caricature are the glorious creations of their consummate skill. Even the trained mind is dazzled by such astonishing results, while the undisciplined mind receives them as convictions of inspiration. Men are willingly captivated by the wonderful; less so by the realities of laborious study. They find it fatiguing to accompany the steps by which eminence is attained; unpleasant to destroy the charm of spontaneous creation. The splendid fiction by which Minerva is said to have sprung, in the full panoply of martial vigour, from the brain of Jove, may have furnished to the Greeks a fair type of omniscient might, but it never can be the symbol of the patient process of perfection which has preceded and accompanied the noblest achievements of man. If, in the triumphs of the plastic art, the Greeks were indebted to a vast fund of original power to perceive and of skill to amend inaccuracies—pure taste to select and ability to execute the beautiful—still beyond these natural and acquired gifts they owed much to the influence of time, and to the experience afforded by the very failures of their predecessors.

## GENERAL.

**The Visitors** to the museums and National Gallery were largely increased on Monday last as the weather was unfavourable to out-of-door enjoyment. The totals for this year were:—Victoria and Albert Museum, 15,491; British Museum, 10,469; Natural History Museum, 10,325; National Gallery, 8,487; and the Tate Gallery, 4,119. The respective numbers for the preceding Whitsuntide Bank holiday were 6,818, 4,865, 5,108, 6,480 and 2,482.

**M. Paul Merwart**, painter, who was one of the victims of the volcanic eruption in Martinique, was by birth a Russian, although his parents were French. He studied in Paris under M. Lehmann and M. Humbert. He was attached to a scientific commission, and was the last tourist who ascended the crater before the eruption. In his last letter he wrote:—"The crater has not, perhaps, said its last word."

**The Governors** of Westminster Hospital have obtained a process under the Building Act against the erection of a stand by the Middlesex Guildhall. The Governors complain that the stand would be directly in front of a portion of the hospital.

**A Thirteenth-Century Mansion** in the Rue du Mirail, Bordeaux, has been purchased by the directors of the local Mont de Piété.

**The Will** of the late Mr. William Larnier Sugden, of the firm William Sugden & Son, architects, Leek, Staffs, has been proved at £6,743 5s.

**The German Emperor** has announced his intention of presenting a statue in bronze of Frederick the Great to the United States, to be erected in Washington on a site selected by the American President. The statue will be a replica in bronze of the marble statue by Professor Schwanthaler, which is in the Berlin Avenue of Victory.

**The Navy League** has received a letter from the Admiralty of Works acknowledging their letter of May 15 on the subject of the Nelson column and the tube railway schemes at Trafalgar Square. The Board state that they are fully alive to the necessity of guarding in every possible way the monument of the column. They will satisfy themselves that the monument is safeguarded before the First Commissioner advises them to give his assent to any Bill.

**An Exhibition** of the objects discovered in the tomb of M. De Morgan is now open in the Grand Palais, Paris, to placing them definitely in the Louvre. One of the objects is a stele of basalt inscribed with the code of the law of Khammourabi, who is supposed to have lived prior to Abraham.

**M. Cognet**, sculptor, delivered a lecture at the Louvre on Friday last on "The Position of Sculpture in the History of Art and of Civilisation."

**The Sanitary Institute** have made an appeal for funds to carry out an extension of Parkes Museum, Margaret Street, in order to adequately represent the many branches of health work. It is estimated that a sum of 25,000*l.* is required for this purpose, towards which about 8,000*l.* has already been raised.

**The First Commissioner of Works** has stated that the amount of the building contracts and arrangements for the Victoria and Albert Museum so far is about 76,000*l.*, of which 52,000*l.* has been spent. The present contract for the building up to the ground floor is to be completed by October next, and will, it is expected, be then finished. The contract for the superstructure of the main building is to be made in the autumn, and will extend over about four years. The penalties under the two principal contracts already made are 35*l.* per week.

**A Collection of Paintings** belonging to the late M. Huybrechts, has been sold in Amsterdam. They realised 975,300 frs. The highest price, 52,000 frs., was obtained for a portrait by Jordaens.

**The Westminster City Council** have decided to purchase workmen's dwellings in Regency Street, comprising 344 dwellings, containing 793 rooms, at an estimated cost, including 32,000*l.* for the land, of 100,200*l.*, and have instructed Messrs. Joseph, Son & Smith, the architects, to proceed with the working drawings. The housing committee estimate the annual income of the buildings to be 3,524*l.*, or sufficient to pay interest at the rate of 3*l.* 10*s.* 4*d.* per cent. per annum.

**The Cases** in the Louvre containing examples of jewels are now all connected with electric bells in such a way that the slightest attempt at tampering with a case is loudly signalled to the conservator's room.

**An Industrial Exhibition** of an international character is to be held in Athens from September to November of the present year. The site selected is close to the Temple of Athena, and the exhibition will be under the patronage of the King of the Hellenes. The general director is M. John Deanwood.

**An Exhibition**, containing 1,700 portraits which have been got together and arranged by Señor Garcia, director of the National Archaeological Museum, in the Palace of the Kings of Madrid, was opened on Tuesday by the King of Spain.

**The Commission** for the statue of the late Lord Nelson, which is to be erected in Windsor, has been given to Mr. Goscombe John, A.R.A. It was originally entrusted to the late Mr. Onslow Ford, who died within a few days of his selection.

**The Court of Common Council** have resolved to purchase a vacant land at the western end of Cheapside by public auction. The site is to be let temporarily for the erection of stands from which to view the Royal Procession in June.

**The Exhibition** of the Royal Cambrian Academy of Art, which has been opened in Conway, and contains an unusually large number of paintings and drawings. The exhibitors are mostly confined to Welshmen. The works seen are mainly landscapes.

**Mr. George Buchanan**, civil engineer, died last week in London. His most important undertaking was the carrying out of the Kimberley water-supply, when he was chief engineer.

**The Foundation-stone** of St. Matthew's Church, Southsea, was laid last Wednesday with full Masonic ceremonies. The architect is Mr. J. S. Micklethwaite, F.S.A., and the church, which is to seat about 1,300, will be Gothic in style. A portion of the church is to be built at first, to accommodate about 800 worshippers.

THE

**Architect and Contract Reporter.****EDITORIAL NOTICES.**

*view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the Workmen's Compensation Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," Imperial Buildings, Ludgate Circus, London, E.C.*

*Editor will be glad to receive from Architects in London and the Provinces results of Competitions and Tenders and other particulars of Works in progress in which they may be interested.*

*authors of signed articles and papers read in public must necessarily be held responsible for their contents.*

*communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.*

*respondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.*

**TENDERS, ETC.**

*As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, Imperial Buildings, Ludgate Circus, London, E.C., not later than 2 P.M. on Thursdays.*

**COMPETITIONS OPEN.**

**CREWE.**—June 12.—Designs are invited for new municipal offices and council chamber. The author of the design which is adjudged best will receive a premium of 50*l.*, and he will be appointed to carry out the design; second premium, 25*l.* Particulars will be supplied by the Borough Surveyor, Municipal Offices, Crewe.

**DEPTFORD.**—Aug. 30.—Competitive designs are invited for a town hall and municipal offices. Premiums of 100*l.*, 75*l.*, and 50*l.* are offered for the three selected designs. Mr. Vivian Chard, town clerk, Municipal Offices, 20 Tanner's Hill, Deptford, S.E.

**HARTSHILL.**—June 16.—The committee of the North Staffordshire infirmary and eye hospital, Hartshill, Stoke-upon-Avon, invite designs for a home for nurses at Hartshill, Stoke-upon-Avon. Particulars may be obtained on application to Mr. Albert E. Boyce, secretary and house governor.

**INDIA.**—Nov. 1.—Competitive designs are invited for the erection of a memorial to Her Majesty the late Queen Victoria at Allahabad. A premium of 2,000 rupees will be awarded to the design selected by the committee. Mr. H. Nelson Wright, Indian Civil Service, honorary secretary, Queen Victoria Memorial Fund Committee, Allahabad, India.

**IRELAND.**—June 2.—The Belfast Harbour Commissioners invite tenders and designs for the decoration and illumination by electricity or otherwise of the harbour office and the south end of the Glasgow shed, Donegall Quay, in connection with the celebration of the coronation of King Edward VII. Mr. G. F. L. Giles, harbour engineer, Harbour Office, Belfast.

**KNARESBOROUGH.**—June 1.—The Harrogate and Knaresborough Joint Isolation Hospital Committee invite competitive designs for an infectious disease (other than smallpox) hospital at Thistle Hill, Knaresborough. Premiums of 100*l.* and 50*l.* are offered for the two selected designs. Mr. J. Turner Taylor, clerk, Municipal Offices, Harrogate.

**LIVERPOOL.**—June 30.—Designs are invited for a cathedral. Three hundred guineas will be paid to each competitor in the second competition, whether his design be accepted or not. The hon. secretaries to the committee are Messrs. R. Alfred Hampson, A. Earle, Os. Penrhyn, and J. W. Willink, Church House, Liverpool.

**LIVERPOOL.**—Sept. 15.—Designs are invited for new labourers' dwellings to accommodate about 2,500 persons, to be erected on the Hornby Street area. Premiums of 250*l.*, 150*l.* and 100*l.* respectively are offered for the first three selected designs. Particulars will be supplied by the Town Clerk.

**SUNDERLAND.**—Aug. 30.—Designs are invited for proposed police and fire-brigade buildings to be erected in Gill Bridge Avenue and Dun Cow Street. Premiums of 100*l.*, 50*l.* and 25*l.* are offered for first, second and third designs respectively. Mr. Fras. M. Bowey, town clerk, Town Hall, Sunderland.

**TOTTENHAM.**—July 15.—Designs are invited for municipal buildings, fire station, public baths, &c. Premiums of 200*l.*, 100*l.* and 50*l.* are offered for the three best designs in order of merit. Mr. W. H. Prescott, surveyor to the Council, Tottenham.

**WEST HARTLEPOOL.**—June 27.—Competitive designs are invited for a new higher-grade school to accommodate 1,200 children, schoolkeeper's house, &c., proposed to be erected in Elwick Road, Eamont and Belmont Gardens, West Hartlepool. Premiums of 75*l.* and 35*l.* respectively. Mr. J. Robson Smith, clerk, School Board Offices, West Hartlepool.

**CONTRACTS OPEN.**

**AXBRIDGE.**—May 26.—For erection of a new infirmary (about sixty beds) on a site adjoining the existing workhouse, Axbridge, Somerset. Mr. A. Powell, engineer, 3 Unity Street, College Green, Bristol.

**BECKENHAM.**—May 26.—For construction of (a) boiler seatings and extension flues; (b) putting-in foundations to alternator; and (c) the erection of disinfectant chamber (35 feet by 12 feet) at the electric light station, Arthur Road. Mr. John A. Angell, surveyor, Beckenham.

**BELMONT.**—May 30.—For erection of a C.E. infants school at Belmont, Durham. Mr. H. T. Gradon, architect, 22 Market Street, Durham.

**BELPER.**—May 29.—For reconstruction of 241 feet lineal of surface water brick culvert 2 feet 6 inch diameter at Kirk Langley. Mr. Robt. C. Cordon surveyor, Hazelwood, Derby.

**BIRKENHEAD.**—June 10.—For erection of a warehouse at Morpeth Dock, Birkenhead, for the Great Western Railway Company. Mr. G. K. Mills, secretary, Paddington Station, W.

**BIRMINGHAM.**—June 2.—For putting-in the foundations and lower storey of the buildings and the installation of a power station at the Birmingham University. Messrs Aston Webb & E. Ingress Bell, architects, 19 Queen Anne's Gate, S.W.

**BIRKDALE.**—June 16.—For erection of a chapel and lodge in the new cemetery, Liverpool Road South, Birkdale. Mr. Albert Schofield, 45 Weld Road, Birkdale.

**FREE TO ARCHITECTS.****A PRACTICAL TREATISE ON****HEATING AND VENTILATING****IN APPLICATION TO THE****STURTEVANT ENGINEERING CO. LD.****1 QUEEN VICTORIA STREET, LONDON.**

**BOOTLE.**—May 27.—For erection of six houses in a new street between Gray Street and Moore Street. Mr. J. Henry Farmer, town clerk, Bootle, Lancs.

**BOSTON.**—June 2.—For additions and alterations to the isolated ward at the fever hospital in Skirbeck, Boston, Lincs. Mr. Jas. Rowell, architect, Borough Offices, Boston.

**BOUGHTON.**—June 9.—For erection of engine and boiler-houses, &c., at Boughton, Notts. Mr. W. B. Starr, architect, 12 St. Peter's Gate, Nottingham.

**BROMLEY.**—For erection of a detached and a pair of semi-detached houses at Kinnaird Park, Bromley, Kent. Mr. W. Prebble, architect, Kinnaird Park, Bromley, Kent.

**BRENTWOOD.**—May 31.—For underpinning a portion of the chapel at the Essex County lunatic asylum. Mr. Frank Whitmore, architect, 17 Duke Street, Chelmsford.

**BURNLEY.**—May 28.—For erection of a Dutch barn. Mr. S. Keighley, architect, 27 Nicholas Street, Burnley.

**BURY.**—For erection of shops, dwelling-houses, &c., in Ainsworth Road, Bury, Lancs. Mr. David Hardman, architect, Agur Street, Bury.

**CANNOCK.**—May 26.—For alterations and enlargement to Rawnsley schools, Cannock, Staffs. Messrs. Bailey & McConnal, architects, Bridge Street, Walsall.

**CANNOCK.**—May 28.—For reconstruction of the bridge over Mitton Brook, on the Penkridge Road, Cannock, Staffs. Mr. Herbert M. Whitehead, surveyor, Penkridge, Staffs.

**CARLOW.**—May 26.—For erection of twenty-seven labourers' cottages. Mr. James Kelly, town clerk, Town Hall, Carlow.

**COVENTRY.**—May 28.—For erection of branch police station, free library and fire station, at Holmsdale Road, Foleshill. Mr. J. E. Swindlehurst, city surveyor, St. Mary's Hall, Coventry.

A BEAUTIFUL three-light stained-glass design by Mr. John P. Seddon, for Compton Martin Church, near Bristol, is now on view in the studio of Mr. Henry G. Murray, 11A Catherine Street, Eaton Square. The subject is the Transfiguration. The colouring, while rich and brilliant, is soft and harmonious, and so judiciously arranged as to transmit a pure white light, a matter of considerable importance in many situations. The glass employed is known as varied antique; it is a specialty of Mr. Murray's, who by its means obtains some admirable light and shade effects.

## TRADE NOTES.

THE Wombwell Urban District Council, Barnsley, Yorks, have ordered a new illuminated turret quarter clock and three bells from Messrs. Wm. Potts & Sons, clock manufacturers, Guildford Street, Leeds, to celebrate the Coronation of His Majesty King Edward VII., which has to be set going on Coronation Day; and the Vicar and Churchwardens of Marton-cum-Grafton, near York, have ordered a hour striking clock and bell for the parish church, also to be set going on Coronation Day.

MRS. BROUGHTON has kindly presented a new clock to the parish church, Bentley, Doncaster, to the memory of her late husband, whose family have resided in the same house opposite to the church for over 200 years. The clock strikes the hours, and shows the time upon two external dials, and was made and fixed by Messrs. Wm. Potts & Sons, clock makers by appointment to H.M. the late Queen Victoria. Messrs. Wm. Potts & Sons have also recently erected a new clock and bell at Ashton Wold, near Oundle, Northamptonshire, for the Right Hon. C. L. Rothschild.

## ELECTRIC NOTES.

AT a meeting of the lighting committee of the Leeds Corporation, the accounts for the year were submitted by the city accountant, and these, after providing for interest and sinking fund charges, showed a surplus of 3,170*l.* 0*s.* 2*d.*

THE E. L. B. system of electric lighting has been adopted by the French naval authorities for the illumination of the special squadron which is on its way to Russia with the President of the Republic. The *Montcalm* in particular has been most elaborately equipped with devices and fittings on the E. L. B. system, the representatives of the Electric Lighting Boards Company also being entrusted with the lighting of the special banqueting saloon and the great dining-tables fitted up on this ship for the entertainment of the Czar. The Czar is personally much interested in the E. L. B. system, and after making some private experiments recently specially ordered it to be applied for decorative purposes at several State functions.

AT the monthly meeting of the Hamilton Town Council the electric-lighting committee reported that the price offered by Messrs. Edmundson, London, the contractors for the lighting of the town, for the generating station at Almada Hill, inclusive of buildings, was 32,302*l.* Mr. Hogarth, their con-

sulting engineer, had reported that, while the price in the circumstances could not be thought unreasonable, it was at least 10 per cent. more than would be required if the Corporation carried out the work themselves. He did not think that better terms could be obtained from any other company. In respect that Messrs. Edmundson had agreed to have the work completed and the light turned on by the end of the year, the committee recommended that the agreement be now completed. After considerable discussion, on the question principally of the site, the report was adopted.

## BUILDING AND BUILDERS.

AT St. James's Restaurant, London, extensive alterations are about to be made according to the designs and under the superintendence of the architect, Mr. Walter Emden.

WE understand that Major Bruton is relinquishing the secretaryship of the Builders' Benevolent Institution owing to failing health.

TENDERS have been invited for the immediate construction of a deep wharf in Quebec Harbour in anticipation of the establishment of a fast Transatlantic line of steamers.

THE corner-stones of an extension of Union Croft Sunday school, Ambler Thorn, were laid on Saturday. The extension is estimated to cost 600*l.*

THE foundation-stones of new parish buildings to be erected in connection with Holy Trinity Church, at the Moir, near Longton, Staffs, were laid on Monday last. These buildings will consist of a Sunday school, a men's institute, a library and a parish-room, and the cost will be about 1,450*l.*

MR. GEORGE GEMMELL, a retired master painter, was knocked down by an electric car at Glasgow last Saturday and removed to hospital, and when Mrs. Gemmell heard the news at her home at Eden Villa, Govan, she was so overcome that she expired. Mr. Gemmell himself has died from his injuries.

THE Troon (N.B.) Town Council has resolved to proceed with the erection of a permanent smallpox hospital, the expenditure to be covered by a loan over a period of thirty years. The site selected is off the old road between Muirhead and Wallacefield, a short distance outside the burgh boundary. The price of the land is at the rate of 12*l.* per acre, and the cost of the building is estimated at 1,400*l.*

# The "ONE" Range.

PATENT 1331/01.

M. F. Co. LD. R.

These Ranges are Exhibited by the following London Firms:—

R. ADAMS, Newington Causeway;

CLARK, HUNT & CO., Shoreditch;

O'BRIEN, THOMAS & CO., Upper Thames Street;

R. H. & J. PEARSON & CO., Ltd., Notting Hill Gate;

ROWNSON, DREW & CO., Queen Victoria Street.

Agents for Liverpool:—

THE WELL FIRE CO., Ltd.

The above shows the heat concentrated under the boiler and the waste heat passing under the hot plate.

This Independent Range is fitted with hot water circulating boiler, as shown in the sections, and the heat of the fire passes direct under the bottom of the oven.

A Fire Brick Dome and damper is fitted over the fire, which enables the heat to be concentrated at pleasure on the hot plate or boiler, the waste heat of either passing under the other, thereby utilising what is usually lost.

The above shows the heat of the fire concentrated on the hot plate and the waste heat passing under the boiler.

The casing and oven door are lined with slag wool and a third oven can be arranged if required.

## VARIETIES.

NEW town hall has been erected at Pwllheli, North Wales, at a cost of 12,500*l.*, and was formally opened last week.

ON Tuesday evening next, the 27th inst., Miss May Morris will read a paper on "Pageantry and the Masque" before the literary art section of the Society of Arts, illustrating her remarks with a series of lantern pictures. The chair will be taken at 8 o'clock by Sir George Birdwood, K.C.I.E., C.S.I., &c.

THE Metropolitan Fire Brigade held a conference last week at the Southwark Bridge Road head-quarters, with a view to considering the steps to be taken in regard to fire protection in connection with the Coronation. It was decided that an action is to be at once undertaken of all Government stands with a view to the removal of every possible risk of fire, and the provision of means of escape in the event of an outbreak. On the day of the procession firemen will be on duty at every alarm post on the line of route, as well as at other points, and other special precautions are being arranged.

HIS Grace the Duke of Northumberland, K.G., vice-president, will preside at the Sanitary Institute Coronation Dinner, to be held on Monday, June 2, at the Midland Grand Hotel. Among those who will be present are:—Sir Joseph Fryer, Bart., K.C.S.I., F.R.S.; Sir Francis Sharp Powell, Bart., M.P.; Sir Samuel E. Scott, Bart., M.P.; Sir William H. Preece, K.C.B.; Sir Henry Norbury, K.C.B., Director-General, Royal Navy; Surgeon-General W. Taylor, C.B., Director-General, Army Medical Service; Mr. E. Barnes, mayor of St. Pancras; and R. M. Hensley, chairman Metropolitan Asylums Board.

THE British Fire Prevention Committee's testing arrangements this month include on Wednesday, May 28, a comparative test between a roof covered with slates and a roof covered with vulcanite. In connection with the ever-increasing loss of life by fire, the Chairman (Mr. Edwin O. Sachs) notified to the National Fire Brigade Union in the course of their successful gathering held last week under the presidency of the Duke of Marlborough, that he was presenting a national silver challenge bowl for the smartest fire-escape crew, to be competed for on similar lines as the Union's existing challenge bowls for steam fire-engines and manuals. Mr. Sachs, who was present with Mr. Farrow, remarked that, although the British Fire Prevention Committee was primarily associated with questions of construction and materials, its members highly appreciated the necessity of advancing in every way the interests of life-saving so gallantly practised by firemen of the country.

## LUXULYAN.

MR. SILVANUS TREVAIL, president of the Society of Architects, has just presented to Luxulyan parish church a peal of bells. The *Western Morning News* contains the following particulars:—

Unexpectedly, Mr. Silvanus Trevail arrived at Luxulyan on Monday from Bodmin in a little pony-trap, and made at once for the fine old parish church. The vicar, the Rev. S. Kendall, had been making a careful survey of the tower and its bells, so that on Mr. Trevail's arrival he was soon put in possession of the facts. There were originally four bells, but of these only two now remain intact, and these, with their framework, mountings and hangings, are in such a state of dilapidation as to be quite unusable. Mr. Trevail was only a few minutes in solving the question. "There must be a peal of six bells, attuned in note or key to the old tenor bell, of which I have the recollections of boyhood. They must be hung and completed with all framework and fittings in the most perfect up-to-date manner, and I will bear all expenses," remarked this very welcome Whit-Monday visitor. Needless to say this announcement almost took the vicar's breath away. For more than half a century Luxulyan had been bemoaning its want of bells. The grand old historic tower that was the repository of the Stannary records before the Civil Wars of the Stuart period, had been for upwards of a century silent, excepting for its powerful tenor bell, although various

incumbents of the parish during that period had done their best to get the peal supplied. These included such earnest and highly respected vicars as the late Rev. Richard Gerveys Grylls, Rev. Cuthbert Edgcumbe Hosken, Rev. Henry Walter Taylor, and later still the present rector of St. Ewe, the Rev. J. Kendall Rashleigh. The district was comparatively poor, and the requisite funds were not forthcoming. But to-day, by the single stroke of a pen, the present incumbent, the Rev. R. Sinclair Kendall, has the great satisfaction of knowing that the bells are assured. Both Mr. Trevail and Mr. Johnston had come down by the night express from London, and the business occupied exactly two hours from the moment of Mr. Trevail's arrival in Luxulyan until he left again by the 1.39 P.M. train, when everything had been settled, even to the signature of the contract, stipulating that the work shall be completed during the month of August next. It is rumoured that this handsome gift is the spontaneous outcome of Mr. Trevail's appreciation of the kind manner in which he and his family were received and treated by the vicar and his old parishioners on the occasion of his late mother's funeral.

### A BRICKLAYERS' MANIFESTO.

THE following statement has appeared in the *Times* :—

Sir,—To allow charges of misconduct, &c., always to pass unchallenged is to risk the chance of allowing the outside public to regard you as guilty, because you refuse to deny or refute them, hence our reason for issuing this manifesto.

Our object in doing so is to place before the public an official reply to the charges made against our members and bricklayers in general. Had the complaints been confined to one or two letters on what is termed the "ca' canny" policy, we should not have considered it necessary to reply; but the systematic way in which false and misleading statements are now being circulated through the Press and otherwise, leading the public into error, has rendered it imperative that we should say something in reply. This then is our excuse for issuing this pronouncement.

As it is impossible in the space at our disposal to reply to all that our detractors urge against us, we must only be considered as dealing with the main arguments put forth and the salient points of their letters; but, before proceeding to do so, allow us to state officially and emphatically that our Society does not recognise nor inculcate, either by rules and laws,

written or unwritten, that it is a sound policy to restrict laying of bricks to any given number per day, but recognises and maintains the right of any employer to discharge any man whom he considers does not do a fair day's work for the wages he is receiving.

That is the principle upon which our Society works, and challenge contradiction. Mr. Stewart, building-manager of British Westinghouse Company, proves that what we say is correct, for he says, "I will say with regard to the unions that if our work has been rapidly executed it has been good due to the interest that has been taken by the representatives of the unions in securing for us the best men that could be obtained."

The controversy regarding "ca' canny" may be said to have broken out in the *Times* during last November in one of their articles in which we find the following very misleading statement:—"Twenty years ago a bricklayer would lay 1,000 bricks a day when on ordinary work. Thirty years ago the bricklayers employed on railway-tunnel work in London laid even 1,200 a day, but the unwritten law now in force declares that a bricklayer engaged even upon ordinary work must 'go easy' and not lay more than 400 in the day." This has evidently been written by someone who is ignorant of the history and practice of the trade. Dealing with the practical part of the question, we have every reason for believing that the "tunnel tigers" are as voracious as ever; and it may be information for those who are interested in this question to know that the men who were in the habit of laying 1,000 bricks per day twenty years ago were men who were paid a penny an hour above the trade-union rate, and where the same policy is adopted to-day similar results would follow. Again Mr. Stewart proves that the statement of the correspondent is false and that our assertions are true. The men who are said to have laid 1,000 bricks per day would be men engaged upon cottages, or work of a rough description, and the same results can be found to-day if the men are paid accordingly.

But, turning for a moment to the historical part of the subject, we find similar complaints being made against bricklayers not doing enough work as far back as 1878 and 1867. Thus it will be seen that this is no new cry, but appears to be one that crops up afresh with each succeeding generation.

Again, to say that the maximum of 400 (or any other number) bricks per day is the "recognised" limit for dwelling

shops, shops and business premises built by a private contractor is a wilful perversion of facts, as no such maximum exists anywhere but in the heads of confused and irresponsible agitators.

leaving the *Times'* correspondent now, and passing on to consideration of the views of another, we might say, by the way, that we would gladly welcome criticism and discussion from any architect who can state his case with courtesy, but when he stoops to be insolent and impertinent we can afford to ignore him, no matter how many initials he may be able to add to his name.

Americans are always conspicuous for doing things smarter and more ingeniously than anyone else; and the building at Ford Park, Manchester, is no exception to the rule.

It appears that Mr. Stewart, the building manager for the British Westinghouse Company, has submitted to the *Times* some figures relative to bricklayers' work which have called forth a whirlwind of criticism from a number of persons who evidently do not understand the trade. The mere fact that high averages may be reached on a certain class of work is no proof that they can be reached on other classes of work, and this is apparently what some of our critics fail to realise. That a great number of bricks would be laid each day we are prepared to admit; the quality of the work, the state in which it has been left for finishing, the absence of arches, pilasters, &c., which necessitate devoting of much time to plumbing, levelling, &c., all favour high speed and good records, but we hope we will be pardoned when we decline to accept Mr. Stewart's figures as absolutely correct. Notwithstanding Mr. Stewart's assurance, we decline to believe that the bricklayers working on the chimney at Birkenhead laid upon an average 1,976 bricks per diem. To have reached any such average would mean that the chimney would have to be scamped to such an extent as would endanger its stability.

But before leaving this question of high averages, and before taking leave of the subject, we would like to draw the attention of those interested in the question to one or two points in the matter that must always be considered by those who wish to have correct ideas concerning quality and its bearing on speed. First of all, when people make comparisons between the amount of work done for the Westinghouse Company and that of the contractors, it ought to be remembered that the Westinghouse Company were building for themselves, had only themselves to please concerning the quality and finish of their work. Not so with the contractors, who

in most cases have to satisfy their client, the architect, and the clerk of the works; and no architect or clerk of works would allow a contractor to finish his work in the fashion that is necessary for attaining high rates of speed. As an evidence of our desire to be just in this controversy, we challenge any architect of position or any clerk of works who has had a few years' experience in the erection of brick buildings to say that the class of work which can be secured by high rates of speed, no matter how well paid for they may be, is the class of work they are prepared to accept. Any impartial observer will see clearly what class of work the Westinghouse Company were turning out when he finds the *Times'* correspondent saying, "It must be remembered, however, in regard to this question, that there is a great difference in the quality of bricklaying. What is good enough for rough work out of sight will not do for the front of high-class dwellings, not to speak of such refinements as rubbed bricks." This leaves the practical man with no room for doubt regarding the quality of the work, but he is also aware that the architect and clerk of works would not allow speed to be procured by any such methods; therefore it is grossly unfair to make a comparison of men who are employed under conditions so dissimilar. Again we would say that we recognise the right of employers to demand a fair day's work for a fair day's wage, but to cite such cases as Mr. Stewart and the *Times* correspondent have favoured us with is to disappoint employers, dishearten the men, and destroy the very object they seek to secure.

G. W. HOPE, President.

JOHN HARRISON, Secretary.

Operative Bricklayers' Society, Newcastle-on-Tyne.

#### LIABILITY OF SUB-CONTRACTORS.

JUDGMENT was given on Friday, the 16th inst., in the House of Lords, in the appeal case *Cooper & Crane v. Wright*.

The appellants, Messrs. Cooper & Crane, builders, Nottingham, contracted to erect a building at Nottingham, and afterwards contracted with the respondent, Alfred Wright, a slater, to provide the slates for the roof of the building, and "to fix the same." On June 29, 1899, while the building was in course of construction, James Arthur Brady, a slater's labourer, employed among others by the respondent, received in the course of his employment injuries which resulted in his death, a lift or hoist by which he was conveying slates to the roof

having collapsed. Steps being taken by the widow to obtain compensation under the Workmen's Compensation Act, 1897, the appellants denied liability, on the ground that Brady was not immediately employed by them, but by the respondent in the execution of work which was no part of the business carried on by them, and alternatively contended that they were entitled to be indemnified by the respondent should any compensation be awarded against them. The respondent contended that he was not the "undertaker" of any work to which the Act applied. An arbitration was heard by the Nottingham County Court judge, who ordered the appellants to pay 217*l.* to the dependents of Brady, but by a later award determined that the respondent was liable to indemnify the appellants. The respondent appealed, and the Court of Appeal set aside the decision of the County Court judge as to his being liable; and against the order pronounced by the Court of Appeal Messrs. Cooper & Crane appealed to their Lordships' House.

Lord Brampton, in the course of an elaborate judgment, said that the widow was entitled to compensation from Cooper & Crane as the undertakers admitted of no possible doubt. The judge was right, therefore, in his award of compensation against them. Even had this been open to question, no appeal had been made against it, and that award was not questioned during the argument and need not now be questioned. The real question before their lordships arose out of the question of Cooper & Crane for indemnity from their sub-contractor Wright. The case in support of that claim was put thus, that by his sub-contract with Cooper & Crane Wright became an undertaker equally with themselves within the meaning of the 7th section, and was in every respect under the same primary obligation to pay compensation to the widow, and that such liability was a liability imposed by sections 1 and 7 independently of the 4th section, so as to bring him within the proviso of that section and to give them a right to claim indemnity from him. He did not think those propositions could be maintained. First, Wright was not an undertaker within the meaning of section 7 of the Act. It might be that in the ordinary common acceptance of the expression a man might be said to undertake anything he had taken upon himself to do with or without a contract, but that was not the interpretation contemplated by the framer of the definition clause. The

legislature in using the expression "the undertakers," had given it a limited statutory meaning beyond which it could not be extended. To bring any person within the definition clause he must have undertaken some definite specific work of construction which was to form the subject of his undertaking. In this case it was for the construction of an entire building. For such a work it seemed to him that two persons, or several persons only, could fill the position of undertakers defined by the Act—the building owner who took upon himself the construction of the building, or the persons who, through the medium of a contract with him, took upon themselves the obligation to execute the work for him. By their contract Cooper & Crane undertook the construction of the building from the foundation to the roof, and therefore they constituted themselves the undertakers of the whole building within the definition of section 7. If undertakers could add to the number by sub-contracts for different parts of the building, there would be no limit to their number, and this would greatly tend to defeat the object of the legislature in its endeavour to assist the workman by pointing out specifically the persons to whom he might look for compensation. He could conceive none on whom the obligation to pay compensation could more reasonably rest than those who, as a matter of business, had undertaken the whole control and every responsibility attaching to the erection of the building they had undertaken to construct. The language of section 4 indicated a thorough appreciation by the legislature of the difference between undertakers to whom the Act applied and a sub-contractor for a part of the work. The Act never spoke of sub-contractors as undertakers, and if it had been intended they should be so considered with all their obligations, it was impossible to suppose it would not have imposed these obligations and expressed such intention in clear, intelligible language. He was satisfied that the Act by no reasonable interpretation could be held to make a sub-contractor an undertaker, and if he was right in that view this appeal must fail. But even if Wright could be considered such an undertaker with an obligation equal to that of Cooper & Crane to pay compensation, he failed to see upon what ground the claim of Cooper & Crane for indemnity could be supported in this case. The common law certainly would not enable one or two

## "TAYLOR'S PATENT JUNCTION"

No. 12662.

For WATER CLOSETS, WATER PIPES, ANTI-SYPHON PIPES, &c.

APPROVED BY ALL SANITARY AUTHORITIES.

THIS Junction has been invented with a view to enable anyone fixing closets overcoming the difficulty of the many angles required for the various makes, also to avoid the necessity of having joints inside the walls, which are dangerous and not allowed by County Councils, Borough Engineers, Architects, &c. The 4 inch Junction can be adapted to any size from 4 inch downwards. Any plumber will see at a glance the great convenience of this article, as it only requires one junction for the many shapes and sizes. No Brass Thimbles or Calking required. A perfect Gas and Watertight Joint can be made in a few minutes by any ordinary Plumber. In fixing this Joint, all that is necessary is to cut the Lead Pipe to the required angle, place on the loose Iron Flange, then flange back the Lead Pipe  $\frac{1}{2}$  inch all round, coat the face of Flange with a little Red Lead Putty, bring the two Faces together and draw up with the Bolts, screwing up each Bolt a little at a time until they are all tight, then the Joint is made and will stand any test. Another great convenience is:—In case of any alterations or renewal of Soil Pipes, all that is required where this Junction is used is to unbolt the same, and the Closet and Pipe leading to it are left intact. With all other Junctions it is necessary to take down the W.C., break open the wall, damaging the Property and causing other inconvenience.

A—Is the front view of Junction and loose flange; the inlet being elongated, allows the lead pipe to be cut to any required angle.

B—Shows the Joint fixed and ready for tightening up, and also a few of the angles which can be got.

C—Shows the one size which can be adapted for 4 in. Soil Pipe, and a 4 in.  $\times$  1 $\frac{1}{2}$  in. Invert Junction for Anti-siphon Pipes, &c.

D—Shows how to arrange for a small sized branch.

Made in Three Strengths—Ordinary Rain Water,  $\frac{1}{2}$  and  $\frac{3}{4}$  Metal.

PRICES AND PARTICULARS CAN BE HAD AT ALL WHOLESALE MERCHANTS, OR FROM

CHARLES TAYLOR, R.P., Sanitary Engineer, ECCLES, MANCHESTER.

is, each equally liable to pay statutory compensation to a man, who had paid such compensation in full, to obtain indemnity against the other for the whole amount so paid. To such a claim some enactment by statute or some contract between the parties would be necessary. No such enactment had been shown in this case. There was not bound in the Act anything, expressive or implied, creating, a possible event of there being two or more undertakers, being equally liable to compensation and neither guilty of negligence, an obligation of indemnity in the event of one only of them being called upon to pay. But he would put out another objection to the claims of indemnity. The Act in section 4 was that "the undertakers should be liable to be indemnified by any other person who would have been liable independently of this section." Now, if it could be said that Wright was one of the undefined undertakers mentioned in that section, and that there was a common obligation as undertaker upon Cooper & Crane and Wright, would it be said that Wright was some person other than an undertaker? Treating him as a mere sub-contractor, this obligation would not arise. In his opinion, Cooper & Crane were the only undertakers within the definition of section 7 of the Act. They admitted the award was right, and the burden must rest where it had fallen. If undertakers desired to shift the responsibility of an indemnity upon their sub-contractors they must provide for it in their sub-contracts. It was held that, in his opinion, the appeal ought to be dismissed with costs.

Lord Robertson said he agreed with Lord Brampton. The Lord Chancellor said:—In this case a building was constructed for Messrs. Barker & Co. by Messrs. Cooper & Crane, as builders. Messrs. Cooper & Crane contracted with the respondent Wright to supply slates for the roof and to perform the work of completing the roof. Wright, in his turn, employed a labourer named Brady to carry the slates, and in the course of that employment a lift broke and caused Brady's injuries. It is not denied that under the express language of the statute Brady's representatives were entitled to compensation from Messrs. Cooper & Crane. They were the persons constructing the entire building, but they had obtained a sub-contractor to construct the roof. No question, therefore, is raised but that this is an employment to which the Act applies. To get out for the moment of the technical language of the statute, the substance of the matter would appear to be that Barker was the person for whom the building was being

erected, Messrs. Cooper & Crane were the persons who contracted to build it, Wright was the sub-contractor for the roof, and Brady was employed by Wright, who was Brady's actual employer. Now, it appears to me that the general design of the statute was to enable an injured workman, or, in the event of his death, his representative, to make a claim for damages against the employer in the sense of a person who was constructing the building—even if he was not the immediate employer of the person injured. The theory of the Act is, apart from any negligence or misconduct, that a man employed in certain dangerous employments shall be in a certain sense insured against any accident that takes place. It was probably obvious to the legislature that if the workman was driven to sue a sub-contractor and could not rely upon the responsibility of the person engaged to perform the whole work, a series of sub-contracts might render it practically impossible for him to ascertain the person whom he ought to sue, or, if he did, to obtain satisfaction. But then the legislature seems to have provided that, though the contractor for the whole work might be sued even by a person not immediately under his control or in his employment, yet the theory of the statute being that the employer was to be made liable, the contractor for the whole work might procure his indemnity for the liability against the actual employer of the injured workman. Now here, of course, it cannot be denied that Wright is the actual employer, and if the design of the statute is what I have suggested, it is clear that Messrs. Cooper & Crane, who did not employ Brady at all, and are only made liable by the statute in the first instance—and the statute saves their right of indemnity against the real employer—the case is one actually contemplated by the statute, and so the County Court judge decided. The objections appear to be that Wright was not an undertaker at all. That, in a popular sense, he undertook the construction of the roof is admitted, that he employed Brady is admitted, that the accident happened in the course of Brady's employment under Wright in the construction of the building is also admitted, and the question is whether there is anything in the statute to show that Wright cannot be within the meaning of the statute itself an undertaker. The whole point seems to turn upon the question whether the persons who are described as undertakers must be undertakers of the whole construction, and I suppose that argument turns upon the word "the," because the interpretation section enacts that in the case of a building the undertaker means the person undertaking the construction,

repair or demolition. If by that is meant that, in order to be an undertaker, the person must have undertaken the construction of the entire building, it would be an intelligible construction, though it is not the one that I would place upon the section, but if, as the Court of Appeal seems to have held, an undertaker does include a person who sub-contracts for a substantial part of a building, then I do not understand why in this case Wright was not an undertaker. By any of the ordinary particulars by which an undertaker can be described, Wright was certainly an undertaker. He undertook a substantial part of the work, namely, the roof. He had the control and management of that part of the work. He employed Brady as a labourer in that form of employment, and I do not understand why it is suggested that he was not an undertaker, unless it is suggested that, in order to be an undertaker, he must take upon himself the entire contract that has been made by another person. It seems to me that would be an unreasonable construction of the statute, which in its language is sufficiently clear. To apply therefore the language of the statute itself to the facts of this case, the employment here of Cooper & Crane was an undertaking by them, and they are in their turn undertakers, but they contracted with Wright for the execution of certain work, namely, the roof. But by the language of the statute they are made liable if such work were executed by workmen not immediately employed by them, but on the work for which they contracted; they must pay compensation under the Act to those workmen in respect of any accident arising out of and in the course of such employment. That is the liability imposed upon Cooper & Crane, nor have they denied their liability or appealed against the judgment. But, while providing that the building contractor shall be liable, the section goes on to provide that they are entitled to be indemnified by any other person who would have been liable independently of that section. Observe, it is not independent of the statute, but this section. Whether the enactment is felicitously worded or not, when one looks at the section and the proviso together, I think it can hardly be doubted that the meaning of it was that where part of the work is let out, although the builder of the entire structure shall, in the first instance, be liable for injury to the workmen employed by the sub-contractor, nevertheless he is not the actual employer. The builders who are thus made liable for injuries to a workman not employed by them shall have a right of indemnity against the actual employer, between whom and themselves there was no relation ex-

cept that of contractors. I doubt whether the attempted definition of the word "undertaker" has added anything to the interpretation of the statute. Cooper & Crane undertook the whole building; Wright undertakes the construction of the roof. It is in the course of the construction of the roof that Wright's labourer is injured, and if it is contended that the latter words of section 4 do not apply, this consequence would follow—that Wright, apart from that section, would not be liable to Brady, although Brady was employed by him and was engaged in a building operation, and, if that argument is right inasmuch as apart from that section Cooper & Crane would not be liable at all, the workman would have no remedy whatever, so that, though Wright should be employing a man in a trade considered dangerous by the Act, and though in the course of that employment Wright's labourer was injured, the labourer would have no remedy. It seems to me that this would reduce the legislation to an absurdity, and I cannot think that the legislature could have intended such a result. Put this case. Suppose there was one who undertook the construction of the whole building. The owner is not in any case the undertaker. If the different contractors undertook to construct each a different part of the building there would be no person who undertook the whole building. Then suppose this very accident occurs—who is liable? No one if the objection is a good one, and yet one of the contractors would be an employer of a man who by this hypothesis is engaged in a work the statute has regarded as dangerous, yet he would have no remedy. I think this cannot have been intended. I am not quite certain what is meant by my noble friend Lord Brampton when he used the phrase "the building owner." I do not understand whether he means a person who means to have a building built for him or a person who himself undertakes the actual construction. I agree the Act does not apply to a man who takes no such part at all, but by four or five different contracts places out the building to four or five different builders. If he did this, there would be no undertaker and no compensation. This seems to me to show that looking at the whole purview of the section in question, it cannot have been intended. In these circumstances, I think the judgment of the Court of Appeal is wrong and I move that it be reversed.

Lord Shand and Lord Davey concurred.

The appeal was allowed, the judgment of the Court of Appeal was reversed, and the order of the County Court judge restored.

## INSTITUTE OF CLAYWORKERS.

Annual dinner of the Institute of Clayworkers was held on Tuesday evening, the 14th inst., at the Holborn Restaurant, where some seventy clayworkers, representing the brick, tile and pottery industry in all parts of the country were present. Mr. B. Broad occupied the chair. After the loyal address had been given "The Architectural Profession" was discussed by Mr. W. B. Hughes, and replied to by Mr. J. H. Trevel, president of the Society of Architects. "The Institute of Clayworkers" was proposed by Mr. Broad, and seconded by Mr. E. P. Collier, J.P. (who is the president for the year), and Mr. H. Greville Montgomery, hon. secretary. A toast of "The Visitors" was proposed by Mr. Webster and replied to by Mr. Ellis Marsland, Master of the Worshipful Masters and Tilers' Company.

A party of clayworkers numbering some fifty members went on an annual excursion, Paris being fixed upon for this year. On the 16th inst. the members paid a visit to the National Porcelain Manufactory of Sèvres, and during the day they were officially received by the Union Céramique of France, and a banquet given in their honour.

## MALLEABLE GLASS.

According to the *Kansas Mail*, a report comes from Muncie, Ind., that Mr. Louis Kauffeld now seems to have discovered the long-lost art of making what is known as malleable glass. For five years Mr. Kauffeld has been attempting to ferret out the mysterious elements. He is a lamp-chimney worker, and his effort is to get a lamp-chimney that will stand excessive heat and then not break when coming in contact with water when heated. Kauffeld dipped almost red-hot chimneys in water that was ice-cold, and they were not affected, while the ordinary glass would have been shattered. Heavy glass bottles were filled with ice-cold water, placed in the fire and the water boiled out, while the bottle was not harmed. This process makes cooking vessels possible out of glass, and to a great extent the glass can be used in the manufacture of machinery. Mr. Kauffeld claims, further, that he can weld the glass together like a blacksmith with iron. Many glass men were startled at the success. This will open up possibilities in architectural and mechanical construction that at present can hardly be appreciated.

## CITY AND GUILDS OF LONDON INSTITUTE.

THE annual report of the Council of the City and Guilds of London Institute states that the Institute has recently received from the University of London an offer to devote 1,425 $\frac{1}{2}$  a year to the department of engineering in the Central Technical College, which has become a school of the University, subject to certain conditions. This amount is the larger part of a grant made to the University by the London County Council for improving and extending the teaching of engineering in London. It involves the appointment of the professor of engineering of the college as a "transferred teacher" of the University, and "it is a recognition by the University that the college occupies the foremost position among engineering colleges in the Metropolis." One of the conditions on which the grant is offered to the Institute is that it shall be used for extending the work of the college. The Institute has expressed its readiness to accept the proposal subject to some limitations imposed upon it by its constitution. The report refers to the extension of the Central Technical College for the electrical and engineering departments, the total cost of which, including equipment and all structural additions and alterations both for the college and the department of technology, is estimated at 10,000 $\frac{1}{2}$ , and the additional annual cost at about 1,000 $\frac{1}{2}$ . The latter amount has already been almost realised by increased receipts from students' fees during last year. The executive committee have approved a regulation under which a student who has obtained the diploma of Associate of the Institute may devote a fourth year at the college to more advanced study and research in his department. In order to give advanced students as much knowledge of workshop, book-keeping and accounts as will enable them to understand and to devise a system adapted to the requirements of the works in which they may be engaged, the subject has been included as a part of the diploma courses in civil and mechanical and electrical engineering, and a lecturer in the subject has been appointed. The number of students under instruction in each department during the last two complete sessions was as follows:—Mathematics and mechanics, 233, as against 228 in the previous year; civil and mechanical engineering, 233, the same as in the previous year; electrical engineering, 239, as against 237; and chemistry, 244, as against 234. With reference to the Technical College, Finsbury, the work of which is carried on in three places, the report states that the whole subject of the future of the college is

# Easton's

# Express

# Electric

# Lifts.

ROAD SANCTUARY CHAMBERS,

WESTMINSTER, S.W.

receiving consideration, and in the meantime steps are being taken to obtain an estimate of the probable cost of adding to the present building, with the view of bringing all the work under one roof. The number of day students in the college in 1900-01 was 187, against 200 in the previous year; and the evening department was attended by 592 students, as against 639 in the preceding session. The Council state that the work of the South London Technical Art School has been continued with the same success as in previous years. With reference to the age limit which the Royal Academy has placed on the admission of students to their school, and which has had the effect of excluding all the Institute's best students from the Academy studentships, the report states that before the imposition of the limit, the gold medal and travelling studentship of 200*l.* of the Academy was won on four successive occasions by students of the South London school, three of whom have since been elected associates of the Academy, and one, Mr. G. Frampton, has just been elected an academician. In order to counteract the discouraging effect of this limitation of age the Institute has offered annually for competition among the students of the school a studentship to enable the holders to devote two years to further study.

In the department of technology there has been a further development during the past session. In the different branches of technology 2,222 classes were registered last year, and the number of students in attendance was 34,246. This year the number of students exceeds 36,000, and in addition there are nearly 2,000 students in the manual training classes, making a total of over 38,000 students in the classes affiliated to the Institute. The development of technological instruction in the several technical schools throughout the country has brought into prominence the question whether in the assessment of grants some recognition might be given not only to the teaching of science and art, but also to the teaching of the application of science and art to particular trade subjects. The value of the Institute's certificate lies in the evidence it affords that the holder of it has received sound and efficient teaching in the principles as well as in the practice of his craft. The Council say it is gratifying to the Institute to know that the heads of public departments and manufacturers now offer in different ways inducements to persons in their employ to present themselves for the Institute's examinations, and that in many subjects the technological certificate has a distinct value of its own. The income of the Institute for the past year amounted to 35,586*l.*, made up of subscriptions and donations

22,196*l.* and school fees and sundry amounts received from students for materials, &c., 13,390*l.* The total expenditure was 33,041*l.*

### EDINBURGH MERCHANT COMPANY'S NEW PREMISES.

THE extended premises of the Edinburgh Merchant Company were opened by Lord Balfour of Burleigh yesterday. The company, says the *Scotsman*, has long been hampered in its present premises in Hanover Street, and when opportunity arose for acquiring the adjoining buildings belonging to Messrs. Menzies & Co., it was taken advantage of. It was recognised that if extensions were to be made the opportunity likely to occur had arrived, as the existing offices were enclosed on three sides by public thoroughfares, and expansion could only take place on the southern boundary. Accordingly after some negotiations, the property was purchased at a price of 26,500*l.*, which, as the old buildings on the ground were worn out and useless, became practically the price for the site. After serious consideration it was decided, as the north half of the structure already represented the uncompleted portion of a design, to duplicate this wing on the south, thus completing a harmonious architectural façade of 90 feet in length. As the frontage to Rose Street measures 100 feet, the total area occupied by the buildings is about 1,000 square yards in extent. The company selected Mr. Thomas P. Marwick, York Place, as their adviser and architect for the new buildings, and from his plans and under his general supervision during the last twelve months the new additions have been satisfactorily completed, with the aid of the various officials of the company and of the building committee, which consisted of the master, Mr. John Cowan; the treasurer, Mr. John Harrison; the old master, Mr. Robert Weir; the past-master, Mr. W. W. Robertson, of His Majesty's Board of Works; Mr. G. Washington Brown, R.S.A.; Mr. John Lowrie, Mr. James Anderson and Mr. James Kennedy. The premises being too extensive for the present uses of the company, arrangements were made with the North of Scotland Bank, Ltd., the Carnegie Trust and the Edinburgh Chamber of Commerce to lease a portion of the new accommodation. The part occupied by the bank, which has been already opened for business in view of the Whitsunday term, although the apartments are not finished, is the ground and basement floors

### MAY-OATWAY FIRE ALARM.

Since the recent practical test of this system at Ilford, bookings have been very heavy.

Dingle Station, the scene of the late fatal fire, is now protected by the May-Oatway Fire System and connected direct with the Liverpool Fire Brigade.

The Manchester-with-Chorlton Guardians have contracted with the MAY-OATWAY FIRE APPLIANCES, LTD., to protect their Work-house from fire.

No person need risk life or property by fire. The MAY-OATWAY automatic bedroom indicator will show on retiring that the house is safe, and wake you immediately and indicate its position when a fire breaks out.

with wing. Access is obtained to these by a short flight of stairs, over which is a portico supported on four fluted columns and surmounted by a sculptured pediment of appropriate character. The accommodation available for the Merchant Company consists, firstly, of the addition of wings to the large centre meeting-hall of the members. These wings measure each about 31 feet by 12 feet. This addition to the company's hall gave rise to considerable diversity. The hall is a very elegantly designed apartment, of a central square about 31 feet by 31 feet inside the walls and surmounted by a coffered dome of 37 feet high above the floor level. The difference amongst the members as to whether or not the coupled columns which separated the east wing from the central area should be duplicated at the north and south wings, or whether these new wings should be unobstructed, so as to increase the available floorage. It was ultimately arranged that the pillars should be put in to preserve the architectural beauty of the interior, but they should be of wood, and that massive steel girders should be placed over the north and south recesses to harmonise the recess on the west side, and so that the pillars could be removed if at any subsequent time it was thought advisable to do so. The lower portion of the dome over this hall is 6 inches in diameter. Immediately over the columns is a complete entablature, surmounted by ornamental scrolls, subdivided and enriched by figures. The remainder of the accommodation on the ground floor of the old building is occupied by the chamberlain and his staff and the medical officer's room. On the first floor of the new wing there has been added a board-room measuring 30 feet by 20 feet, with a large oriel window to the front street. This room has a decorative ceiling, and is finished with floor and panelling of dark polished mahogany. The table and furnishings have been specially made, and an electric fan and fresh-air supply have been provided for the frequent renewal of the atmosphere. The remainder of the first floor of both wings is occupied by the secretary and law agent of the company and his staff, the superintendent of works and the officer in charge of cloak-rooms, lavatories and other accommodation of like character. The premises to be occupied by the Mortgage Trust are a series of four apartments on the second floor containing an area of about 1,630 square feet, and arranged in a plain and simple manner to harmonise with the other rooms on this flat. There is also a board-room for the Chamber of Commerce. In the attic flat has been placed the

caretaker's residence. A number of minor improvements on the old building have been carried out. The stair giving access to the upper floors was a very steep and inconvenient one. That has been removed, and a much better one with a massive oak balustrade has been substituted. An electric elevator has also been inserted to afford easy communication between the flats. The car is of oak with various coloured metal and wood inlays, and surrounded by a hammered copper frieze containing the monogram and coat-of-arms of the company. The whole premises have been constructed in a very substantial manner with steelwork and fire-resisting concrete floors. The ventilation is by fans driven electrically. There is an electric-light installation with specially designed fittings, and a hot-water heating system. The total outlay, inclusive of the site and furnishings, will be about 46,500*l.* The dominant idea has been to carry out the work in a simple and substantial manner, having both the exterior and interior designed in harmony with the portion of the building which had previously been in existence. The additions having been completed within a very restricted time are not yet decorated, and this will probably not now be undertaken for another year.

### GARDEN CITIES.

UNDER the auspices of the newly-formed Liverpool branch of the Garden City Association a conference was held at Common Hall, Hackins Hey. Mr. W. H. Lever, J.P. (Port Sunlight), presided. There was a good attendance. The Chairman explained that it was their object to improve the lives of the people on the lines of the Garden City Association, to spread the houses over the land so as to allow for gardens in front of the houses and vegetable gardens behind. One of the most pleasing sights at Port Sunlight was to see the dwellers getting their recreation in gardening. He agreed, however, that garden cities could not be built at the present day, as the building by-laws existed, as a commercial undertaking. The by-law, he held, could be modified. He knew that corporations, including Liverpool, were spending large sums of money with regard to the housing of the people. He suggested that something might be done towards a solution of the problem if the Corporation of Liverpool, instead of building large tenement houses, were to acquire land on the outskirts of the city and have the courage to say to the builders, "We have got the land here. If you will build upon it you can

have it for nothing for the purpose only of erecting houses at rentals specified by us." The Corporation would retain their power over the land and could make special conditions for manufacturers to build there. In future large tenements in the city would be condemned, he thought, because a system would be developed of building houses outside the city, so as to take the people back to the land. The idea that all this would entail great expense on the rates was merely imaginary. He contended that the Corporation could purchase land beyond the tramway service at prices from 100*l.* to 200*l.* per acre. He would limit houses built on such land at ten per acre. These, at the rateable value of 15*l.* each, would yield 150*l.* per year. Fixing the rates at 5*s.* in the pound, this would realise 37*l.* 10*s.* per year. In the ten houses fifty people could be accommodated, and he ventured to say that the Liverpool Corporation, to accommodate that number of people under present circumstances, would have to lay out a capital expenditure of 3,000*l.*, whereas an expenditure of 200*l.* would secure an ample return and a relief to the rates.

Mr. Thomas Adams (general secretary of the Association) said that the Garden City Association felt that some immediate action should be taken to secure some economic means of solving the housing problem. He described the objects of the Association and the way the members intended to set to work, and said they had formed a liability company with the intention of securing a site to carry out their proposed scheme.

A resolution was passed to the effect that the meeting support the Garden City Association in the endeavour to solve the housing problem on lines so as to provide for the individual and social needs of the people on new areas, with the co-operation of manufacturers and others.

### BIRMINGHAM ROWTON HOUSES.

A MEETING of the shareholders in the Birmingham Rowton Houses, Ltd., was held on the 14th inst. Mr. Moore Bayley said the Board had received applications for at least 39,500*l.* in shares. The first point upon which the company might congratulate themselves was the acquisition of a site in Alcester Street and Moseley Street, and fronting on Highgate Park. It would be impossible to improve upon this site, which the Board had been able to obtain, thanks to the generosity of the owners, at a very fair and reasonable price. The site was

central, and particularly suited by its measurements for a house of the character proposed, while it had an extensive front on Highgate Park, thus securing the light and air worth thousands of pounds could not have obtained elsewhere. In the prospectus they had stated that they wished to build a house to accommodate 600 men per night, but after going carefully into the matter they had decided to go further and build a house for at least 800. The erection of the smaller house would cost 46,000*l.*, and the larger one 8,000*l.* more. Lord Rowton had implored them not to be content with smaller, but to go in for the larger, which would mean as financial success. It would be just as easy to fill the house with 800 as 600, and he (the Chairman) felt sure they would soon regret that they had not made the accommodation 1,000. On a house of 600 men they would make a net profit of 1,800*l.* per annum, but on the 800 house the profit would be 3,100*l.* The staff would need to be increased by only one man, and an increase in expenditure would be only 500*l.* a year. Such figures deserved the most careful consideration. On the house for 600 men they would be just able to pay 2½ per cent. their capital, whereas on the larger house they could pay 4 per cent., and carry forward 500*l.* a year to the good. He believed in the bold policy. The Board were going in for the big house, and he did not think they would be disappointed.

The architect (Mr. H. B. Measures), being invited to address the shareholders, said that the Highgate Park site struck him at once as being ideal for the purpose of a Rowton House. A house for 600 men would cost more in proportion than one for 800, and when it came to administration practically the same staff would be required. He had visited the district in which the house would be situated, and he believed that such an institution as it was proposed to erect would attract not only the frequenters of the common lodging-houses but the young-men-lodger type, who were at present occupying rooms where the children of the family should be, and who would not go into common lodging-houses. It would be a wicked waste of a good site not to build a house for 800 men at Highgate Park.

The architect's plans were exhibited. The building would cover an area of 4,320 yards, and have an elevation overlooking Highgate Park in red facing bricks, relieved with pinky-buff bricks and dressings of pinky-buff terra-cotta. The frontage to Alcester Street will be similarly decorated, and in the centre of this frontage will be situated the main entrance to the establishment. Advantage has been taken of the large area

to place all the day-rooms used by lodgers (except the smoking and writing-rooms) on the ground floor, as the superintendent's and catering department. For administrative purposes the building will be divided into five sections, namely, superintendent's apartment, bed makers, erg section (which includes sleeping accommodation for employed in shop, kitchen and scullery), lodgers' day and lodgers' cubicles. The portion of the ground floor Highgate Park will be occupied by the catering department, with sitting-room and bedrooms for the female adjoining the kitchen. Complete arrangements will be made for the preparation and sale of cooked or uncooked foods, or for the sale of foods to those lodgers who may prefer to cook their own, and the catering probably be carried out by the company's staff. Entrances to the lodgers' day-rooms and corridors are to be glazed brickwork from floor to ceiling, the dado being in green and chocolate, and the upper portion in ivory glazed.

In the central courtyard will be situated the dining-room, providing seating accommodation for 448, whilst a large number of extra seats and wooden easy chairs will also be provided. A shop planned with teak front will open into the dining-rooms and will be stocked with goods to meet the varied requirements of the lodgers. A large space on the frontage to the street will be divided up into thirteen corridors fitted with lockers, arranged in tiers, and adapted for receiving sticks and umbrellas. A barber's shop, lavatories, bath and dressing-room, and washhouse will also be provided, together with makers' and tailors' workshops. A large smoking-room, with three fireplaces and wooden easy chairs, will overlook Highgate Park from the first floor, and next to it will be placed a dining-room with seats and tables for over 170 men. The building will be approached by three fireproof staircases, the position of which will make it impossible for the lodgers to be trapped by fire, seeing that the corridors are to run from the staircase. In addition, each floor will be divided into eleven erections, which would check, if not stop, the progress of a fire in a horizontal direction. The division of floors also permits of isolation and efficient fumigation in case of infectious disease occur in the building. Each floor will contain sleeping accommodation for officials, who will be enabled by a special system of lighting to have control over the cubicles. For the accommodation and advantages referred to lodgers will be asked to pay the small sum of 6s. per night.

## THE DANGER OF CASTING.

ON April 9 there was an outbreak of molten metal at a casting operation at the Don Foundry, Attercliffe, Sheffield. Several of the men were seriously injured, and five of them afterwards died. The cause of the accident was not apparent, and in order that a scientific investigation might take place, on the 14th inst. the inquest was resumed. Professor Arnold, of the Sheffield University College, was asked as professor of metallurgy to make a full inquiry at the instance of Mr. John Fowler, the principal owner of the foundry. The Professor attended and presented the following report:—

On April 12 I inspected the foundry, in which, after the accident, everything had been left in situ. I interviewed Mr. Fowler and his manager, Mr. Smith. I subsequently saw the roll as removed from the casting pit. I also interviewed Mr. Simmonite, one of the workmen who arranged the ballasting of the core tube, and, finally, in your presence at the infirmary I saw Mr. Barker, the foundry foreman.

Mr. Fowler supplied me with a sectional drawing of the arrangement of the mould, a drawing of the core tube after the accident, and also with a bag of composition similar to that with which the core tube was rammed.

The analysis of this composition, after thorough drying at the temperature of a foundry stove (namely, about 220° C. or 430° F.) is approximately as follows:—Red sand 79, charcoal 15, coal dust 5, yellow clay  $\frac{1}{2}$ , sawdust  $\frac{1}{2}$ , horse manure  $\frac{1}{4}$  per cent.

With the exception of the red sand, all the foregoing materials are capable of giving off considerable volumes of carbonaceous gas and superheated steam, and hence under certain conditions act as mild explosives.

It has been ascertained by direct measurements made in the laboratories of University College that the amount of composition in the tube used in casting the roll at the Don Foundry would at the temperature of the molten metal (namely, about 1,250° C. or 2,300° F.), give off approximately 368 cubic feet or 2,300 gallons of a mixture of gas and superheated steam, that is to say an amount between five and six times the volume of the metal itself.

The cause of the disaster, I am sure, was not due in any way to damp present either in the mould or the core. After carefully reviewing the evidence and data obtained, I may remark in the first place that terrible as were its results, the accident cannot correctly be described as an explosion. There

was no report heard by anyone I questioned, and the foundry and its appliances were uninjured. Any sound heard would be of the nature of a deep rumbling, because what really took place may be more accurately described as a miniature volcanic eruption of molten metal propelled by gas and super-heated steam, and most of those in the foundry were burnt by the falling metal, which seems to have projected upwards to a height of about 20 feet.

The following sequence of events describes with substantial accuracy the causes of the accident:—

The metal had risen just above the face of the top tenon, or to a height of about 13 feet 6 inches. The core tube had expanded lineally 2 inches, lifting the chills forming the ballasting to about that extent. Diametrically the core tube had expanded so as to leave an annular space of about 1.40 of an inch between the iron and the composition forming the core proper. According to the drawing supplied to me, the chills used to ballast the core had an effective weight of about 5 cwt, but from the evidence of Messrs. Barker and Simmonite I am satisfied that the actual weight of ballast employed and its exact arrangement are details not definitely remembered. Taking the effective weight of the chills shown on the drawing to be approximately accurate, this, together with the weight of the core itself, would indicate that the total force to be overcome on lifting the core would be about 800 lbs.

I have calculated the upward thrust of flotation this weight would have to oppose would be about 400 lbs., hence, supposing the ballast to have remained in position, the margin of safety was ample; but I am convinced that the ballast did not remain in position, but that when it was lifted by the practically irresistible expansion of core, the chills forming the ballast slipped and the core tube shot up, leaving the composition in a fine state of division in the midst of the molten metal. The composition then instantly evolved large volumes of carbonaceous gas and steam, which violently escaping carried up with them about two tons of molten metal, which in descending fell upon most of those present in the foundry.

I have prepared a half-size model illustrating the upward thrust of the core due to expansion, and from this it will be seen that slight variations in the original arrangement of the ballast may readily cause it to assume a position of unstable equilibrium.

I have also prepared another model illustrating the upward thrust of the core by flotation. As some scepticism appears to exist as to the possibility of foundry composition becoming

explosive under any conditions, I have prepared a simple experiment to demonstrate this point, which should be thoroughly realised by every foundryman in Sheffield.

The means of preventing another disaster of this description are very simple.

1. The core ballast should be boxed in so that it cannot in any means slip.

2. To make doubly sure, a finely perforated wrought-iron plate should be screwed on to the bottom of the core tube, as to prevent in any circumstances any of the composition falling into the molten metal at the bottom of the mould.

Mr. Fowler, in an interview at the college, asked me to state in my report if I considered that blame could be attributed to anyone for the catastrophe. As I have already pointed out, the arrangement of the core from physical and chemical points of view involved elements of grave potential danger, but such danger could only be realised by metallurgists versed in chemistry and physics, and further taking into consideration the fact that several other rolls had been successfully lifted under apparently exactly the same conditions, I am of opinion that it would be unjust to attribute anything approaching carelessness or negligence to anyone concerned with the matter.

Professor Arnold stated that he did not believe in the generally realised that an accident of the kind could occur in such a place. The accident was unique. People were not aware that foundry composition would give off dangerous gases, and the subject should be carefully considered by all foundry owners. If an opening had been left in the core to let out the gas, the accident might not have happened.

The foreman said that he had been twelve years in the position, and that it was the first accident. The mould had been built up in the usual way; the bottom was perfectly level. Although chills have lifted a little on other occasions, this was the first time on which they had slipped off. There was no noise or explosion; the molten metal rushed out as from a fountain. The pit was perfectly dry, and neither snow nor rain could have blown into it.

Mr. Henry Cooper, of Vickers, Sons & Maxim, said he had agreed with Professor Arnold; there was no other way of account for the accident.

The coroner said that the information Professor Arnold had given had been purchased at a fearful cost. But it was a warning were taken and measures adopted to prevent such mishaps some good would arise. The jury returned a verdict that the men had met their deaths through pure accident.

## THE WEEK.

the late M. BENJAMIN CONSTANT, who died on Monday, allowed his imagination to revel unrestrained, he might well see himself as the leading portraitist of England and of the United States. He had painted portraits of Queen VICTORIA and Queen ALEXANDRA, and it was allowable to suppose that many important commissions must follow. Several portraits in France came from his hand, but if a vote could be taken it would be found that a majority of his countrymen regretted the attraction that art had for him. The works which they most admired were his great African scenes, which were mainly derived from Morocco. *La Vengeance du Chérif*, representing the impassable chief contemplating from the saddle his enemies who were dead or lying shackled under a burning sun awaiting his decision, was praised by us when it first appeared as the most characteristic of the master's works. He was one of the French painters for whom the glowing colours and the intense light by which the tropics are separated from the North became a passion. He was among the painters of scenes in the Alhambra, but he preferred a more southern region. Morocco prepared him for *Justinian*, in which the mosaics and gilding, the jewels and the costly robes of Byzantium appear to overcome the firework. He sought after magnificence, and thus it is that the portrait of the late QUEEN could hardly be said to be supreme amidst the carvings and metalwork of the Westminster building. It was not to be expected that a painter of his class would care much for the sombre dress of our time, and consequently we do not believe that as a painter of men he was equal to M. BONNAT with his indefinable backgrounds. The earliest work which denoted BENJAMIN CONSTANT's talent was the *Samson et Delilah* of 1872. Portraiture was the Delilah which allured him from his true course, although it enabled him to suggest that in portraits of women he was CABANEL's pupil.

SIR JOHN GORST did not exaggerate when, in his speech on Monday night, he said that the South Kensington Museum was more appreciated by foreigners than by Englishmen. The circumlocutionism which for so many years impeded the progress of instruction in art in this country was not able to be equally injurious in the selection and gathering of objects for the collections. Of late years the distribution of loans has been more generously organised than formerly. According to SIR JOHN GORST, in 1895 there were 52 provincial museums, receiving 19,929 articles, and in 1901 there were 88 museums receiving 26,149 objects. But in the schools of art in provincial centres in 1895 there were 241 schools of art receiving 6,057 objects, and in 1901 there were 289 provincial schools of art receiving 14,880 objects. The directors of provincial museums and the masters of provincial schools of art are constantly visiting the Victoria and Albert Museum, where they are in the habit of conferring with the circulation department, and where they are treated with every courtesy. Great activity is now displayed in making copies of all the great works of art for educational purposes selected from the Continent of Europe. Copies are made in electrotype, plaster, photography and coloured drawings, lantern-slides and books, and any suggestions offered by local museums and local schools of art receive the most careful attention. The Vice-President was also able to be laudatory about the arrangements in the Royal College of Art. He said it was not an amateurs' institution; a very high qualification was required for entrance. There were only 350 students who occupied places, and the claims of technical scholars received the first consideration. Craft schools were established for the more advanced students, and they are now taught etching and engraving, pottery, ministration, carving upon wood and stone and marble, and furniture decoration. They were assisted by technical masters, who served as a council of advice on technical matters to the President of the Board of Education, and each of them acted as visitor to that particular branch of the

school to which he belonged. The schools of art were now improving every year, and SIR JOHN GORST said he had no doubt they would be a credit to the community, the Board of Education and the Government.

THE annual report of the Amalgamated Society of Carpenters and Joiners concludes with a reference to the decision of the members to establish and carry on the business of builders and contractors in selected localities. It points out that whilst outsiders state that by so doing they will be carrying on a perilous venture, yet they as a society were not alarmed, but would at the proper time try such experiments in suitable neighbourhoods. The statement looks remarkably like the playing of a game of bluff by the Amalgamated Society. A builder's business even in a suitable neighbourhood cannot be established without the aid of capital. It is well known that for the first time in fourteen years the Amalgamated Society have been compelled to diminish their capital by the large sum of 22,424*l.*; for without that desperate resolve the year's expenditure could not have been met. The expenses amounted to 186,362*l.*, while the receipts were only 163,968*l.* Co-operation is occasionally found to have its uses, but up to the present industrial co-operation has rarely brought many advantages to those who participated in it. At another time the experiment might be tried, but it does not suggest wise councils to make a new departure when there is so wide a difference between income and expenditure.

EMERY is thought to resemble corundum, but while the latter is found to a large extent in India, where it is employed for cutting and polishing building stones, the emery most valued in Europe is derived from Naxos, in the Greek Archipelago. In 1901 the value of the emery exported from the island amounted to 24,243*l.* The production is a Government monopoly. The peasants of Naxos, who are about a thousand in number, have the sole privilege of working the mineral and of conveying it to the coast. Each peasant can deliver about 2½ tons at one time. It is a comparatively profitable occupation, for it means not more than from five to seven days' work per month per peasant. The extraction of the mineral is carried out on Medieval principles. There is an utter absence of methodical operation, which not only leads to constant waste, but at times to a partial destruction of the quarries. The primitive method of transport from the quarries to the coast and the absence of a safe harbour, which necessitates the further conveyance of the emery to Syra, are factors which tend to unnecessarily increase the cost of production. Thus, at the outset it is evident that the mineral is clumsily extracted and dearly transported. It is assumed that about 25,000 tons of emery are used every year, of which four-fifths come from Asia Minor and one-fifth from Naxos, the latter being preferred for its greater density, fineness and hardness of grain.

CYNICS have not hesitated to say that the pictures in the Parisian mansion belonging to M. and Madame HUMBERT were in keeping with the owners and their schemes, for they were not what they were declared to be. The experts appointed by the French law courts are, however, of a different opinion. No less than 379 paintings were removed from the house in the Avenue de la Grande-Armée. It is stated that the most important among them is a painting by the late PAUL BAUDRY which used to hang on the landing of the principal floor. There are also valuable works by other French masters, including JULES DUPRÉ, GUSTAVE MOREAU, MEISSONIER, COROT, DAUBIGNY, ROUSSEAU, SCHRAYER, ROYBET, VOLLON, ISABEY, BRETON, RIBOT, FORTUNY, &c. The paintings and other works of art have been officially valued at 1,200,000 francs. It is said that sixteen of the large furniture waggons used in Paris were required to convey the contents to the auction-rooms. It would have been impossible to have held a position in the French capital as a millionaire without appearing to patronise the arts, and dupes were therefore deceived by the fine pictures, furniture, bronzes and embroidery which were thought to be signs of the HUMBERT's affection for Renaissance work as well as for modern art.

## THE POSITION OF BOROUGH SURVEYORS.

THE Local Government Board have to consider a matter which, if compared with much else that is brought before them, may appear to be trifling. It is, however, of great importance, for on the decision of the Board will depend the manner in which municipal works, and especially those connected with sanitation, must henceforth be conducted. The circumstances are not peculiar. They resemble those which arise in a great many towns throughout England, although not always divulged.

A short time ago Mr. SAUNDERS, the surveyor of Chichester, resigned his appointment. The city has still an aspect of antiquity, which is exhibited not only in old buildings and walls, but in its administration. It was, for example, very conservative about drainage, or, in other words, dilatory in the construction of drains. The houses were in the condition which was to be expected with cess-pools forming part of the premises, but the citizens were content, although it was notorious that bread was baked over those receptacles, and in many kitchens and cottages a thin boarding was the only separation between them and the inhabitants. What made the case more extraordinary was that the late Bishop of the diocese was a leader in the anti-drainage movement as if opposing a heresy, and used all his influence for retaining abuses which elsewhere were known to be prejudicial to the health of the inhabitants.

A change, however, could not be prevented. A drainage system was forced upon Chichester. As was to be expected in a place where the people were so inimical to improvement, it has not been as yet a complete success. The place selected for the discharge of sewage gave offence to a neighbouring proprietor, and the Courts acceded to his demands for an injunction. In consequence there has been heard of late, when drainage is mentioned, the familiar cry of "I told you so," which is the formula for all opponents of improvements whenever perfection is not attained at the first trial. When such circumstances arise an endeavour is made to have a man rather than a system to serve as a chopping-block. The late Surveyor of Chichester was not the designer of the drainage works, and it was unfair to attribute any of their shortcomings to him. That Mr. SAUNDERS'S conduct in carrying out his duties was irreproachable is shown by the fact that although the Council was in an irritable mood, and therefore not unwilling to get hold of a scapegoat, the majority steadfastly supported the Surveyor. Indeed, they claim that they always treated him handsomely and respectfully. There were, however, two of the members who, on the admission of one of the aldermen, subjected the Surveyor to gross insults for several months. Owing to his treatment Mr. SAUNDERS resigned, and afterwards lodged a complaint with the Local Government Board.

According to custom the Board asked for explanations from the City Council of Chichester. On such occasions differences are disregarded and a corporate feeling for once gains the upper hand. As a rule local authorities contrive to lead a tolerably contented existence among themselves while in committee-rooms and council chambers, and there is an uneasy feeling at interference by a Government department. It was therefore said that the late Surveyor should have considered it beneath his dignity to make complaints, and that the quarrel was in reality a private one in which the Council as a whole could take no part. It is easy to forget how important his reputation is to every borough engineer. Moreover, he cannot expect that the proceedings at meetings in one town will be rightly judged years afterwards in another town. On that account it is well to have on record the opinion of the highest authority in the country on the causes of resignation.

There ought to have been no difficulty in furnishing a frank reply to the inquiries of the Local Government Board, but efforts were made to evade the duty for the sake of "peace," and in order to avoid any disagreeable results which might arise. It was also held to be dangerous if a precedent were set by which a court of appeal would be established in the Local Government Board for the benefit of municipal officials. It was only after a long discussion in which a varied strategy was displayed by the opponents that the following reply was agreed to:—"In answer to your inquiry the Corporation regret to say that they cannot deny the truth of Mr. SAUNDERS'S complaint. He has long

been subjected to personal vituperation and unwarrantable attacks in his official and professional capacity by the councillors he mentions. The great majority of Council, while utterly without sympathy with these attacks, have been powerless to stop them under the existing Standing Orders, and it appears that it would be difficult to deal with them under any amended Standing Orders framed to meet such cases, and yet not so drastic as to be liable to abuse in stopping fair criticism; neither has it appeared to the majority of the Council that it would be right to exclude those councillors from serving on sanitary or other important committees. The Corporation may be mistaken in their views upon these points, but would welcome an expression of opinion thereon from the Local Government Board."

It will be seen from the reply that justice to the Surveyor has overcome the corporate feeling which, as we have said, is a characteristic of the petty authorities of the country. That unwarrantable attacks were made upon him could not be denied. Then comes the startling acknowledgment of the inability of the majority of the Council to deal with such cases. We have been proud of ourselves over all other countries on the excellence of our system of local government, and yet when any of our members assumes the right to vituperate one of the principal officials, the individual who suffers can only say "sufferance is the badge of all our tribe," and in a chastened spirit accept abuse as an agent for his edification. For this reason the Local Government Board should deem it to be a duty to act with decision in the Chichester case, and treat it in such a way that it can always remain as an encouragement to surveyors and a warning to those who indulge in personal vituperation and unwarrantable attacks for their own gratification.

In other words, the time has come for the borough surveyor's position to be defined. He is assumed to be a servant of the body or authority by whom he was appointed, and it is not difficult to imagine his servitude to the members as individuals. There is no doubt that in a legal sense he is to a large extent like any ordinary servant or employé. If a surveyor passed from the service of a railway or other engineering company to become a town surveyor he would not find any diminution of his responsibility. But in his new capacity he would soon discover that he had accepted a post under an authority that was higher than that of a town council or an urban district board. When COLERIDGE obtained the post of secretary to Captain BALL, what struck him most on the man-of-war in the Mediterranean was the potentiality of an invisible, impalpable power which was law. BALL himself recognised its supremacy, and the roughest seaman had a notion of its presence and of its might. A like spirit is imagined to prevail in every town or urban district which is in connection with the Local Government Board. It commonly takes the form of a hygeia. The humblest surveyor is supposed to be mindful of its demands in designing and superintending whatever work has to be carried out at the general expense. Future as well as present needs have to be regarded, and it is assumed that a surveyor will resign rather than lend himself to any policy which he considers is likely to result in works which will be unsatisfactory. He must, in fact, realise something that is more elevated than any council board, and obey its behests, oblivious of the inconvenience to himself.

The condition of affairs being such as we have described without any exaggeration, it is manifest that a surveyor will seek to follow a compromising policy in order to insure his own peace is not likely to produce the most efficient drains and enduring roads, or to subdue the local deterioration. It is inevitable that differences of opinion should arise with regard to the character of contemplated works. Criticism is desirable, but it should be unlike the expressions of thoughtless liking or objection heard in a gallery of pictures. It is not to be expected that an amateur can instinctively grasp all the reasons which guide a surveyor in preparing plans and sections, and for that reason a little modesty when suggesting defects would not be unbecoming. But when criticism is expressed by vituperation, then it is time that a few new rules or standing orders should be available which are not yet found in any chairman's handbook.

The Local Government Board can discover without much trouble how easily a representative of ratepayers can become a surveyor's enemy. A councillor who would scorn to use a plank belonging to the municipality would have no hesitation in asking advice about the enlargement of his premises, the planning of a new house or the excesses in a landlord's account. It is not recollected that the surveyor's fee is no less the property of the municipality than a piece of timber. If the surveyor should insist on his assistance being treated as a marketable quality to be disposed of after office hours, friction follows which produces strange effects in the course of debates. A churchwarden has as much right to expect a vicar to teach his children gratuitously as a representative has to utilise for his own benefit the experience and knowledge of a surveyor. There are also times when a surveyor is compelled to put sanitary measures into operation against the relations or friends of members of local boards, or to insist on a rigorous interpretation of by-laws in their new buildings and alterations. When a man gives up a large part of his time for what he thinks is for the benefit of the public he usually considers he is entitled to something in return. It will be unfortunate for the public if that return is to be obtained only through the agency of a borough surveyor. The surveyor's duties, as we have said, are not limited in so definite a way as those of the employés of individuals. On that account, unless the Local Government Board will intervene, there is a possibility that much inconvenience will be caused to public servants, and sooner or later the public will suffer.

### THE ENCYCLOPÆDIA BRITANNICA.\*

At the beginning of the month we noticed the first instalment of the new edition of the "Encyclopædia Britannica," and we have now to deal with the second volume. There is no precedent in the history of publishing such expedition. To produce a quarto volume containing nearly eight hundred pages, with a large number of illustrations, including portraits, maps, reproductions of paintings, views and diagrams, is a feat which is creditable to our time and country. It is a further confirmation of HERSON'S remark about *The Times* being a living index of the colossal British power. Hitherto it was supposed that the regularity with which the monthly magazines appeared denoted the highest triumph of organisation, but a volume of the Encyclopædia is, at least, equal in quantity to a dozen ordinary magazines.

In variety, without considering other qualities, there are no periodicals which can compare with one of the volumes. Between "Austria-Hungary" and "Chicacole," which are the terminals of the second, a remarkable collection of eligible subjects existed for treatment. The preface essay, entitled "A General Survey of Recent Political Progress," by Mr. EDWARD DICEY, is a *résumé* of the history of Europe since 1870. Some of the statesmen who took part in the transactions are recalled in the biographies of BALFOUR, BEACONSFIELD, BEUST, BISMARCK, BRIGHT, CAIRNS, CASTELAR, CHAMBERLAIN, &c. Science, art and literature have also their representatives. This week many people must have heard for the first time about the Netherlands and its monarch. In the new volume there is an account of the African territory, as well as of King SWANIKI, who is described as "a very enlightened monarch as African princes go." The article on the subject by itself is sufficient to indicate the universality of the new series, wherein all matters which can be regarded as possessing any relation to the present time will be recorded.

For readers who are engaged in construction, the article "Building" is likely to have most interest. It has been contributed by Mr. G. P. POST, who is responsible for the planning of some of the lofty buildings in New York. He confines himself to steel-framed structures in the States,

which he considers as the most important development in building since the article in the ninth edition appeared. They are, he says, the natural and logical result of the introduction of new materials and devices, and of the application of modern science to the solution of the problem of economical science. Economy is of so much importance, it is declared that "each cubic foot constructed is commercially unprofitable which does not do its part in paying interest on the capital invested." In the words is a criterion of architecture which hitherto was inapplicable in Europe unless in the case of the railway sheds designed by civil engineers. Up to 1881 the limit of height was thought to be ten storeys, being ruled by the strength of the lower storey to support the dead load of the upper floors. A suggestion from a shot tower in New York was next turned to account, and the braced cage was introduced. By the arrangement the walls or exterior panels had only to carry their own weight, the floor loads being sustained by metal beams and columns. In 1883 the first building of the kind was erected in Chicago; it was successful, and as steel was cheap there was a rapid extension of the system. Mr. POST admits that "defects of proportion, material or workmanship, which would be of less moment in an old-fashioned construction, may become an element of danger in building with the steel cage, while the possibility of securing a permanent protection of all parts of the cage from corrosion is a most serious consideration." Care must therefore be exercised in painting, and it is said that the pigment which allows the spread of the largest percentage of oil is the most valuable as a preventive of corrosion. If precautions are taken for fire extinction, Mr. POST believes that a very tall steel-cage structure will become as substantial, durable and fireproof as a structure of ordinary height with interior columns and girders of iron.

At the time the article on bridges appeared in the ninth edition, the Tay Bridge was supposed to represent the most advanced construction. Towards the end of 1879 the bridge collapsed under a passing train, and 3,000 feet of girders fell into the estuary. Since then the loading forces acting on bridges have received more attention from designers. Wrought-iron has been superseded by steel, and the theoretical limit of spans has been nearly reached. The important question of safe load has yet to be answered in a way that expresses unanimity in conclusions. According to Sir BENJAMIN BAKER, "a bridge which would be passed by the English Board of Trade would require to be strengthened 5 per cent. in some parts and 60 per cent. in others before it would be accepted by the German Government, or by any of the leading railway companies in America." The consequence is that in England and the provinces the limits of working stress are variously interpreted. The English practice is for engineers of railway companies to get out designs in their own offices by their assistants, with the occasional aid of an expert. Advice may be sought from manufacturers, but the debt to them is rarely acknowledged. In the United States bridge building has become a business and, as was recently found in the case of the African bridges, there is a sufficient stock on hand generally to satisfy urgent orders. Professor UNWIN says:—

In the United States few railway companies design or build their own bridges. General specifications as to span, loading, &c., are furnished to bridge-building companies, which make the design under the direction of engineers who are experts in this kind of work. The design, with strain sheets and detail drawings, is submitted to the railway engineer, with estimates. The result is that American bridges are generally of well-settled types and their members of uniform design, carefully considered with reference to convenient and accurate manufacture. Standard patterns of details are largely adopted, and more system is introduced in the workshop than is possible where designs are more varied. Rivetted plate girders are used up to 50-foot span, rivetted braced girders for spans of 50 feet to 75 feet, and pin-connected girders for longer spans. Since the erection of the Forth Bridge cantilever bridges have been extensively used, and some remarkable steel arch and suspension bridges have also been constructed. Overhead railways are virtually continuous bridge constructions, and much attention has been given to a study of the special conditions appertaining to that case.

\* The new volumes of the *Encyclopædia Britannica*, constituting, in combination with the existing volumes of the ninth edition, the 11th edition of that work, and also supplying a new, distinctive and independent library of reference dealing with recent events and developments. The second of the new volumes, being volume xxvi. of the complete work. Published by *The Times*, London.

A class of engineering which has secured renewed attention since 1876 is that of inland navigation. The latest works in Europe are described by Sir E. LEADER WILLIAMS, and those in the United States by General ERNST. There is no doubt the development has been aided, as in the case of bridges and of tall structures, by the ease with which novel structures can be formed of steel. There is, for example, an aqueduct on the Manchester Ship Canal, designed by Sir LEADER WILLIAMS for the Bridgewater Canal, the swing portion of which consists of a steel trough carried by side girders 234 feet long by 33 feet high, the waterway being 19 feet by 6 feet, and as he remarks, "It is somewhat singular that the first fixed canal aqueduct in England should, after the lapse of 136 years, be replaced by the first swing aqueduct ever constructed." In order to carry the numerous railways across the canal on the skew, girders have been used in some cases of 300 feet span. The main roads which cross the canal required swing-bridges ranging from 500 to 1,000 tons each, and are worked by hydraulic power supplied by steam, gas or oil-engines. The Trafford Road bridge weighs 1,800 tons. There are some other canals in Europe which are also noticeable. In 1893 the Corinth Canal, which the Emperor NERO had commenced, was completed at a cost of about three millions. The Cronstadt Canal, finished in 1885, was designed by PETER THE GREAT; there are also the North Sea and Baltic Canal, the Brussels Canal, the Ghent Canal, the Bruges Canal, in all of which steel has been employed. The lifts which are now used are remarkable examples of power. One at Anderton, on the Weaver Navigation, has been in use from 1875. The French lift at Fontinettes is equal to lifting vessels of 300 tons; by one at La Louvière, in Belgium, vessels of 400 tons are raised; two still larger lifts, with a vertical traverse of 65 feet, are employed on the Trent Canal, in Canada.

In all the works we have mentioned cement is also an important element. The varieties have been described in an article by Mr. BERTRAM BLOUNT. Rotatory kilns have of late been introduced from the United States into England. The system is said to have many advantages, and is likely to replace the old methods of cement-making. In testing cement time is gained by using hot water to surround the pats; an unsound composition may be detected in twenty-four hours. The failure of cement is ascribed in all cases to want of skill and care in manufacture.

There are not many engineers among the biographical subjects. BESSEMER, who aided in the diminution of distance and the substitution of vertical for horizontal space, was a metallurgist rather than an engineer. One representative of the old school of railway men was GEORGE PARKER BIDDER, who died in 1878, and he is therefore, we fear, only a name to modern students of engineering, or is remembered simply for his skill in calculation. He was invaluable as an assistant to ROBERT STEPHENSON in committee-rooms, and in course of time he gained a reputation as a Parliamentary engineer. He was always a student, and open to new ideas. He was one of the earliest to perceive the utility of the electric telegraph, and it was through his influence that the first company was founded. As a consulting engineer his advice was sought by promoters of great works in most parts of the world. BIDDER was gifted by nature with a remarkable talent for arithmetic. No doubt he was able to make elaborate calculations in a manner that seemed instinctive, but he endeavoured to explain his short cuts to elaborate computations, and what he said should be made more generally known in technical colleges. The men who write books on arithmetic, as on mathematics in general, are secluded students. Their method may be philosophic, but it has not the promptitude of BIDDER's, which seems to be in danger of being forgotten.

The article on "Barracks" is further evidence of social progress. Colonel LOCOCK suggests the differences between past and present in an able manner. In 1857 the annual rate of mortality of soldiers in this country was 17.5 per thousand, in 1897 it was reduced to 3.42 per thousand. There is no doubt the improvement in the character of the barracks was one of the chief factors in increasing the duration of a soldier's life. The English official rule is an allowance of 57 feet of floor space and 600 cubic feet of air space per man in a permanent barrack-room. In hospitals the floor space is added to by one-half, and the

air space doubled. Hollow external walls were favoured for several years, but the tendency now is to have the solid. The fresh air inlets are arranged at the rate of 10 square inches per man in barrack-rooms and 20 square inches per patient in hospital wards. The allowance of light in open positions is 1 square foot of glass to 100 cubic feet of air space. No rooms are to be less than 9 feet high, the majority being from 9 feet 6 inches to 11 feet 6 inches. In stables each horse is given at least 1,500 cubic feet of air space and 85 to 110 feet of floor space. The stalls are 11 feet long by 5 feet 6 inches to 6 feet wide; in inferior stables the minimum is 1,800 feet of air space per horse, it rises to 2,000 cubic feet. In India the allowance is larger.

The Channel Tunnel scheme is described by Professor BOYD DAWKINS, who was consulting geologist to the company. He is confident that if the works had not been stopped by the Government in 1884 they would have been easily carried to completion. After standing for five years the driftway on the English side, which has a length of about 3,200 yards, was "as dry as any similar driftway could be, and the marks of the boring machine on the polished surface of the chalk were as distinct as on the day when they were made."

We have confined our notice to subjects which are usually considered to be severely technical. From our references to them it will be apparent that the writers have viewed the necessities of practice, and they are addressed to architects, engineers, contractors and manufacturers, whom the information given will be serviceable. It is sometimes believed that an encyclopædia appeals mainly to the general reader, but in the "Encyclopædia Britannica" the requirements of special callings are not neglected. The new volumes can be compared to a great structure which countless materials are utilised. Some are ornamental and delightful, but there are others which are adapted to sterner purposes, and furnish that scientific positiveness, that firm foundation which should belong to important works in literature as well as in building.

## THE SOCIETY OF ARCHITECTS AT WINCHESTER.

A MOST delightful day was spent on Saturday by the party that Mr. Silvanus Trevail, as president of the Society of Architects, brought to Winchester. They numbered over six ladies and gentlemen, for whom special saloon carriages were in readiness at Waterloo Station. These were attached to the nine o'clock express train, and in a little over two hours, after passing through some of the most charming scenery in England, the historic city of Winton was reached. There everything had been carefully prearranged, so that not a minute was lost. First the old West Gate House was visited, recently converted into a branch of the Municipal Museum, and where greatly interested the party was the complete collection of Winchester's ancient weights and measures dating from the Plantagenet period, and comprising the famous bronze standard bushel. Next the party were taken to the Assize Courts and the grand old Winchester Hall, where they were met by Mr. Wyndham Portal, the chairman of the Hampshire Quarter Sessions, who gave a highly interesting address upon the Hall and its historic associations. Its erection was completed in 1235. Here Simon de Montfort's first Parliament met, and its successors for 400 years afterwards. Henry V. chose the Hall in which to expound his policy for the invasion of France, which culminated in the victory of Agincourt. For 600 years the king's commission had been executed here, and to-day the building is just as sound as it was in the thirteenth century. Mr. Portal informed the party that the rolls of the knights of the shire, the lord lieutenants and the sheriffs were carefully kept here, and everything that was possible done to preserve the ancient character and associations of the Hall. On the western end hangs what purports to be King Arthur's Round Table. At least, the table is known to have occupied its present position for five centuries, and just below is still the "speaking tube" through the wall by which Henry V. summoned his guards. After the Hall the new infirmary barracks were visited by permission of Sir Baker Russell, who commands the district, the party having been met by Captain Harvey, R.E., who in the most courteous manner explained the details of their arrangement and construction. What makes them additionally interesting is the fact that they occupy the site of a former palace of Charles II.

This was a good morning's work, and the party adjourned for luncheon, which was served at the George Hotel. Here

they were joined by the Mayor of Winchester, Captain Harvey, E., Mr. James Nisbett, F.R.I.B.A., Mr. Galbraith, and several other local gentlemen who were to take part in the afternoon's proceedings. After grace, the President proposed no toasts only, "The King" and "The Mayor and City of Winchester," the latter from the municipal standpoint in very eulogistic terms, wherein full justice was done to Winchester's antiquity and historical records. The mayor, Mr. F. Cancellor, responded, and remarked how delighted the old city was to entertain such a party of ladies and gentlemen who were so keenly appreciative of what gave to Winchester its unique position among the municipalities of the kingdom. Captain Harvey also responded, and mentioned the pleasure it had been to him to take the party over the headquarters of the Hampshire regiment.

The hour had now arrived for the visit to the cathedral, the glory of the city, and there the party were met by the Very Rev. the Dean of Winchester, who conducted them through the ancient fabric, taking first the nave, then the transepts, then the crypt and afterwards the choir, retro-choir, lady-chapel, and various tombs and memorial chapels, describing all in the most minute manner. The Dean carefully showed where there had been variations and transitions in styles of architecture corresponding with the periods of erection. Here, too, were the caskets containing the bones of many of the Saxon kings, as well as that "Mecca" to the British architect, the mortuary chapel and altar-tomb of William of Wykeham, prince of architects and Bishop of Winchester, who had founded colleges, built churches, abbeys and cathedrals, and generally left his mark and influence upon the monumental architecture of this country that time itself will scarcely be able to obliterate.

On the President's taking leave of the Dean, the party were met by the Bursar of the Winchester College, who, by permission of the Warden, the Rev. G. Bolles Lee, M.A., took them over that interesting old educational institution, which still keeps up its traditional wooden platters and various other forms and ceremonies that carry our thoughts back to the mediæval period.

From the college the party were taken by Mr. James Nisbett, F.R.I.B.A., past the former episcopal palace—that old bishop Trelawny assisted to partially demolish, on the ground that it was too extensive for its purposes—to the remains of Wolvesey Castle. Here the party were treated to an address from Mr. Nisbett, not only on the castle itself, but on mediæval military architecture generally, showing by the various discoveries he had made through excavations and otherwise the main objects sought in the planning of such strongholds. To this was added a *résumé* of the history of the country from the time of Stephen and Matilda downwards, even to the Stuart period. From Wolvesey Mr. Nisbett conducted the party past the recently erected colossal statue of Alfred the Great in bronze, standing on two enormous blocks of Cornish granite, to the Abbey House, Winchester's official residence for its mayors. Here the Right Worshipful the Mayor (Mr. B. D. Cancellor) was "at home," and entertained the party to an acceptable tea, and afterwards accompanied them to the guildhall, museum, council-chamber, city courts, &c. In the Mayor's parlour His Worship had had specially set out the Corporation plate, maces, &c., and a most interesting collection it was, comprising no less than four silver plates of exquisite design and most massive proportions. There were beautiful loving-cups, sauce-cups, salts, platters, seals, oblets, bowls, and last, but by no means least, the Mayor's official chain and badge, which is very massive and of rich design. In the Mayor's parlour were also a very interesting collection of portraits of past Mayors and Bishops of Winchester, among them being many men of great eminence in national as well as local history.

With this memorable and courteous reception on the part of the civic authorities the day's official programme terminated, and just in time for the party to comfortably reach the station for the eight o'clock express, by which they travelled to Waterloo. Not, however, before a hearty wave-taking from Winchester's genial chief magistrate, and an earnest expression of heartfelt thanks by Mr. Trevelyan on behalf of the party for the generous and handsome manner in which they had been received, which he said would make a deep impression in their minds for the years yet to come, and how those still responsible for maintaining Winchester's ancient traditions so worthily followed in the footsteps of their predecessors.

On the way back a special vote of thanks was proposed to the President for one of the most delightful "Field-days" that the Society of Architects had ever experienced. In responding he stated that the gentlemen they were mainly indebted to were, first, the secretary, Mr. McArthur Butler, next Mr. Galbraith, who was mainly responsible for the local arrangements, and after that, so far as the Society were concerned, to their worthy colleagues the vice-president, Mr. G. Gard Pye, and hon. secretary, Mr. E. Marsland. Above and beyond all

they owed much to those representing the authorities of Winchester, civic, ecclesiastic and military, in the persons of the Mayor, the Dean, Captain Harvey, Mr. Wyndham Portal, the Bursar of the College, and Mr. Nisbett, each and all of whom had so generously and so handsomely placed themselves at the service of the party and thus maintained the honour and the traditions of Winchester.

### AN ARISTOTELIAN INSCRIPTION.

IN the *Manchester Guardian* Canon Hicks has given an account of an inscription relating to the son of the Stagirate philosopher. He says:—Aristotle, the greatest name in the history of thought, was born at Stageira, in Thrace, of substantial and even wealthy parentage. Left early an orphan, he was brought up by his guardian, Proxenus of Atarneus. It would seem as if fraudulent trusteeship was no rare crime in ancient Greece; Demosthenes, Aristotle's contemporary, was robbed of his whole patrimony in this way. But Proxenus was scrupulous in discharging his duty to his ward, and Aristotle, in return, felt towards him a life-long obligation. It turned out that within a few years Proxenus and his wife died, leaving a son Nicanor. This youth Aristotle formally adopted as his own son, and (as if to draw the tie yet closer) pledged him to be the husband of his daughter Pytheas. Everyone is aware that the great philosopher was selected by Philip of Macedon as the tutor of young Alexander, and that at Pella, in Macedonia, the future conqueror of the world, along with other young princes and nobles, pursued his literary and historical studies under Aristotle's daily guidance. These and many other details of his biography are sufficiently certified to us, although we have to depend upon comparatively late and second-hand authorities. Contemporary documents, with the exception of Aristotle's will, are almost wanting.

It will be understood, therefore, how much interest attaches to a discovery, lately made, of an inscription of the contemporary period which mentions both Aristotle and his son by name. As a matter of fact, it is but rarely that we have the delight of finding the name of some great historical character inscribed upon a monument. Only here and there among the thousands of Attic inscribed marbles do we come across names of the first historical rank like Nicias and Alcibiades. Delphi, indeed, gives us statue-bases inscribed with the name of Gelo, and ex-votos from Olympia contain the name of Hiero. Among the marble records of Athenian festivals we come upon the names of Æschylus and Sophocles as playwrights, and not long since the Roman archæologists were startled to read the name of Q. Horatius Flaccus duly inscribed as the author of the "Carmen Seculare." Such surprises, however, are rare, and this fact lends a new interest to the document now to be mentioned.

On the site of the ancient Ephesian theatre, so familiar to the readers of the Acts, the Austrian scholars have been continuing the explorations so bravely commenced over thirty years ago by Mr. J. T. Wood. This theatre had been considerably repaired and decorated, probably in the reigns of Trajan and Hadrian. Among other changes, a number of marble slabs covered with decrees granting honours to distinguished public men were removed from the Temple of Diana and used (without regard to their precious contents) for the decoration of the theatre. Many of these inscribed slabs, belonging to the fourth or early third century, B.C., were secured by Mr. Wood for the British Museum, and have been long ago published. But some others, which escaped the search of Mr. Wood, have rewarded the Austrian explorers. One slab, fairly free from other breakage, had the misfortune to be used by a mason of that time for building in horizontally. In order, therefore, to make a "bed," he has chiselled out relentlessly the whole central surface (originally inscribed with a decree), leaving only a surrounding margin of a few inches. On this remaining margin, however, we can read, in the plain yet handsome letters of the fourth century B.C., as clearly as when first cut, "It seemed good to the Senate and people: on behalf of Nicanor of Stageira, son of Aristotle." Much of the rest is mutilated, but quite enough survives to reveal that the decree granted to Nicanor the freedom of the Ephesian city, with other complimentary privileges.

Now "Nicanor the Stagirate" is a personage well known in Greek history. Nor has conjecture failed to identify him with the "son of Aristotle." For of course by adoption he would become a citizen of the same city as his father. But conjecture is made practically certain by the discovery of this interesting document, which has just been made the subject of a scholarly pamphlet by Professor R. Heberdey, of Vienna. It was Nicanor the Stagirate who was sent by Alexander from Babylon, in the very year before his death, to proclaim at Olympia the restoration of all political exiles. It was a grand and significant stroke of policy. It marked the final suppression of the old civic struggles of Greece. It had been traditional in every city for the party in power—whether the oligarchic or the democratic—to banish ruthlessly the leading men of the opposite side. Inasmuch as Alexander's friends

were dominant in nearly every city, the "exiles" would largely have belonged to the anti-Macedonian interest. But many of them had become soldiers of fortune, and had followed Alexander in his Eastern conquests. Now that the war was over they were straggling back to Greece without home or purpose in life, and were likely to be a danger to social order. The master of the world accordingly, with wise forethought and not without magnanimity, dictated to the Greek cities the readmission of all exiles. In so doing the conqueror assumes that the local liberties and traditional politics of the Greek cities are no more. It is significant that the bearer of this decree is the son of Aristotle, who had learned from his great teacher and adoptive father what all Aristotle's political writings tended to show, namely, that while the type of social and intellectual life exhibited by the Greek cities was probably the finest in the world and worthy to survive, yet little store was to be set by particular factions or political parties. Their changes and chances were many and perpetual, and a stable constitution could hardly be hoped for from them. Demosthenes might dream of Athenian patriotism and endeavour with a noble eloquence to revive the ideals of the past; but to Aristotle the vicissitudes of Greek political history were facts to be studied and classified and reported upon—things rather of the past than of the present. Greece under Alexander's influence was losing herself in Hellenism. It was appropriate that "Aristotle's son Nicanor" should be entrusted with this characteristic proclamation.

Upon Alexander's death in 323 B.C. there began that series of struggles between his generals and their sons which makes the end of the fourth and beginning of the third century one of the most military and chaotic and tiresome periods of history. There is nothing but war and bloodshed in every quarter, and the situations change as rapidly as a game on a chessboard or the patterns in a kaleidoscope. In 318 Cassander, the claimant to the Macedonian throne, sent his trusted friend Nicanor to attack his enemy's fleet under Cleitus at the Dardanelles. We need not hesitate to identify this Nicanor again with the son of Aristotle. Aristotle had been a friend of Cassander's father Antipater; it was natural that the sons should be loyal friends likewise. Nicanor on his way to the Dardanelles (so we read) "took over also the fleet of Antigonus." We are not informed by any author in what harbour Antigonus's fleet lay and where Nicanor joined it. But this decree is enough to point irresistibly to Ephesus as the port. Ephesus was, we know, the headquarters of Antigonus, and one of the chief cities of his dominion. We can readily enough supply in imagination the circumstances in which the decree was passed and inscribed. Nicanor arrives from Athens (B.C. 318) at Ephesus in command of Cassander's fleet. He asks and receives at once the assistance of the fleet of Antigonus. He lands while the fleets are preparing to sail from Ephesus to engage Cleitus off Besika Bay. He is welcomed in the public assembly of the Ephesians as the friend of Alexander the Great, and now the admiral of the rising Cassander. He receives the grant of the freedom of the city, together with much complimentary eloquence, now happily lost. Nothing, indeed, remains but the dry, formal statement of the grant, recorded as usual on a marble slab, and now, after so many centuries, recovered and read by the curious eyes of the modern historical student.

If it be asked why the old writers never spoke of "Nicanor" or "Nicanor the Stagirite" as being the son of Aristotle, we must remember that the surpassing splendour which now attaches to the name of Aristotle and invests with romantic interest the slightest new fact we can learn about him, could not have struck his contemporaries in the same degree. To the historians of his day (from whom our existing authorities have copied) Nicanor was simply Nicanor the Stagirite; he was himself and not merely the son of his father. And the name of Aristotle here added on the marble, however great the interest it has for us moderns, found its place in the Ephesian decree simply because a public decree was a formal affair and was bound therefore to give the person mentioned his full and formal style and designation, and this was neither more nor less than "Nicanor, son of Aristotle, the Stagirite."

## TESSERÆ.

### Italian Wreaths and Festoons.

IN the course of his autobiography, Benvenuto Cellini refers to the manner in which contemporary sculptors in different districts carved the wreaths and festoons which are commonly known as "swags" in modern times. In Italy, he says, there is a variety of tastes, and foliage are cut in many different forms. The Lombards make the most beautiful wreaths representing ivy and vine leaves, and others of the same sort, with agreeable twinings highly pleasing to the eye. The Romans and Tuscans have a much better notion in this respect, for they represent acanthus leaves with all their festoons and flowers winding in a variety of forms, and amongst these leaves they

insert birds and animals of several sorts, with great ingenuity and elegance in the arrangement. They likewise have recourse occasionally to wild flowers, such as those called "lion-mouths" from their peculiar shape, accompanied by other fine inventions of the imagination, which are termed grotesque by the ignorant. These foliage have received that name from the moderns because they are found in certain caverns in Rome, which in ancient days were chambers, baths, studies, halls and other places of the like nature. The curiosity happened to discover them in these subterranean caverns whose low situation is owing to the raising of the surface of the ground in a series of ages; and as these caverns in Rome are commonly called grottoes they from thence acquired the name of grotesque.

### Ideal Beauty.

Scarcely any object in nature, however generally pleasing is found so perfect in all its parts that some one or other of those parts may not be discovered in greater perfection in some other objects. Every object that nature presents to us has what are termed accidents. These accidents are varieties of form, or, more correctly speaking, departures from the perfect canon or standard of form of that object. Ideal beauty consists in the selection and combination of all the most perfect parts in one complete whole. No portion of this can be invented or originated by the artist, for nature being his only model any independent conception of his own respecting form could only result in absurdity and deformity. The supposition therefore that ideal beauty is ever intended to mean imagined beauty and not beauty that does exist and may be found, is based on a mistaken apprehension of the term. It is the province of the artist to reject the accident and to restore the absent perfection. By doing this skilfully throughout his work he produces perfect beauty, or what in technical language has been called "ideal beauty." It is obvious that ideal beauty cannot be comprehended at once and intuitively. It must be the result of great observation, study and considerable knowledge of form, and applied to the human figure requires an intimate acquaintance with its capability of action, and the character forms assume under particular circumstances. The ideal beauty of one class is not the beauty of all classes. Thus beauty exists in the Apollo; in the Theseus and the Ilyssus; in the Venus of Melos and the Venus de Medicis; but in all these and other well-known examples, it is only ideal beauty as it illustrates in perfection the class of subject to which it is applied. The best school in which true beauty of form can be learnt and its principles studied is fine Greek sculpture—not because art is superior to nature, but because the Greek sculptors selected and copied and applied all the best forms in nature, and therefore their works illustrate, and so far facilitate our becoming acquainted with the laws of beauty. They have, as it were, provided the best books for our learning a difficult language.

### Ancient Japanese Dwellings.

Japanese antiquaries tell us that in early times, before carpenters' tools had been invented, the dwellings of the people who inhabited the islands were constructed of young trees with the bark on, fastened together with ropes made of the rush, or perhaps with the tough shoots of the wistaria, and thatched with the grass called kaya. In modern buildings the uprights of a house stand on large stones laid on the surface of the earth; but this precaution against decay had not occurred to the ancients, who planted the uprights in holes dug in the ground. The ground plan of the tent was oblong, with four corner uprights, and one in the middle of each of the four sides, those in the sides which formed the ends being long enough to support the ridge pole. Other trees were fastened horizontally from corner to corner, one set near the ground, one near the top, and one on the top, the latter of which formed what we call the wall plates. Two large rafters, whose upper ends crossed each other, were laid from the wall plates to the heads of the taller uprights. The ridge pole rested in the fork formed by the upper ends of the rafters crossing each other. Horizontal poles were then laid along each slope of the roof, one pair being fastened close up to the exterior angle of the fork. The rafters were slender poles, or bamboos, passed over the ridge poles and fastened down on each end to the wall plates. Next followed the process of putting on the thatch. In order to keep this in its place, two trees were laid along the top resting in the forks, and across these two trees were placed short logs at equal distances, which, being fastened to the poles in the exterior angle of the forks by ropes passed through the thatch, bound the ridge of the roof firmly together. The walls and doors were constructed of rough matting. It is evident that some tool must have been used to cut the trees to the required length, and for this purpose a sharpened stone was probably employed. Such stone implements have been found embedded in the earth in various parts of Japan in company with stone arrow-heads and clubs. Specimens of the ancient style of building may even yet be seen in remote parts of the country, not so much, perhaps, in the habitations of the peasantry as in sheds erected to serve a temporary purpose.

### Ancient Buildings of Central America.

The Mexican Indians, besides a perfect knowledge of stone cutting and laying, were well acquainted with various kinds of mortar, stuccoes and cements, and large masses of excellent concrete are found in many of their buildings. They were, in fact, so far as the mechanical part went, accomplished masons. In another department of art which requires more knowledge and science than the building of pyramids and temples they were in no wise inferior to the Egyptians—to the preparation, mixing and use of pigments. Their painting is indeed superior both to their architecture and sculpture, and they went even beyond the Egyptians in the blending of colours, approaching more nearly to the paintings found at Pompeii and Herculaneum. In one of the rooms of a large building at Chichen Itza are paintings covering the entire walls from the floor to the ceiling. The apartment may be 30 feet long, 12 feet wide and 15 feet high. The figures are not more than 6 inches to 12 inches in height, but most interesting subjects are represented, abounding with life, animation and nature. In one place are seen warriors preparing for battle, in another the fight is at its height, castles are attacked, defended and taken, and various military executions follow. This forms one section of the wall. In another are seen labours of husbandry, planting, sowing and reaping, and the cultivation of fruit and flowers. Then follow domestic scenes, and others apparently of a mythological nature—indeed, almost everything requisite to give us an intimate acquaintance with Indian life is depicted. The subjects are too numerous to mention, and such was the multitude of figures and objects that a month would not have sufficed for delineating them. Unfortunately these beautiful paintings are fast hastening to decay, and every day adds to their approaching obliteration from the visits of Indians. The prevailing type of the architecture in the central parts of America and Yucatan consists in first constructing immense pyramidal mounds or terraces of greater or less height, and on these placing their sacred edifices and palaces. Whether these are called mounds or, as some call them, pyramids (and by the Indians they are called *teocalli*) are in general solid or contain in all cases passages and apartments remains yet to be ascertained. In the few that have been opened, by accident or design, small richly decorated rooms have been found. The buildings are generally long, low, arched and of a single storey, a plan frequently adopted by the Spaniards on account of the shocks of earthquake to which many parts of the country are exposed. In a few instances buildings of two and three storeys were met with. The *teocalli* before mentioned are found in great numbers throughout the country. They are frequently of large dimensions, of a pyramidal form, but do not terminate in a point like the Egyptian structures. They have on their summits platforms of sufficient extent for their temples, which contained statues of their deities, and in front was seen conspicuous the sacrificial stone or altar, convex on its upper surface so as to raise the chest of the human victim.

### Technique in Painting.

There is a want of sound judgment generally shown in the appreciation of the minor excellences in every art. The twirl of a brush is not painting, the flourish of a cadence is not music, nor the turn of a couplet poetry. These qualities rather convey an idea of trickery than of real excellence in the respective arts. That execution is alone true and good which makes us acquainted with the mind of the painter, and it is well or ill done according as it approaches or recedes from the standard of stern and uncompromising truth. All other execution, however charming, is false, and to use a technical term smells too much of the palette. Thus, the execution of Rubens may astonish the eye, but that of Titian makes us forget the art; Moore may win the fancy, but Shakespeare entralls the mind; Donizetti may tickle the ear, but Mozart enchants the soul. In the work of those three great masters (not that in their respective arts we compare them with each other) we forget the means they employ, and only receive the spirit of their creations. The work is so well done that it assists, but does not interfere with the soul's contemplation. For when the eye or ear rests with complete satisfaction on the outward manner the great purpose of the artist is lost. Therefore that execution is alone perfect which does not invite or fix the attention on its own peculiar qualities, though the public may be better pleased by a more ostentatious display.

### Rembrandt.

If ever there was a man of genius in the proper sense of the term, he was Rembrandt. He lived in and revealed to others a world of his own, and might be said to have invented a new view of nature. He did not discover things out of nature, in fiction or fairyland, or make a voyage to the moon "to descry new lands, rivers, or mountains in her spotty globe," but saw things in nature that everyone had missed before him, and gave others eyes to see them with. This is the test and triumph of originality, not to show us what has never been, and what we may therefore very easily never have dreamt of, but to point out to us what is before our eyes

and under our feet, though we have had no suspicion of its existence for want of sufficient strength of intuition, of determined grasp of mind, to seize and retain it. Rembrandt's conquests were not over the ideal, but the real. He did not contrive a new story or character, but we nearly owe to him a fifth part of painting, the knowledge of *chiaroscuro*—a distinct power and element in art and nature. He had a steadiness, a firm keeping of mind and eye, that first stood the shock of "fierce extremes" in light and shade, or reconciled the greatest obscurity and the greatest brilliancy into perfect harmony; and he therefore was the first to hazard this appearance upon canvas, and give full effect to what he saw and delighted in. He was led to adopt this style of broad and startling contrast from its congeniality to his own feelings; his mind grappled with that which afforded the best exercise to its master powers; he was bold in act, because he was urged on by a strong native impulse. Originality is then nothing but nature and feeling working in the mind. A man does not affect to be original; he is so because he cannot help it, and often without knowing it. This extraordinary artist indeed might be said to have had a particular organ for colour; his eye seemed to come in contact with it as a feeling, to lay hold of it as a substance, rather than to contemplate it as a visual object. The texture of his landscapes is "of the earth, earthy;" his clouds are humid, heavy, slow; his shadows are "darkness that may be felt," a "palpable obscure;" his lights are lumps of liquid splendour. There is something more in this than can be accounted for from design or accident. Rembrandt was not a man made up of two or three rules and directions for acquiring genius.

### THE WESTMINSTER CITY HALL.

THE increased importance which Westminster has attained by the new division of the Metropolis has necessitated a transformation of the St. Martin's town hall, involving much troublesome work. The architect who designed and directed all the operations is Mr. John Murray, F.R.I.B.A., and the

general contractors Messrs. are Patman & Fotheringham, Ltd. The building was opened yesterday (Thursday), by H.R.H. the Duke of Cambridge, K.G. The gold key used, of which we give a sketch, was designed by the architect. Next week we shall publish a view of the building.

## NOTES AND COMMENTS.

DRINKING-HORNS have been popularly assumed as handed round only in the festivals of northern races. The ryton, which was a similar vessel, was long used in Greece, and mention is made of it by DEMOSTHENES. It is found represented on ancient vases, and several were discovered at Pompeii. The Greek forms were likely to have been derived from the horns of oxen, which were at first utilised as cups in Greece as well as in northern regions. But in Greece they gradually assumed other forms, and especially the heads of animals. The idea is not pleasing of putting the snout of a hound or a hog into a human mouth and drinking from an orifice, but the ancients were not always refined in their conduct at meals. Among the remains which were lately met with in the excavations at Tarentum is a silver ryton which resembles the head of a young deer. The style of ornament is so beautiful, the vessel is supposed to have been brought from Athens in the fourth century before the Christian era. On the neck has been introduced a scene in Olympus, probably between ZEUS and HERA. The horn has been placed in the museum at Sofia, where there is a similar example adorned with figures of satyrs.

SECTION 63 of the London Building Act of 1894 provides that every new building exceeding 60 feet in height shall be provided in all the storeys above that height with such a means of escape in case of fire for persons dwelling or employed therein as can be reasonably required under the circumstances of the case. This was new legislation, for when the previous Acts were under consideration it was not anticipated that high buildings would become general. The County Council have powers to make by-laws on the subject which to some extent become retrospective. On Tuesday last Mr. W. R. RICKARDS, the building owner of the lofty mansions in Westminster and Buckingham Gate, was summoned for failing to provide proper means of escape in case of fire. In last November the County Council approved of plans for the precautions demanded, but the work was not carried out, and Mr. RICKARDS was fined 20s., and in February the summons was adjourned for three months. For the defence it was stated that no blame was attached to the defendant. Orders had been given, but the engineers were unable to carry them out in the time specified. A penalty of 20s. was again imposed, with three guineas costs.

THE position of AUGUSTE COMTE as a philosopher has been disputed, but no less can be said of all his predecessors. What is most remarkable is that, while the law of evolution is generally accepted as the solution of many, if not all, difficulties of a metaphysical kind, COMTE's connection with it is ignored. As a consequence the only memorial of COMTE which was found in Paris was his modest apartment in the Rue M. le Prince in the Quartier Latin, which many Englishmen visit from time to time. At length a memorial of him has been set up in the Place de la Sorbonne; it is the work of M. INGALBERT. Like so many of the recent examples of its class, a bust is substituted for the full length statue, and it is accompanied by emblematic figures. On one side of the pedestal is a young man seated on an anvil reading a treatise on Positivism, on the other side is a figure of Humanity, who carries an infant and presents a branch of laurel. The unveiling was presided over by General ANDRÉ, the Minister of War, as the representative of the Government. He spoke of the political influence of COMTE, and declared the law of progress, or *loi des trois états*, as being as inevitable as the law of gravitation.

THE application of electricity is only in its infancy, and as improvements arise it must be expected that various arrangements will have to be superseded. In Birmingham the electric supply committee of the Corporation have been able to report a large increase in the units sold during the year. The gross profit has amounted to 18,514s., but as the conversion of a portion of the system from 110 to 220 volts has been charged against revenue, instead of a profit there is a deficit of 4,812s. The reason is, as the report points out, that the change from the older voltage is

necessarily costly, as it not only involves changing the lamps of consumers but necessitates the rewinding and renewing of motors and modifying certain fittings on consumers' premises so as to adapt them to the new conditions. At the works also considerable modifications in the switchboards and alterations in certain of the generating machinery have been rendered necessary. The committee remind the Council that it is only within the last few years that the use of the higher pressure has been made possible by the invention of the high-voltage incandescent lamp. All new extensions made on the higher voltage system, which entails a much smaller capital outlay in main laying, and for the economic working of the department it is necessary that the generating and distributing system should be at one standard pressure. This is effected by the change, and though the cost is heavy the advantages of the uniform higher pressure are so great as to fully justify the outlay. Application has been made to the Local Government Board for power to raise a loan of 251,974s. for the equipment and erection of the proposed station in Summer Lane. It is also intended to include in the General Powers Bill clauses which will enable the Corporation to supply electrical energy in bulk to the adjoining local authorities, and that the committee may supply electrical energy to light railways or tramways, and they impose regulations as to the right of consumers to demand supplies.

THE removal of the Royal Arms from the Limerick town hall suggests the mixture of malice and absurdity which is characteristic of modern Irish humour. But it was wise to avoid making a State trial of the affair. The carving is an excellent example, and there are grounds for supposing it is the work of GRINLING GIBBONS. At one time it was set up in the cathedral. Limerick is singularly deficient in memorials of the past, although the so-called "treaty stone" is considered to be all-sufficient. According to Judge ADAMS, the charters found their way to the tobaccoists. This is different from the Dublin practice, where records are preserved, although not often needed. The Irish capital, it appears, was given to the men of Bristol by HENRY II. to inhabit, and accordingly when any of the ancient customs or privileges of Dublin were attacked it was sufficient evidence that such or such a custom existed in Bristol to have it justified. The Royal Arms of Limerick should be preserved within a building, otherwise the roughs may show their bravery by making another foolish attack on the carving.

## ILLUSTRATIONS.

ST. PAUL'S CHURCH, GREENOCK.

THIS church has been erected for a new parish lately created in Greenock. It accommodates about 800 of a congregation, and consists of a nave with two aisles and a longer choir than is usual in Presbyterian churches. It is built of red Dumfriesshire stone, the walls inside being lined with fine brick and stone bands. The building has been erected from the designs of Mr. R. ROWAND ANDERSON, LL.D., Edinburgh.

CHURCH OF ST. JOHN THE EVANGELIST, BROWNSWOOD PARK, N.

"WEST SUSSEX GAZETTE" OFFICES, ARUNDEL.

THE *West Sussex Gazette* offices, High Street, Arundel, were erected last year. The idea has been to design a building which should be suitable to this ancient Sussex borough, and at the same time provide for the various requirements of a newspaper office. The ground floor is of Ancaster stone, the whole of the upper portion is of oak, with red-brick panels to first floor and rough-cast above. The roof is covered with old Sussex stone healing. The front part of the ground floor is occupied by the commercial staff, and is fitted up entirely in oak. Behind are the editorial offices and at the extreme end the printing works. The work was carried out by Mr. W. WALLIS, of Balham, from the designs of Messrs. FREDERICK WHEELER & LODGE, Bank Chambers, Carfax, Horsham, and 6 Staple Inn, London, W.C. The ornamental metalwork was executed by Mr. J. F. GARROD, of 10 Archer Street, W.

# THE HORSLEYS, SURREY.\*

ST and West Horsley, so far as any record exists, have ever been distinct villages. A tradition remains that the church at West Horsley stood on the green, and that it was nearer East Horsley with the intention of converting two parishes into one. But, if such an arrangement was in contemplation, it was never carried out.

The historians of the county have carefully catalogued the mansions of the various manors, but I have no intention to bore you with a tedious paper, for the beauties of nature in this month of May have far more interesting stories to tell, and pleasanter pictures to present, than can be culled from a library of musty tomes.

West Horsley the Norman Survey informs us that Richard, son of Other, holds Orselei, and that Brix held it of Edward. This Other was governor of Windsor Castle, and his descendants who continued to hold the property assumed the name of De Windsor.

Passing on for a couple of centuries, we find that in 1279 Ralph Berners was the possessor of the manor, and from him to son the property passed, until Margery, the last of the direct line, married John Ferriby, and afterwards became the wife of Sir John Bouchier, knight. Sir John's eldest son, Sir Humphrey, was slain at the battle of Barnet.

Later owner was Henry Courtney, Marquis of Exeter, by whose heirs the estate was forfeited, and on Sir Anthony's death it was shortly afterwards conferred. Sir Anthony, who was Master of the Horse to Henry VIII., married Elizabeth Fitzgerald. The Earl of Surrey sung of her in one of his sonnets, "Bright is her hair, and Geraldine she hight." His death took place in 1548, and his son and heir Anthony, who died at the manor house in 1592, was created first Viscount Montacute. The viscount had mortgaged the estate to John Evelyn, and to clear off the debt he parted with the property, and later we find it in the possession of Sir Nicholas Wotton, who, dying in 1643, bequeathed it to his nephew, Sir Walter Raleigh.

John Evelyn's diary under date August 10, 1658, we find "I din'd at Mr. Carew Raleigh's at Horsley, son of the late Sir Walter."

After Raleigh the estate was sold to Sir Edward Nicholas for £750, and from him it passed to the Westons.

on the staircases, and elsewhere. Many of the adherents to Charles I. obtained conspicuous places, and the Court beauties of Charles II., including Nell Gwynne, were not overlooked.

WEST HORSLEY PLACE.

As we pass through the rooms we may note the Marquis of Montrose, the Earl of Northampton in armour, the Earl of Stafford, Archbishop Laud at the age of sixty-four, Charles I., Charles II., the Earl of Clarendon, the Duke of Ormond, Sir Edward Nicholas, Lady Penelope Nicholas, Jerome Weston, the Earl of Portland with his Treasurer's staff, Queen Catherine, consort of Charles II.; Sir Walter Raleigh, Captain Perkins, John Weston with his wife and children, Henry Weston, Lady Aylesford, William Perkins, and others.

For many of the notes on St. Mary's Church, West Horsley, I am indebted to a manuscript compiled by Lady Rendel and the Rev. E. C. Unmack. When the first church was erected is not known, but a church is mentioned in Domesday Book, and a portion of the structure may be accepted as of that date. The chancel is Early English, the south aisle and chapel Perpendicular; the three arches are four-centred, a rarity in the churches of Surrey. The east window of three lancets with shafts between them and at the sides is regarded by Mr. Joseph E. Morris, M.A., as one of the most beautiful in the county, the single exception being the east window at Ockham. In this window two specimens of stained glass are preserved, which are believed to date from the time of Henry III. The one in the centre represents Our Saviour at supper, with Mary Magdalene wiping His feet with her hair, and in the north compartment St. Catherine is depicted released from the wheel of torture. In the north window of the chancel Sir James Berners is seen in a kneeling posture. He lost his head on Tower Hill. The wooden porch projecting from the tower is an unusual feature, and is believed to be at least 600 years old. On the outer wall to the west of the north doorway some small crosses can be traced, which may have been made by pilgrims. In 1810, when the then rector, the Rev. Weston Fullerton, spent 3,000*l.* on restoring the church, a small alabaster piece of sculpture was found under the brick floor. It measures 18 inches high by 12 inches wide, and represents the Nativity. In 1849, and again in 1887, various repairs were made in the church. A brass chandelier hanging in the nave bears the following inscription:—

Pour parvenir au royaume sans fin esper en Dieu.  
Martin Raizine et Anne Chacou son espouse, 1652.  
Fai a Namur par Pierre Rock, Maitre Fondeur de Cuivre  
et Potin.

Which Mr. Unmack translates:—

To gain the Kingdom without end, hope in God.  
Martin Raizine and Annie Chacou, his spouse, 1652.  
Made at Namur by Peter Rock, Master Founder in Brass  
and Pottery. (?)

This chandelier, Mr. Unmack conjectures, was brought over by a Huguenot refugee.

In the return of church goods made in the reign of Edward VI., which has been edited by Mr. J. R. Daniel Tyssen, we read:—

Item. Four great Bells in the steple, the best by estymacion xiiij*s.*, the rest under after that rate.  
Item. A sacring bell and a corse bell.

In Mr. J. C. L. Stahlschmidt's work on "Surrey Bells," the inscriptions on three are given:—

Bryan Eldridge made Mee. 1645.  
Guilemus Eldridge me Fecit. 1687.  
Bryan Eldridge made me. 1621.

WEST HORSLEY CHURCH.

anning tells us that Mr. Weston's house was commonly called the Sheep-leze, from the piece of land in front of the house on the other side of the turnpike road. The manor had been rebuilt by Sir Anthony Browne, and alterations and additions were made in the reign of James I.

Sir Edward Nicholas, on coming into possession, made an extensive collection of portraits, with which he decorated his house, and these still remain in the gallery, the billiard-room,

\* paper read by Mr. C. Wheeler at the first summer excursion to Upper Norwood Athenæum.

On this bell, which is broken, there is a heart between each word, and the first bell is decorated in a similar way. All these bells Mr. Stahlschmidt believes to have been cast at Chertsey.

The tablets and gravestones of a village church often tell the story of the manor, and it is certainly so at West Horsley. A few only I will mention.

On the north side of the chancel, in an enriched ogee arched canopy, is the recumbent figure of a priest. The arms denote that he was a De Berners, either Roger de Berners, rector in the reign of Edward II., or Randulphus de Berners, "clericus" in the reign of Edward III. A monument by Bacon to the Rev. Weston Fullerton, who was presented to the living by his cousin, Henry Perkins Weston, of West Horsley Place in 1770, is also here. In the south aisle there is a tablet of 1750 to James John Rendall and Jane his wife, who was daughter of John Weston, of Ockham. On the floor of the nave are two brass inscriptions, the one to Henry Darckham, 1504, the other to Martyn Whyen, 1516. In the Nicholas Chapel, which Aubrey stated was "appropriated as a dormitory of the family of the Nicholas's," there are monuments to Sir Edward Nicholas, knight, who purchased West Horsley Place of Carew Raleigh. Sir Edward was secretary to Villiers, Duke of Buckingham, when Lord High Admiral, and followed Charles II. into exile. His son Sir John held office under Charles II. and the three succeeding sovereigns. Sir John's wife, the Lady Penelope Compton, daughter of the Earl of Northampton, was killed at West Horsley Place by the falling of a chimney in the great storm of November 26, 1703. By the same storm Bishop Kidder, of Bath and Wells, and his wife, were killed in the palace at Wells. Another stone tells

EAST HORSLEY CHURCH.

of Susan Briscoe, daughter of Sir Randall Cranfield, knight, who died in 1636. The inscription runs:—

She left no issue for the childing bed,  
That gave her Death, brought forth an infant dead.

A marble slab let into the wall of the churchyard commemorates William Nicholas, son of Sir John, who bequeathed West Horsley Place to the Westons.

I have mentioned Sir Walter Raleigh, and have alluded to the Huguenots, and in this connection it may be interesting to note that in 1569 Raleigh went to France, and enlisting as a volunteer in the Huguenot army, took part in the battles at Jarnac and Moncontour. Of greater interest is the fact that, when Archbishop Parker founded the Society of Antiquaries Raleigh became one of its members. His wife was Elizabeth Throgmorton, a maid of honour to Queen Elizabeth. Their son Carew was born in the Tower of London, and on February 15, 1604-5, he was baptized in the church of St. Peter ad Vincula.

The historians of Surrey tell us that he died at West Horsley Place, and was buried in the Nicholas Chapel, but the latest biographers, Professor J. K. Laughton and Mr. Sidney Lee, to whom I am indebted for various facts, give evidence to show that he died at his London house in St. Martin's Lane in 1666, and on January 1, 1666-7, was buried in his father's grave in the chancel of St. Margaret's, Westminster. The register there describes him as having been "kil'd."

When Sir Walter was executed in Old Palace Yard on October 29, 1618, Lady Raleigh had his head embalmed and kept it in a red leather bag as long as she lived.

William Oldys, in his "Life of Raleigh," quotes a letter he had seen, written by William Nicholas, the last who owned Horsley, wherein he says he verily believes that the head he

saw dug up there in 1703 from the side of a grave where Carew Raleigh had been buried was that of Sir Walter Raleigh, there being no bones of a body to it, nor room for the rest of that side of the grave being firm chalk.

Frederic Schoberl, writing probably from the same accounts states that on digging a grave next Carew Raleigh's coffin skull was found in a niche in the rock of chalk, only just enough to contain it.

Now, as Carew Raleigh had sold the property, one would scarcely expect his burial to take place in the manorial church. His mother died in 1647, and at that time the grave was in his, and as I can gain no information as to her place of the thought arises that she may have found a resting-place at West Horsley, and if so, would it not be natural to suppose that Carew would place his father's head beside her?

A few notes about Carew may be of interest. In 1610 he entered Wadham College, Oxford, as a fellow commoner, matriculated on March 23, 1620-1, and his name continues

ENTRANCE TO (EAST) HORSLEY TOWERS.

the books until 1623. In 1635 he became a gentleman of the Privy Council. A Bill restoring him to blood passed through the House of Lords in 1621, but though it passed through Houses in 1624 the Royal assent was withheld until William Herbert, the third Earl of Pembroke, took him to court of James I., but the king complained that he looked like his father's ghost. In 1639 he was imprisoned in the Fleet, drawing his sword on a fellow courtier, and in May 1640 was committed to the Tower for passionate words spoken in committee. In Parliament he represented Haslemere from 1648 to 1653, and Carlyle states he was member for Callington at the close of the Long Parliament. He refused knighthood at the hands of Charles II., but the honour was conferred on his son Walter on June 10, 1629, and in the same year the manor of East Horsley was conveyed to Carew by the Earl of Southampton. His wife was Philippa (Weston), the widow of Sir Anthony Ashley.

The story of East Horsley extends as far back as the time of Canute, when the king permitted a Danish jarl named Thorkel to give Horsley to the use and support of the table of monks of Christ Church, Canterbury.

In the catalogue of religious houses attributed to Geoffrey of Canterbury, a priory of black nuns is mentioned as having been established there in the days of Richard I., or King John.

In Domesday Book, Horsley is described as belonging to the Archbishop of Canterbury for provision of the monks. The Rev. Arthur Hussey, M.A., states that the Metropolitan had a palace there, and until very recently the church was peculiar of the Archbishop of Canterbury.

A smaller manor, probably part of the other, belonged to the Bishops of Exeter, whose connection with Horsley is attested on two of the brasses. This manor was alienated by Bishop Harman in the time of Henry VIII, and since

ave been united, and Captain the Hon. Lionel Fortescue Noel, D.L., son of the Earl of Lovelace, is sole lord. Martin's Church was built in the twelfth century, and is Early English. The church is of flint; the old tower is repaired with brick and covered with stucco. The half-length brass of 1370 is believed to be of Bishop Thorne.

The beautifully-executed profile brass is to Bishop John de, of Exeter, who died in 1478. The inscription, as it appeared in the original, is given by Mr. Joseph E. Morris, as—

Quisquis eris qui transieris  
Sta, perlege, plora;  
Sum quod eris fueramque quod es,  
Pro me, precor, ora.

The translation, kindly made by the Rev. Septimus Pennington, M.A., runs:—

Whosoever thou shalt be who shall pass by  
Stand, read thoroughly, bewail;  
I am what thou shalt be, and I have been what thou art,  
Pray for me I implore you.

Portions of two other brasses are in the centre aisle. The one at the east end commemorates John Snelynge and Alys, wife, 1489; the other, at the west end, Thomas Snellinge and his wife, 1504.

The altar tomb in the north aisle is to Thomas Cornwallis and his wife. He was groom porter to Queen Elizabeth.

In the western window of the north aisle there are some fragments of glass bearing date 1573.

The bells are inscribed:—

Bryan Eldridge made mee. 1648.  
H.B. R.D. William Eldridge made me. 1703.

The third bell is marked:—

Sit Nomen Domini Benedictum.

The fourth is similar to the second.

The Eldridges, according to Mr. Stahlschmidt, were first established at Wokingham, in Berkshire. Afterwards they had a branch at Horsham, in Sussex; but the Surrey bells are believed to have been cast at their foundry at Chertsey, Surrey. The illustrations are from photographs specially taken by Charles Wheeler.

## CAMBRIDGE.\*

At the present time the area of the borough of Cambridge is 3,278 acres. The borough boundaries of Cambridge have not been extended for many years, in fact, I can find no record of their extension. In the reign of King John the boundary of the town was defined by the King's Ditch, which ran out of the river by Mill Lane and Pembroke Street, and ran round through the site of Sidney College into the river opposite Magdalene College, and the boundary of the town will be seen by studying the old map, No. 1, published in 1592.

An excellent idea of the appearance of the town at that period may be obtained by studying "Hammond's Bird's-eye View of Cambridge," published in sheets in 1592. Only a complete copy of this map exists, and that is in Oxford University. Individual sheets are sometimes to be met with, and by the kindness of the bursar of King's College, I am enabled to show one here. The time has now arrived when it is absolutely necessary to extend the boundaries of the borough, and it is proposed to extend them by enclosing portions of the villages of Chesterton, Cherryhinton and Grantchester with the town of Newnham. But for the shortsighted objection of those who derive all the advantages of close proximity to Cambridge this extension would have taken place before. The alteration of boundary, which must take place within the next few years, should about double the area of the borough and increase the rateable value by at least 50,000*l.* The population in full term is 41,655. The assessment for district purposes is 257,138*l.*, out of which the assessment of the town and university buildings is 25,593*l.*, or, roughly, 10 per cent. The rates amount to 5*s.* 2*d.* in the pound.

In the sixteenth century the accumulation of filth in the streets (into which refuse of all sorts was thrown), the housing of the town of cows, horses, cattle and swine, and the habit of driving them out into the streets in the morning (when the town herdsman, blowing his horn, came to drive them to the pastures and commons), resulted in plague and sickness. At the present time Cambridge, as befits a university town, holds a high reputation as one of the most healthy towns in England. A new sewerage system on the precipitation and filtration principle has just been completed at a cost of 168,000*l.* Street paving was always a source of trouble; at one time each householder was responsible for the repair of the street opposite his house, and iron-shod wheels and other

"evil engines" were forbidden. Tolls were levied on goods coming into the town to pay for the maintenance of the streets. The successive stages of macadam, granite setts and Val de Travers are now giving way to wood-block paving, which has recently been laid down from the station to the Post Office, a distance of 1,830 yards, at a cost of 15,517*l.* In early days householders were compelled to hang out lanterns outside their own houses to light the town, and in 1615 we find that the town crier was sent round on dark nights to see that this was done. There is now a Town and University Gas Company, and considering the cost of carriage of coal to Cambridge, the price of gas, 3*s.* 2*d.* per 1,000, is low. The Electric Light Company is one of the few electric light companies in England paying a dividend of 7 per cent. The system adopted is high tension alternating, the dynamos being driven by Parson's steam turbines. After the plague in 1564, Dr. Perne, master of Peterhouse, proposed that a fresh supply of drinking water should be brought into the town from the streams running from the springs at Nine Wells in the parish of Great Shelford, a distance of about 4 miles. The work was carried out at the joint expense of the town and university in 1610, under a scheme by Edward Wright, of Caius College, who planned the New River. This stream, called Hobson's Stream, supplies a fountain in the market place and also the baths of Emmanuel and Christ's Colleges. Thomas Hobson, the carrier, who was a large subscriber, is well known, for as a livery-stable keeper his name was the origin of the saying "Hobson's choice," his rule being "each horse in its turn and no choice," and his customers had to "take that or none." The fountain in the Great Court of Trinity College is supplied by a lead pipe carried for about 2 miles from a spring on the Madingley Road. The present water-supply of Cambridge is excellent, pure and inexhaustible, being derived from the lower green sand, and is pumped up at Fulbourn, a distance of about 6 miles, to a reservoir above Cherryhinton, the height giving sufficient head of water to deliver a jet from a standpipe over the top of King's College Chapel.

I think that we are justly proud of our open spaces in Cambridge, a fact which will be brought home to you by a glance at the spaces coloured green upon the plans of the town. The green spaces on the large plan on the wall show the open spaces and common lands which cannot be built upon, and these cover an area of 286 acres, out of a total area of the borough of 3,278 acres, *i.e.* about one-ninth of the whole of the borough, and are exclusive of college grounds and of the Botanical Gardens (36 acres), which also cannot be built upon. Twice within the last sixty years have proposals been made to the Corporation to enclose these commons, propositions which, for the sake of posterity, I am glad to say were successfully opposed. The principal open space is Parker's Piece (20 acres), which was obtained in 1812 from Trinity College in exchange for two pieces of land at the backs of the colleges. The following is the acreage of the several commons:—

	A.	R.	P.
Coldham's Common . . . . .	98	1	36
Stourbridge Green . . . . .	42	1	4
Midsummer Common . . . . .	57	2	1
Butt Green . . . . .	7	8	13
Parker's Piece . . . . .	20	0	35
Land between Parker's Piece and East Road . . . . .	4	0	20
Land between Mill Road and Queen Anne Terrace . . . . .	3	0	0
Land between Mill Road and Zion Place . . . . .	2	2	12
Queens' Green . . . . .	4	1	10
Laundress Green . . . . .	0	3	2
Sheep's Green . . . . .	22	0	20
Coe Fen . . . . .	13	1	22
Coe Fen Straits . . . . .	1	1	28
New Bit . . . . .	4	2	10
Empty Common . . . . .	5	0	9

The endowed charities in Cambridge include 102 almshouses with various grants to the inmates, in addition to homes for boys and girls; also about 275*l.* in apprenticeships, and a certain number of old-age pensions of 25*l.* a year each. Other charities include about 340*l.* a year to the poor, in addition to various charities for the distribution of coal, meat, soup, &c. There is little commerce in Cambridge, except in agricultural produce and in the retail supply, to satisfy the requirements of the town and colleges and the surrounding villages. The principal manufactures are bricks and cement, the geological formation enabling cement to be manufactured at a low cost from marl, without the artificial mixture of chalk and clay, which entails carriage of raw material from a distance.

A paper on Cambridge would be quite incomplete without some reference to the university and colleges, although I have no intention of, or space for, entering into any detail of the history of the university, or of dwelling on the architectural beauties of the individual colleges. The origin of the colleges of Cambridge is interesting and much misunderstood, the general impression being that the university is responsible for the existence of the town, but this is not so. In Mediæval times Cambridge being an important town monasteries sprang

A paper read by Mr. H. M. Jonas in Cambridge on the 22nd of the meeting of the Surveyors' Institution.

up, and we learn that in 1110 the Abbot of Croyland, in Lincolnshire, sent four monks, who came daily into Cambridge from Cottenham and gave lectures in a hired barn, and in a short time collected a large number of scholars; they afterwards took up their abode in the town, and gradually both teachers and scholars formed themselves into an association, electing their own governors, and subsequently acquiring the recognition and patronage of the sovereigns of England, who from time to time granted them various charters. Thus the university in the Middle Ages was a corporation of learned men, established for the purpose of teaching. They did not concern themselves with the feeding and lodging of the students, and the only buildings originally required were places for holding meetings, schools and lecture-rooms. The individual colleges have come into existence principally by private endowment, as from time to time benefactors were found who recognised the necessity of feeding and housing and encouraging the studies of the scholars at the university. From a surveyor's point of view, the importance of the Cambridge colleges lies in the fact of their being large landed proprietors. The university and colleges own a large number of estates in Cambridgeshire and in other counties, and not only do the colleges between them own about 127,271 acres, scattered over various counties, but they also own a number of houses in London and provincial towns, impropriated tithe rent charges and copyhold manors scattered all over England. The total income of the university and colleges from real estate (exclusive of funds) was returned by the University Commission in 1873 at 264,288*l.*, but at the present time it is, I fear, in consequence of agricultural depression, somewhat short of this amount.

As far as the town of Cambridge is concerned, the stake of the university and colleges in the town is of great importance. A glance at the large map which I have prepared, on which the university and college properties are coloured pink, will show that a very considerable area of the town itself and the surroundings belong to the university and colleges. I have prepared as accurately as possible a statement showing the number of houses and shops owned by the university and the colleges in the borough of Cambridge, and I find that there are 1,909 houses and shops belonging to the university and colleges, which are divided as follows:—433 houses which are let at rack rents; 832 which are let on long leases from 80 to 99 years; 644 which are let on beneficial 40 years' leases. These represent together about 22 per cent. of the total number of houses in the borough of Cambridge. The university is therefore naturally deeply interested in the welfare of the town, which is in a great measure dependent upon it, because Cambridge is practically the residence of a large number of landed proprietors with estates all over England, who naturally expend every year in the town a considerable sum of money, which is derived from various sources in other counties. The management of college estates will be of interest to surveyors. The agent of the college is the bursar, who is one of the Fellows appointed by the governing body, and his duties are to collect the rents, manage the college property generally, and to supervise the expenditure, reporting to and obtaining the sanction of the college meetings from time to time as necessity arises, and, if required, calling in the assistance of expert surveyors. As may be imagined, the supervision of the college estate is no light task, especially during the times of agricultural depression, but, thanks to the careful selection of men of ability for the position of bursars, the management of the Cambridge college estates is carried on in the most economical and business-like manner. All questions of purchase and sales of property of colleges go through the hands of the Board of Agriculture for approval, and have to be certified by the report of a competent surveyor. In consequence of the large area of land owned by the colleges in Cambridge, and the legal difficulties connected with the sale of college property, there are a large number of leaseholds in Cambridge, and freeholds are at a premium. Up to within the last forty years, ninety-nine years' leaseholds in Cambridge were unknown, and I believe the first ninety-nine years' lease was granted by Trinity Hall College in 1865. Previous to that, the custom was to grant leases for forty years, but since that date, the additional security afforded to a leaseholder by a ninety-nine years' lease, together with the increased ground rent obtained by the lessors, has almost put an end to the granting of forty years' leases, except in the case of renewals. I have shown on the plan hatched by red lines the principal ninety-nine years' leases which have been granted by the various colleges in Cambridge, and by blue hatched lines the position of the principal blocks of forty years' leaseholds.

As an instance of the ownership by individual colleges of property in the town, I find that at the present moment two of the colleges hold house property (apart from land and college buildings) as follows:—

*College A.*—Seventy-two houses and shops let at rack rents, 2,472*l.*

	Ground Rents.	Present Rental Value.
6 houses and shops let on beneficial 40 years' leases	15	434
92 small houses let on 80 to 99 years' leases	339	4,040
29 larger residences let on 99 years' leases	709	3,285

Total present income in rack rents and ground rents, 3,535*l.* Estimated future reversionary income on basis of present annual value of rack rents and reversions, 10,231*l.*

*College B.*—Seventy-seven houses and shops let at rack rents, amounting to 1,501*l.*

	Ground Rents.	Present Rental Value.
426 houses and shops let on 40 years' beneficial leases	1,003	14,698
63 houses let on 99 years' leases	667	4,439

Present income in rack rents and ground rents, 3,535*l.* Estimated future reversionary income, on basis of present annual value of rack rents and reversions, 20,638*l.* As an example of the rapid increase of building on ninety-nine years' leaseholds, it may be of interest to give the following showing the number of houses erected on the building of a third college, "C," during ten years:—

1889	3 houses	1894	13 houses
1890	10 "	1895	37 "
1891	14 "	1896	27 "
1892	15 "	1897	27 "
1893	21 "	1898	55 "

The ground rents of ninety-nine years' leases of course according to the position. The properties shown on the side of the river let at average ground-rents of about 30*l.* per acre for private houses, these being, roughly speaking, one mile from the centre of the town. The ground rents south of the town on the Trumpington Road average about 25*l.* per acre. The ground rents on the Lensfield Road Lyndewode Road vary from about 10*l.* to 7*l.* per acre.

The system of beneficial leases dates from earliest colonial history, and its distinctive feature is the granting of a lease, usually forty years, in consideration of a merely nominal rent, plus a fine or premium at fixed periods, in anticipation of the term in respect of which the fine is paid. Thus it has been customary to renew these forty years' leases at the expiration of the first fourteen years on payment of a fine amounting in most cases to about two years' rack rental value. The renewals being voluntary, the system led to a very large class of house being erected, and to the crowding of as many houses as possible into the smallest space in order that the lessee might make as much profit as he could get out of the property. On the other hand, the result of the system was that the college yearly income was uncertain and precarious, and the non-renewal or running-out of lease entailed loss of income to the Fellows of the college. Successive generations of Fellows have been the sufferers by this system, the continuity of which prevented posterity from participating in the revenue to which it was justly entitled. I may add that in many instances the lessees, not knowing whether the lease would be renewed or not at the end of the first fourteen years, in order to make as large a profit as possible out of the lease (the reversion of which they know belongs to the college), spent as little money as they possibly can upon repairs, and I met with many instances in which the property at reversion was only been fit to pull down, and the last holder of the lease considered it a very great hardship to have to pay a reasonable sum for dilapidations. I am glad to say that of late years a large number of instances, the Fellows of the colleges by self-sacrifice and to their own personal loss, studied the case who come after them by refusing to renew these forty years' leases, and allowing them to run out, or by increasing the ground rent instead of taking fines.

As in many other towns, property in the centre of the town of Cambridge has largely increased in value in the last forty years, of which I will give four instances:—

A house and shop sold in 1883 for 2,100 <i>l.</i>
A house and shop sold in 1891 for 3,000 <i>l.</i>
A house and shop sold in 1897 for 5,000 <i>l.</i>
A house and shop sold in 1885 for 3,750 <i>l.</i>
A house and shop sold in 1898 for 6,300 <i>l.</i>
A shop sold in 1864 for 2,500 <i>l.</i>
A shop sold in 1881 for 3,500 <i>l.</i>
A shop sold in 1864 for 924 <i>l.</i>
A shop sold in 1895 for 3,060 <i>l.</i>
A shop sold in 1897 for 3,620 <i>l.</i>

I have selected instances in which no large expenditure had been made during the periods quoted. I cannot say that the whole of the property in Cambridge has increased in value in every direction; the tendency of the increase of value is principally towards the centre of the town and towards

ray station. In Market Place, Petty Cury, Sidney et and St. Andrew's Street property has increased considerably in value, but property in Trumpington Street towards King's Parade has remained practically stationary. So far as residential property is concerned, the tendency has been towards decentralisation. Tradesmen who years ago were content to live over their shops now have separate houses on the outskirts of the town, and this greater desire for privacy has led to a greater demand for building land on the outskirts; moreover, the old class of houses crowded into a narrow space with underground kitchens and no bath-rooms, &c., has been abandoned in favour of modern houses. On the whole, the prosperity of the town and surrounding district is in a satisfactory state, and there is a much greater demand not only for houses, but for farms in the districts surrounding Cambridge than has been the case for many years. The slightly improved state of agriculture, ready markets, the land and a capital sporting neighbourhood, the district of Cambridge with its educational advantages cannot stand still, and I trust that this is the impression you will all carry away with you.

## RESERVATION OF CROSRAGUEL ABBEY.

At its dissolution as a Society three or four years ago, the Ayrshire and Galloway Archaeological Association writes the Ayr correspondent of the *Scotsman* part of a sum of money in hand for the purpose of preserving the ruins of Crosraguel Abbey from further decay. Prior to this, extensive operations at the ruins had been carried on by J. A. Morris, F.S.A. Scot., architect, Ayr, on behalf of the Association, with a view to determining the original extent of the abbey, and the results of these researches are contained in the second volume of the "Charters of the Abbey of Crosraguel," edited by Mr. F. C. Hunter Blair, and published by the Society in 1886. The abbey, with a few acres of ground attached, is the property of the Crown, and all that is now left to represent the extensive territories granted by Duncan, Earl of Carrick, at the beginning of the thirteenth century for the foundation and upkeep of the institution. The abbey is situated at the side of the public road between Maybole and Kirkoswald, about two miles from each, and occupies a site at the bottom of a shallow valley running towards Maybole. It is not a picturesque site, and one wonders what could have been the inducement to choose such an unlikely spot for the foundation of an important religious house. The name does not afford any definite clue, but it suggests the probability of some incident in the religious annals of the neighbourhood having taken place near the site, and that the foundation of the abbey was a commemoration thereof. What that incident may have been has completely faded from history, and even from tradition, for though there are numerous documents in existence relating to the foundation and subsequent history of the abbey, none of them throw any light on the subject. Indeed, the documents tend rather to obscurity than to elucidation on any point, for it has been pointed out by Mr. Hunter Blair that the name of the abbey is spelt forty-one different ways in these documents, and an examination of the charters shows how arbitrary was the method of dealing with the etymology of the name that within the compass of a single charter it is given in five different ways.

The building of the abbey was completed about the middle of the thirteenth century, and it was occupied by the monks until that time till about the close of the seventeenth century. It was, therefore, in their possession at probably a later date than any of the other religious houses in Scotland. The abbey was of the Cluniac order, and the ruins still bear the impress of their French origin. The buildings, as a whole, are more complete, and some of their parts in a better state of preservation, than the majority of similar remains in the kingdom; but they bear evidence of having been more than once altered and restored, and include scarcely a trace of the original structures. The principal parts of the abbey are the nave and choir of the abbey church, running east and west, and about 150 feet long, the belfry gable on the west, and the belfry with its surmounting cross, the sacristy, chapter-house, gate tower, and dove-cote (almost complete); but there is a large number of walls, arched roofs, fragments, and foundations that show the extent of the abbey, and indicate that it is of a very complete character as a monastic institution. The belfry gable is a curious anomaly in the scheme of the buildings, and no certain explanation has been given as to its existence. It is built across the church, cutting it in half. It is probably it may have been erected after the Reformation to form a church at the choir end, smaller in size and more easily kept in order. There is some warrant for such a view from the circumstance that the north end of the gable is built

partly across one of the original windows in such a way as to entirely block the window out from the choir end, and to leave the remainder open in the nave end. It was not uncommon for abbey churches to be used under the Episcopal and even under the Presbyterian régime. From the castellated structure of the wall heads of some of the buildings, notably the gate tower and its appurtenances, and from early engravings and documentary records, it may be concluded that the abbey was fortified, and that it was surrounded by walls, though no part of the surrounding walls now remain.

One of the most interesting parts of the ruins is that which contains the sacristy and chapter-house. These apartments form the ground floor of what had at an earlier date formed the south wing of the cruciform church. Above them are the scriptorium and library. The original roof of the structure has long since disappeared, but the groined ceilings of the sacristy and chapter-house are entire, and to this fact they owe it that their interiors are the best preserved and most homogeneous parts of the abbey. The arches of the ceilings are complete, and the sculpture and ornamental stone, which in the case of the sacristy is elaborate, are wonderfully preserved. The absence of a roof over the apartments above them, however, rendered it desirable that they should be still further protected from the weather, and it was at this important section of the ruins that the work of preservation was commenced. It may be here noted that there was no intention that the work should be other than preservative. The aim is purely in the direction of preservation, and if it is to a slight extent restorative, it is only incidentally so.

The first thing that was done was to raise the wall head all round to a level in red brick, and to place a flat wooden roof, ultimately covered with lead, over the building, to effectually keep out rain. The red brick on the top of the ancient walls certainly looks incongruous, but if it is not intentionally incongruous, the difference between the ancient and modern construction has been accentuated in order that there may not at any future time be the least likelihood of the protective work being mistaken for ancient work. The work will certainly serve its purpose of preserving the interior as far as that can be practically done. It is in connection with this part of the buildings that such restorative work as was thought desirable was undertaken. In the library there is a small quadrangular window overlooking the cloister court. It was divided into four lights by a stone mullion and transome. The transome was intact, but the mullion and lintel which it supported had disappeared. They were restored, and the window otherwise insured against further decay. The fireplace in the library was also slightly restored and otherwise protected. Three Gothic arched windows filled with tracery, one in the sacristy and two in the chapter-house, were also restored. Only parts of the original tracery remained, but sufficient to admit of its being completed, and with a view to the preservation of the fragments the tracery was filled in and the compartment glazed with leaded cathedral glass. The only original window that is complete, so far as tracery is concerned, is a very beautiful arched window in the north wall of the nave. It can only be said to be original, however, as being part of the abbey ruins as we find them, and it is found to be in a sense a window built within a window, that is to say, it occupies part of the space of an earlier and larger window, traces of which still remain. The dimensions of the original window had been curtailed, presumably to suit the height of the tomb of Lady Rowe, a great benefactress of the abbey, whose body was placed there when she died. The flat tombstone is now on the ground under the window, but its supporting wall pillars up to the sill of the existing window are still in situ. The tracery of the window is similar to that of the three restored windows, with this notable difference, that its transome is curved or arched over each of its two divisions, a feature that is very unusual if not unique in architecture.

The abbot's tower occupies in some respects a remarkable position. The abbey was built on a small burn, and there was a fish-pond before the burn entered the precincts of the abbey and another after it left them. The burn runs right through the abbot's tower, that is, through its west and east walls, with its north and south walls standing on the left and right banks respectively. Whether the tower was built over the stream, or the stream was led through the buildings while it was occupied by the abbot, or whether it broke through afterwards, there is no means of definitely determining; but such evidence as there is leads to the conclusion either that the tower was built over the burn or that the burn was intentionally led through the tower, and that it did not break through accidentally. It is difficult, looking to the contour of the ground outside the south wall of the tower, to conceive how the stream could even have had a channel there, and outside the north wall it is out of the question, other buildings intervening. There is, moreover, a significant sentence in the account of the abbey in "Grose's Antiquities," written in 1789, that seems to support the view now taken. The correspondent who wrote the account of the

abbey says, "This stream, it is thought, was conveyed under the very buildings." This appears to be probable from the fact, further, that the water does not appear to have entered the tower by a breach, but by an artificial opening, which is still apparent in the west wall down to the water's edge. For what purpose the burn was conveyed into the interior of the tower is matter for speculation, but there can be no doubt that to its agency is due the fact that the whole of the north-east angle of the tower, comprising about a third of the building, has been thrown down, and that it was threatening the overthrow of the rest of the building. Means have, therefore, been taken to counteract its effects. The course of the stream has not been diverted—it would be difficult to do that—but it has been slightly altered and lined with masonry and cement in such a way as to prevent the water in flood times doing any further mischief.

The upper part of the west wall and some of the interior masonry are still in a very worn state, and it is understood that if funds are available these will be strengthened. The gate tower, which, with the watch tower on the south-east corner, is four storeys high, is almost intact as regards its outer walls up to and including the battlements. The spiral stairs are also complete, with the exception of the three steps at the top. These three steps have been restored, and lead roofs have been placed on both the gate tower and the watch tower. Being formed within and below the level of the battlements the roofs are invisible from below, and the appearance of the structure from the outside has thus in no way been altered. The water from these roofs and from the previously mentioned one has been led carefully away from the foundations by means of cast-iron down-pipes, and by fireclay pipes underground.

In addition to these, the more important parts of the protective works, minor operations have been carried out. Among these was the clearing out of the old well in the cloister court, which was in a very dilapidated state, and the rebuilding of the walls with the original stones, this work to that extent being restorative. The old steps leading down to the water are still in position. One of the lower steps bears the inscription, almost as fresh and complete as when it was cut, "Dns Johannes Boyd me fecit." During the recent operations a large accumulation of rubbish was cleared away from the outside of the west gable of the nave, revealing a large elaborately moulded doorway filled with masonry, as well as the splayed foundation of the gable in an excellent state of preservation. As there was no trace of this doorway in the inside of the gable, which was not covered to the same height as the outside with fallen *débris*, there was nothing to show that the doorway existed till the outside was cleared. The doorway, which is a pointed arch, is a notable feature of the architecture of this part of the building. A great deal in the way of clearing away rubbish from various parts of the foundations, with a view to counteracting damp in the interior, has also been accomplished, and much of the walls, both inside and outside, has been pointed with cement. All the preservative work has been carried out by Messrs. D. & J. Milligan, builders, Ayr, under the superintendence of Mr. Morris. As a further precaution against the effects of the weather, and also against possible vandalism, wooden doors have been placed on the entrances to the sacristy and chapter-house and the gate tower, and a door has also been placed on the doorway leading into the library, though this can only be reached by a risky climb along the top of a wall. These doors are kept locked, the keys being in the hands of the keeper, whose cottage adjoins, and whose duty it is to show visitors over the place.

### THE NEW CHRIST'S HOSPITAL SCHOOLS.

ON Saturday several members of the Architectural Association visited the new buildings of Christ's Hospital at West Horsham, and were conducted by Mr. Aston Webb, A.R.A., and Mr. Ingress Bell, the architects.

The ground formerly belonged to the Aylesbury Dairy Company, and some of the buildings were converted into laundries, swimming-bath, gymnasium and boiler-house. There are two swimming-baths beneath one roof, that for the elder boys being 88 feet by 25 feet, and that for the younger boys 33 feet by 25 feet. The gymnasium is as yet unfinished. In the centre of the school buildings is a vast quadrangle, on whose four sides, surrounding the lawn, are dining-hall, chapel, school hall and science school, and, on two sides, cloisters. From this quadrangle on either side extend the eight school-houses, four to the east and four to the west, in a great arc. All the buildings are built of red bricks from Cranleigh and white Bath stone. The dining-hall, chapel, and school-hall are roofed with green slates, but all the other buildings with red tiles. Besides the six attached houses for masters, there are four detached houses. The eight blocks of school-houses, all of which are divided into two houses, lettered A and B, are named after "Old Blues." Among these names are Coleridge,

Lamb, Middleton, sometime Bishop of Calcutta, and Barrow. At the corner of each wing are carved in white stone Bluecoat boys. Above each entrance is a sundial, and beneath it an inscription, such as "Dum spectas fugit," "Fes lente," and the like. In the distance were to be seen the infirmary and the sanatorium.

Mr. Aston Webb, in addressing the visitors, said briefly, the idea in arranging the buildings had been to give the old scholastic quadrangle, with its closed corners and fined air, and so to build that sun and air could easily reach the living-room buildings. They had grouped the dining-school-hall, chapel and science school round one large quadrangle, which gave a scholastic character to the centre, either side from this quadrangle the houses extended as detached blocks, with ample spaces between them, and facing south. There were openings between the wings of houses and there was no possibility of stagnant air. There were eight blocks, each of which contained two houses, accommodation for fifty boys in each house, so that every block would hold 100 boys, except the last—the preparatory school which would accommodate 120. Thus the total number of boys accommodated was 820. There were no kitchen arrangements except in the small masters' houses and the great kitchen beneath the dining-hall. To that central point all the servants, matrons and others connected with the establishment would have to come at least three times a day for their meals. For the servants and others there were dining-rooms on either side of the kitchen, and for the masters their common rooms. Leading to the dining-hall was a subway underneath and connecting the houses, which could be traversed by the servants and thus avoiding contact with the boys. This subway was used for the conveyance of the steam pipes and other necessary apparatus. There had been very little alteration in carrying out of the original plans. The infirmary and sanatorium were as originally designed, and there were no rooms in any of the houses. Any boy who was ailing would once be sent to the infirmary. The masters were housed partly in boarding-houses and partly in detached houses, the latter being provided for masters who were married. In one of the two houses which formed a block a housemaster and an assistant master were accommodated with a room and bedroom. The headmaster's house was by the entrance to the quadrangle, so that everyone coming or going to the main approach would pass it. They had had to supply water, drainage, heating and lighting. The drainage was disposed of by the septic-tank process, and two mains through the subway and out to the filter-beds. As to water supply, the well used by the Aylesbury Dairy Company affording insufficient water, it had been deepened to a depth of 480 feet or 490 feet, and now a magnificent supply of very soft water was pumped up from the boiler-house to the reservoir on Sharpenhurst Hill, which held 300,000 gallons. From this reservoir it was conducted down to the large water-tower in the centre of the school buildings, which held 25,000 gallons, and thence it gravitated into the various cisterns throughout the buildings. These cisterns held another 25,000 gallons, that in the buildings they would have two days' supply of water, and in the big reservoir two weeks' supply. Lighting was entirely electric, and the electricity was generated at their own station, where there were three dynamos. All the heating was done from the boiler-house, where there were two boilers always at work, and a third boiler as a lay-by. The steam mains were brought through the subway, which extended to this point. At each block of houses and at each of the other buildings the steam was taken into a calorifere, where the water was heated, and that each establishment had its separate circulation of water more or less under its own control. The system was working extremely well. It was only fair that he should say that a great many more brains and hands had been at work than these buildings besides those of the architects. First foremost were the builders, Messrs. Longley & Co., of Crawley, who had done their work extremely well; he must mention also Mr. Proudfoot, clerk of the works, and Mr. Tingley, a man; Mr. Massey had helped them with the electric lighting; Professor Robinson had advised on the steam arrangements and water supply; Mr. H. E. Milner had laid out the whole of the grounds and roads; Mr. Frith had done the greater part of the architectural sculpture throughout the buildings, and the reredos in the chapel was partly his work and partly that of Messrs. Fagan & Bell; Mr. Hellyer had done the whole of the plumbingwork; Messrs. Clements & Jeakes were responsible for the heating; and Mr. T. R. Spence was doing the glazing of the windows in the chapel. As far as they could, they had brought all the old interesting relics from Newgate Street. The shingles in the windows of the dining-hall came from the old dining-hall, only they had had to intersperse them with plain glass, as in the present hall there was so much more window-space.

The visitors were then conducted over the interior of the buildings. The classrooms are commodious and suitable, in every case the windows are on the left-hand side of

The dormitories, each accommodating twenty-five boys, contain 800 cubic feet of air; at either end are the lavatories, in each dormitory are two little enclosures which form two rooms for "Grecians." In each house there are two staircases. The art school is well lighted and spacious. In the library is placed, above the mantelshelf, the picture of Edward VI granting to the hospital the charter of incorporation. The chapel is as yet unfinished, although the reredos, of the thankoffering of the "Old Blues," has been erected. The roof is of Oregon pine and the fittings of oak. The old organ, which has been repaired, will still be used. The school is large and lofty, and the entrances and exits are so placed that it can be quickly filled or emptied.

## ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute of Architects was held on Monday evening last, Mr. W. Emerson, president, in the chair. The decease of the late Mr. H. D. Shepard was announced. He was elected Associate in 1867, and won the Institute Medal for Essays in 1869.

Mr. T. H. MAWSON read a paper on

### The Unity of the House and Garden,

of which the following is an abstract:—

He explained that the paper bore entirely upon the country house, and although his remarks would in general be true to the town, and be concentrated chiefly upon the union of the house and garden, he purposed to dig deeper and examine the foundation upon which every successful scheme of habitation must necessarily rest. Every truly pleasant, healthy, successful abode must rest upon considerations deeper than stones or bricks and mortar, trees and flowers. At no time, if the scheme is to be successful, can the house and the garden be divorced from the surroundings; all must be viewed together in unity.

Where there is perfect freedom of choice, the three great considerations in deciding upon the site and position of a house are climatic conditions—i.e. whether the prevailing character of the air is humid or dry; the nature of the subsoil, whether gravelly, gravelly, or clay; and the aspect—for no matter what prospect offers, it is unwise to build upon the north or south-west or north-east side of a hill or knoll. The nature of the subsoil is a point needing more than ordinary caution; not only the site of the house itself, but the immediate surroundings should be tested. For health, beauty, luxuriance and ultimate happiness select a site with an under-stratum of gravel or marl and a good surface-covering of loam.

The first great question to be decided is, Are purely artificial considerations to be all-sufficient, or are the artificial considerations to hang upon, and be guided by, the larger aspect fixed by nature? The pure, healthy mind recognises that those who have built well and lastingly have been willing to make personal display and selfish interests subservient to and harmonise with their chosen surroundings. Such a mind respects local customs in building and local material, and indigenous trees and shrubs and acclimatised flowers in planting, making them the characteristic keynote.

The architect and garden designer must realise that the house is the precious thing, and not the garden; that their part is to give to the endearments and necessities of home a suitable expression and dress; their efforts must be concentrated upon the scenic part of the play, true, real and human, to be enacted therein. The needs of the proprietor should be clothed with a character to accord with the surroundings and expressive of his status. The impressions and inspirations of the spot should guide the architect and the garden designer both in respect to the preparations of the plans and also of the relations and of the garden scheme. Given a house designed by itself, without reference to its fixed, unalterable surroundings, and the garden designer has a well-nigh impossible task imposed on him. In the absence of a skilled designer, where the laying out of the garden is entrusted to the local nurseryman, the unity of the house and garden may still be secured, for it is open to the architect to suggest in the most unmistakable manner by his plan the general laying-out of that portion of the site which is nearly concerned the architecture. This point was illustrated by reference to two alternative sets of plans suggested for the same site, it being shown that the approved plan, with a little help from the elevations, had determined the character of the immediate surroundings of the house. Other examples were cited, and the plan and general arrangements described to show how easy it is to make the happy combination of house and garden impossible. Seldom when a plan of a country house is given do we find any indication of the compass points thereon. This consideration deserves more attention than it receives. Its absence suggests the idea of convenience and skilful planning are everything and aspect secondary or nothing.

The author brought the several considerations dealt with in his paper to a head by describing his plan and treatment of gardens on the top of Flagstaff Hill, Colwyn Bay—a site including within its twenty acres almost every difficulty with which the garden-maker could have to deal. The site commands an extensive panorama of sea and landscape scenery, and the proprietor wished the house so placed and planned that he should not only obtain the best views from each room, but also that he should have the best aspect (a great difficulty, considering the direction of views), ensuring the rooms being as sunny as possible and securely protected from the wind, and be able to find a sheltered walk on which to promenade from whichever direction it might blow. The plans exhibited showed how the first conditions were met, all the entertaining rooms excepting the morning-room, which only obtains the morning sun for a very short time, and the billiard-room, on which the sun falls a little after midday, complying. The condition as to protection from the wind was the most difficult to meet. The two prevailing winds are from slightly south to west and east to north. The stables, lodges, cowsheds and kitchen wing made an ample protection from the first, but the second could only be partially guarded against. The curved drive was well protected, the ground between the walk and the kitchen garden having been raised 14 feet or 15 feet, and planted with maritime pines, Scotch firs and evergreen oaks. The latter will in years to come give the best possible protection, without growing so high as to obstruct the view from the house. In its original state there was an entire absence of shelter, but proper treatment had resulted in a garden as sheltered as it was sunny, and as shady as any in the valley below. In the next plan the main and lower terrace and fountain garden came naturally in front of the entertaining rooms and the tennis-lawn on the west; the kitchen-garden, generally the most perfect part of all, was in direct communication with the terrace. There, within the high walls, could be found shelter from the winds; here one could pluck the earliest flower and the last rose of summer, the most delicious strawberry and the most luscious plum.

A country house and garden are impossible without an orchard; one cannot think of an orchard without realising how beauty waits on use. Preferably its position should be near the kitchen garden. Plant regularly in straight rows; do not mix cherries and apples, pears and plums too much, but try to obtain effect by grouping each together. The orchard, however, is by no means the end of the garden. Away in the hollow is the lake, margined with water-hawthorn and water-lilies. On its banks are knolls of oak and masses of rhododendron, interspersed with wild gardens and glades of grass. In conclusion it was observed that the paper had referred specially to neither the formal nor the landscape school. There was work in plenty for both; the help of both was needed. If we could divest ourselves of some of the prejudices called schools, and devote our energies to earnest and unstinting study, and apply that study to the perfection of our craft, and if we could allow our professional jealousies to give place to a spirit of mutual helpfulness, we might yet do something to advance the peaceful arts of our country.

A vote of thanks, proposed by Mr. MILNER and seconded by Mr. W. G. WILSON, was passed to Mr. Mawson for his paper.

## THE DICTÆAN CAVE.

AT an ordinary meeting of the Anthropological Institute on Tuesday papers were read by Mr. Hogarth on the "Excavations in the Dictæan Cave in Crete," and by Professor Boyd Dawkins on the "Animal Remains in the Dictæan Cave."

Mr. Hogarth said that the cave was undoubtedly the ancient cave—the seat of Zeus's legendary birth. It stood near a lake bed, which had a subterranean outlet. The cave was exceedingly rich, but little evidence existed of Mycenaean or pre-Mycenaean times; nearly all the remains were subsequent to that period. The skulls found were clearly of sacrificed animals. A number of pictures on the screen illustrated the excavations. The honours of Dictæ had been usurped largely by the cave of Ida, but the former showed a variety of ancient objects of the Stone Age—symbolical axes of fractional size—and others, a massive Mycenaean wall, and a few specimens of Hellenic and Roman work.

Professor Boyd Dawkins dealt with the geological aspects which led to inferences of the high antiquity of the cave. He showed specimens of skulls and horns, and among them a skull of an ox, to which he had found no exact parallel. He had, therefore, felt disposed to classify it as a member of a distinct species, to which he gave the name of the *Bos Creticus*. Another skull, in some respects varying from all existing specimens, he inferred to be that of a domestic boar. The preservation of these skulls, apparently for ornamental purposes, was a singular note of modernity in prehistoric times. These remains, the only ones in perfect condition, were of

sacrificed animals—the goat, the ox and the hog. The other remains were fragmentary, odds and ends, broken bones, including a single representative of a dog's upper jaw. Of all these specimens sent him by Mr. Hogarth he could not affirmatively state the precise or approximate date. With due deference to Mr. Hogarth, he would like to ask whether some other divinity than Zeus might not have been worshipped in this cave, possibly Aphrodite. Certainly here the double-axed Zeus was worshipped, but there was reason to believe that some other deity was also worshipped.

Mr. Hogarth said that he had excavated another settlement at the end of the Dictæan cave, the little wastrel settlement of Zachro. In two caves he found human bones, and what seemed to be cists like those of the Ægean islands of the prehistoric period. In one cave he lighted on five burials. One cist burial was untouched, including a new kind of pottery more regular than the Neolithic pottery. The vases tended to show the existence of a native pottery lineally following the Neolithic period.

Professor Boyd Dawkins then described the skulls sent him by Mr. Hogarth in detail. The teeth were wonderfully small and some of them decayed, and these and other circumstances led to the inference that they belonged to a highly developed civilisation. Decayed teeth were, unhappily, a mark of an advanced culture. Modification of life led inevitably—as his researches in zoological gardens showed—to a corresponding modification of skull and teeth. The skulls found in Crete seemed to correspond with the older skulls of Attica and Asia Minor. The people interred in this case were, he thought cognate with the Iberian race, long headed, probably of small stature, dark-haired, non-Aryan, and stretching back to the Neolithic age. It was possible they were Pelasgi, but he would not rashly speculate on that question. Certainly Greek civilisation appeared to be based on this pre-Aryan civilisation.

Professor Flinders Petrie noted correspondences from Egypt—e.g. the hanging of skulls as ornaments—with what had been said of Crete. There was, he believed, an invasion of Egypt, of which remains existed like what had been described. These bucrania were a traditional form of ornament from 5,000 B.C. in Egypt, and a connection in this respect seemed to be established between Crete and Egypt. It was indeed interesting to note the indications of a pre-Aryan civilisation in the Mediterranean, and one would like to know whether the use of bronze had been discovered in those at present somewhat dim and distant days.

### GENERAL.

**Princess Henry of Battenberg**, having suggested that the beauty of the monument to be erected in Newport as the island's memorial to Queen Victoria would be greatly enhanced if the figures of "Sympathy," "Fortitude" and "Dignity," with the lions couchant at the base of the column, were executed in bronze instead of stone, as originally intended, the memorial committee, with the object of carrying out Her Royal Highness's wishes, have opened an additional subscription list.

**The Late Mr. Benjamin Weir** has bequeathed funds for the erection of a hospital on the site of his former residence in Grove Road, Balham.

**An Exhibition of Works** by Florentine Masters in the fifteenth century will be held in the Carfax Galleries during June and July.

**The Annual Meeting** of the members of the Art for Schools Association was held on Wednesday.

**M. Jean Baptiste Paul Lazerges**, Algerian painter, died at Asnières at the age of fifty-seven. His works always attracted attention at French exhibitions and were chiefly of twilight effects.

**The Will of Mr. Astley Vigers**, of Messrs. Vigers & Co., 4 Fredericks Place, Old Jewry, surveyors, has been proved at 7,467*l*.

**The Provost and Fellows** of Oriel College, Oxford, have purchased a portrait of the late Mr. Cecil Rhodes, painted by Mr. Tennyson-Cole.

**An Exhibition** of pottery and porcelain was opened in the Fitzwilliam Museum, Cambridge, on Monday, and will not be closed until June 14. There are nearly a thousand pieces, which have been lent by residents in the neighbourhood. One of the examples is a large Dresden chandelier which was made for the drawing-room of Buckingham House before the building was purchased by George III. for a palace.

**Messrs. William Brown & Son**, the contractors for the new Midland Railway Hotel at Manchester, obtained an apology from the proprietors of the *Daily Mail* for stating that the contract had been given to Mr. James Stewart, of Messrs. Stewart & Co., the American contractors.

**M. Jules Didier**, whose large frieze relating to agriculture was published in *The Architect*, is an engraver as well as painter. He has produced a plate from the portrait of Adolphe Thiers by M. Bonnat, which has been presented to the Louvre for publication.

**M. Rodin**, the sculptor, is about to visit Prague, where exhibition of his principal works has been inaugurated.

**Mr. George Lambert** has been appointed by Cardinal Vaughan to be honorary curator of all the works of art of new Westminster Cathedral and of Archbishop's House. The collection of paintings is a very valuable and interesting one, including those on wood of the fifteenth century and beautiful *Assumption*, attributed to Murillo, of the estimated value of 30,000*l*.

**The Congress** of French architects will be held in Paris next week from Monday to Saturday, and as usual of late years the meetings will be in the hall of the Hemicycle of the École des Beaux-Arts. On Thursday there will be an excursion to Sens and to Villeneuve-sur-Yonne.

**The Chapel** at Girton College, Cambridge, was opened Friday. Like the rest of the college, it is from the designs of Mr. Alfred Waterhouse, R.A., and Mr. Paul Waterhouse. The interior is very simple, with a wooden roof, having hammer beams that terminate with carved shields, and these, as well as the oaken panelling of the chancel and inscription over the entrance, are the work of students of the college.

**A Conference** is to be held at Havre during next week by representatives of the proprietors of house property throughout France in order to take measures for the defence of their rights which are supposed to be jeopardised by various projects of new laws.

**The Financial Board** of the University of Cambridge have been authorised to purchase about 6 acres of land in Downing Street for the erection of buildings for university purposes. The annual rent-charge is to be 120*l*. per acre.

**The Royal Institute of Painters in Water Colours**, Piccadilly, will be open for ticket-holders on Sunday next from 2.30 to 5.30 P.M.

**Mr. Wigham**, who is travelling in Arabia, informs the *Morning Post* that the mass of brickwork which is declared to be the remains of the Tower of Babel is of later date. According to him it was Nebuchadnezzar who built the strange pyramid making it of unbaked brick with a thick case of burnt brick outside. The whole is pierced with air-shafts like pigeon-holes apparently for the purpose of drying the bricks. Whether the square sides were originally continued to the top or whether there were steps towards the summit has not been decided.

**Messrs. Doulton** have now an exhibition of pottery at the galleries on the Albert Embankment principally for the benefit of colonial and other visitors.

**The Candidates** for the membership of the Académie des Beaux-Arts rendered vacant by the death of M. Coquart are: M. Charles Gérault, architect of the Petit Palais; M. Guadet of the Post Office; M. Laloux, of the railway station on the Quai d'Orsay, and M. Rémon, of the Rubens Gallery.

**The Archbishop of Canterbury** on Monday consecrated the new chapel at Tonbridge School. It is designed by the architect, Mr. W. Campbell Jones, to seat 500 persons. The bays, cloisters and permanent vestries, however, remain to be added when funds permit. The total cost will amount to 23,000*l*. or 24,000*l*., of which some 9,000*l*. has still to be raised. The length of the completed building will be 156 feet internally by 41 feet wide, and the height from the floor to the top of the arched ceiling is 58 feet.

**The Board of Management** of the Manchester Royal Infirmary are able to announce, on the authority of the sub-committee, that the plans for the buildings will be ready by June 17. Owing to the Coronation festivities it was considered that a delay should be allowed before considering them, and the meeting will accordingly be held in the third week of July.

**Marble** is said to have been found in Prince Edward Island, Alaska, which is comparable in colour and texture with Carrara marble.

**M. Bouguereau**, as president of the Society of French Artists, has handed to the French Minister of the Colonies 10,000 francs in aid of the distress in Martinique which has followed the volcanic eruption. The Paris Society of American Painters have subscribed 200 francs.

**Mr. Alexander Graham, F.R.I.B.A.**, the assessor appointed by the President of the R.I.B.A. to adjudicate on the plans submitted in competition for an infirmary at Leigh, has made his award as follows:—No. 1. In order of merit. Design No. 51. Scheme 2. J. C. Prestwich, Leigh, Lancs. No. 2. In order of merit. Design No. 27. Authors, Harry W. Pye, A.R.I.B.A., & Roger F. Bacon, A.R.I.B.A., 16 John Street, Bedford Row, London, W.C. No. 3. In order of merit. Design No. 3. Authors, T. A. Buttery, F.I.A.S., & S. Birds, Exchange Buildings, Queen Street, Morley. Fifty-two sets of drawings were submitted.
